

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

300 Miles in under 300 Minutes!

The *Indian* Motorcycle

On June 20, C. B. Franklin riding a 7 H. P. Indian covered 300 miles in 282 minutes, 31 $\frac{3}{5}$ seconds.

This achievement was part of a record smashing performance of six hours' duration on the Brooklands Track in England.

At the end of two hours Franklin had covered 131 miles, 1,735 yards, and his distance for six hours was 1,725 yards.

World's record for a motorcycle run over two hours during this run. Average speed over 62 miles an hour, and the only motorcycle

on the Road!"

ANY BICYCLE REPAIR SHOP CAN MAKE YOUR WHEEL SAFE!

The Corbin Coaster Brake

can be fitted to the rear hub of your wheel within fifteen minutes. You owe it to yourself and others on the road to insure instant and absolute control of your machine at all times.

Steep hills, sharp turns, railroad crossings and dark nights have no terrors or risks for the rider whose wheel is Corbin equipped.

The Corbin Two-Speed Coaster Brake and the Corbin Duplex Coaster Brake are recognized everywhere as the standard safety and control devices for bicycles.

The Corbin Brake for motorcycles is part of the equipment of over 40% of all the motorcycles in use in America today. Insist on it if ordering a motorcycle. Better be safe than sorry.

You can get Corbin Brakes at all live hardware and bicycle dealers. Dealers: Order from the Jobber.

Where they come from

We're Busy!

DAY and night, our big plant is kept going, trying to keep up with the tremendous rush of orders which come pouring in daily.

But as long as the R-S machine is made with the painstaking care now employed in its manufacture, the ***demand will always exceed the supply.***

We are not letting this rush of orders turn our heads. We have had too much experience for that. It is at

such a time, when the demand is at its height, and machines are hurried to keep up with orders—then it is that little mistakes are permitted to creep in—little imperfections overlooked; inspections slurred.

But in our plant, no matter how great the rush, intense concentration on the work in hand—rigid inspections—absence of waste-producing haste—are the order of the day.

READING STANDARD COMPANY

306-340 Water Street, Reading, Pa.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

We're Very Busy!

YOU see, we figure this way. A little delay is soon forgotten, especially when a machine gives the supreme satisfaction that an R-S affords. On the other hand, immediate deliveries avail nothing if, at every turn of the wheel, new faults are found, imperfections come to light, evidences of hurried careless manufacture are discovered.

Every R-S is made with the absolutely accurate pre-

cision which only high grade machinery, skilled labor and keen inspections can give.

Combine the undoubted fundamental superiority of the R-S with our policy of making each machine "the" R-S and not merely one of a lot, and you have the basis of our claim that the R-S is THE FINEST MOTORCYCLE IN THE WORLD.

Let us tell you more about it.

June 17th, 1912.

Motorcycle Illustrated, 51 Chambers St., New York, N. Y.

Gentlemen:--Thank you very kindly indeed for the three copies of the Motorcycle Manual which were received Saturday. I am giving one of these to Mr. J. S. Steuer, our Pacific Coast Musselman Coaster Brake Missionary, and another to Mr. E. W. Adams, our Pacific Coast Representative. The clothbound copy you may rest assured the writer will zealously guard on his own desk, and if you have not already sent to him we would appreciate very much if you would let us have one copy for our Mr. W. K. Aurandt, and another for our Mr. E. J. Cortines, our Southern Salesman, and the third for Mr. W. M. Sheets, our Central West Coaster Brake Missionary.

The writer has looked the Manual over and wish to congratulate you, as it is certainly a valuable compendium of information, and I do not see how anyone who might be interested in motorcycles could afford to be without a copy.

With best personal regards from the writer, we are

Yours very truly,

THE MIAMI CYCLE & MFG. CO.

Val-JM.

F. L. Valiant, Assistant Sales Manager.

THE MOTORCYCLE MANUAL

Is the LAST WORD on the subject of a publication giving comprehensively and in a handy form ALL the information required by a motorcycle rider or dealer. 104 pages, printed on coated paper.

Motorcycle engine and frame parts illustrated and fully described—their functions fully explained, with a remedy for every possible trouble.

It also tells you how to tour; gives the motorcycle laws of every state; official racing records, hill climbing, horsepower and other formulae, and a complete directory of the motorcycle trade. Pages are magazine size, 7 x 9 inches.

Paper covers, 25 cents, postpaid.

Cloth bound, 50 cents, postpaid.

Special prices on lots of 10 or more

For \$1.25, we will send you a copy of the Motorcycle Manual and also enter your subscription to Motorcycle Illustrated for one year

EXCELSIOR LAUTO-CYCLER

July 10th begins the third year of unvarying success for the Excelsior Twin

And the engine on the Excelsior Twin you buy today is practically the same as that of the first Twin we turned out July 10, 1910. This is not because we have stood still, but because our previous experience insured the Excelsior Twin engine would be right before we put it out.

The Excelsior Twin has proved itself to be as good as we hoped—as good as the Excelsior single. It has led the field in speed, reliability and economy. All Excelsior speed records have been made with the same design motor as the stock Twin.

The first Excelsior Twin we built has covered 47,000 miles, and it is still going. The 1912 engine is just as good—more than that, we contemplate no change in our engine for 1913.

Get an Excelsior and you can be sure you have the most in speed, reliability, comfort and economy that the motorcycling industry can give.

EXCELSIOR MOTOR MFG. & SUPPLY COMPANY

2201-2259 UNION STREET, CHICAGO

A Chain of Evidence "The Coventry" Chain

Speed

Through the gruelling test of the track and the hill-climb, "The Coventry" Chain comes unscathed. "The chain with lightning speed" has time and again demonstrated its superiority, and for noiseless, frictionless action "The Coventry" Chains are efficient plus.

Strength

Can you imagine a more terrific strain on a motorcycle chain than that of a speed of 52 miles an hour up-hill? That's the time O. C. Godfrey, the Tourist Trophy Winner, made at the Mt. Anglaust Hill Climb at Collomiers, France. It must be admitted that such terrific speed puts an undue strain on the transmission. But "The Coventry" Chains, with a breaking strain of 3,600 pounds to the foot make light of a task such as this.

Dealers—Write

Sarco Engineering

112 Broad Street

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED

ence in Favor of ventry" ins

Endurance

It's the day in and day out kind of service that a man demands, and often does not get from his chain. For plugging road work, for the terrific strain of negotiating mud and sand and snow, "The Coventry" Chains are eminently fitted. They are the product of years of chain manufacturing experience, high class material, keen inspections and merciless tests on the road. Every Coventry Chain is well worked in before it reaches the buyer. Each chain undergoes at least 2,400 inspections before it is pronounced O. K. That ought to satisfy YOU.

Distinctiveness

"You can't mistake the shape." At the end of each link of "The Coventry" Chain is an elliptical projection. This "nose" serves to distinguish the chain at all times. It also serves another and more important purpose—it positively adds twenty per cent. to the life of the chain. This projection is formed by a reinforcement at the end of the inside plate, a double thickness of steel is employed at this most vulnerable point of the chain. This is an exclusive feature, and to be found only on "The Coventry" Chains.

The 20th Century Limited

Two Leaders of America

SEARCHLIGHT No. 108, showing back closed.

LIKE the 20th Century Limited, *20th Century Lamps* are recognized as the leaders in their field. They can be depended upon to see you safely to your destination through the darkest night—reliable and efficient always.

20th Century Lamps are constructed on the same principles as the Big Naval Searchlights—they are made to project a powerful ray of light for a long distance straight ahead (the only direction where the light is needed to avoid danger).

Another Point: The cleaner the lens, the more brilliant and powerful the light. The "Open-door-to-the-lens" feature of 20th Century Lamps permits easy access to the lens for cleaning purposes.

The experience of expert lamp manufacturers of a quarter of a century, guarantees the mechanical perfection of 20th Century Lamps, both bicycle and motorcycle. 20th Century Generators are perfect in point of efficiency, appearance and compactness. They can be readily opened—no screw-threads to become crossed or tightened.

READ THIS STRONG TESTIMONIAL:

BEATRICE, Neb., June 26, 1912.
 Twentieth Century Manufacturing Co., 422 Ogden street, Newark, N. J.
 GENTLEMEN:—I have used a No. 2 model of your lamps for over a year, and it has given splendid satisfaction. I have had experience with the Solar, Searchlight and Columbia lamps, but I have never had as good a lamp as yours. It gives more light, and I have less trouble with it than with any of the others. Let me know what a No. 6 model will cost me delivered to Beatrice. The dealers here do not carry your lamps in stock. I don't know why, because I think it is the best lamp on the market. Thanking you, I am,
 Very truly yours,
 L. J. KOEFF.

Reasons why the Henderson is sweeping all before it

7 h. p. 4 Cylinders; free engine, chain drive—\$325.

HENDERSON MOTOR CYCLE

It is no task to explain the widespread grip the Henderson has taken on the nation's motorcycle business.

It is due to the Henderson's advantages of no noise, no vibration, little or no road shock, no waste of power and a motor flexibility rivaled only by that of a four-cylinder automobile.

These, in turn, are the results of structural features not found in the ordinary motorcycle:—

The powerful four cylinder motor; its suspension low in the frame; the clutch which makes it a free engine; the starting crank; the long wheelbase; the low saddle position; the range of spark control, 60 degrees instead of 20, etc.

These are the features that no motorcycle of the Henderson's price has ever before offered.

These are the features that appeal mightily to the public; things the public really wants.

So the Henderson gives the motorcycle buyer the sort of a machine he has waited for.

Is it any wonder that the factory is unable to keep pace with the demand?

Is it any wonder that every Henderson dealer is happy and satisfied?

These results are the results that logically should follow the production of a machine with so many exclusive advantages, of such reliability and such high quality.

We shall be glad to send literature and answer all questions.

OLD SOL

"The Sun's Partner"

A feature of the "Old Sol" lamps to which we want to call special attention, is its adaptability. The needs of the most discriminating motorcyclist are sure to be met by one of our numerous models.

If his taste runs to self contained lamps of moderately strong power, there is our "Old Sol" No. 4, throwing a light of 400 candlepower strength. Price of No. 1 Lamp, with Brackets, \$5.25

Then if he wants a lamp whose light is positively the strongest, the most intense and farthest reaching on the market, we offer our "Old Sol" No. 8, throwing a light equal to 1500 candlepower, the brilliancy and intensity of which can only be equalled by a few automobile lamps. No other lamp manufactured for motorcycle use can compete with "Old Sol" No. 8. Price of No. 8 Lamp, with Brackets, \$7.50

Dealers—The "Old Sol" line is Your Line.

"Don't be alarmed:
he has WEED
CHAINS too!"

Oh!

NECESSARY FOR THE MOTORCYCLE - AS THEY ARE NECESSARY FOR THE AUTOMOBILE

Necessity is the Mother of Successful Invention

THE insistent demand for a Motorcycle Anti-Skid Chain proved to us that it was a *necessity*. We have therefore produced **Weed Anti-Skid Chains for Motorcycles**—just as perfect in principle, construction and workmanship as **Weed Anti-Skid Chains for Automobiles**, which are so recognized as a tested, tried and time honored necessity that we are now *manufacturing and selling over forty miles of Weed Chains every day in the year*.

Weed Anti-Skid Motorcycle Chains

With the "Creeping Grip"

Give perfect traction, *prevent skidding and slipping*. Make motorcycling absolutely safe—sixty miles an hour—with perfect safety—make *all roads good roads*.

The continuous "creeping" prevents injury to the tires and keeps them clean, minimizing the chances of punctures.

The secret process of hardening the cross chains, just adopted, gives extreme lasting qualities.

Easily carried, as the small bundles they make in their canvas bags take so little room that they could be carried in your pocket, when not in use, without inconvenience.

Order them from your dealer or write us direct for full particulars.

Weed Chain Tire Grip Company, 28 Moore Street, New York

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and gives maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen $\frac{1}{4}$ -inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

PREST-O-LITE

"The Light Universal"

Ask Any Experienced Motorcyclist

He will tell you the advantages of Prest-O-Lite on your machine.

One accident on the road at night, due to poor light, costs many times the price of Prest-O-Lite.

If you are going to ride after dark, don't trust to the poor, unsatisfactory, unreliable light of a generator.

Don't get any "imitation" lighting system that is not backed by complete service.

Don't experiment. Don't take chances. Profit by the experience of thousands and get Prest-O-Lite—
When you buy your machine

Insist Upon Prest-O-Lite!

It is the ONLY gas tank that is backed by universal service

If you are a "stay-at-home," the chances are you don't need any light on your machine.

But if you are going out on the open road—if you are really to realize the joys of your motorcycle—you must have service.

You will find Prest-O-Lite Exchange Stations in practically every city, town and village in the

country. 15,000 agencies that guarantee you service no matter where you go.

And one point more—the best time to get Prest-O-Lite is when you buy your machine.

Ask the dealer how much it will cost you to have Prest-O-Lite put on.

If you want any further information about Prest-O-Lite we will gladly send you our Motorcyclist's Booklet, showing how the small tank is easily attached to any machine. Ask for it today.

Price of Tank \$10

EQUIPPED WITH GAUGE

Dimensions: Length, 18 1/4 inches; diameter, 4 inches; weight, 3 1/2 pounds.

Our Handy Rule and Gasoline Gauge sent on request. Measures gasoline in tank; flexible for measuring tires, etc.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per

day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4.....\$5.50	28 x 2 1/4.....\$6.50	28 x 3.....7.25
26 x 2 1/2.....6.00	28 x 2 1/2.....6.75	29 x 3.....7.50
	28 x 2 3/4.....7.00	

Other sizes on application.

Ask Your Dealer for "Bricton" Detachable Treads

Ask the best dealer in your town to show you the famous "BRICTSON" Guaranteed Detachable Tread. If for any reason he cannot supply you, fill out the attached ORDER BLANK, pin your check to same, mail it, and I will ship you the treads on TEN DAYS' FREE TRIAL, and if you don't find them perfectly satisfactory within 10 days from receipt of treads, return them and I will cheerfully refund your money. Remember, I take all the risk.

POPE MOTORCYCLE

Model H, with Imported Magneto, \$165

Simple to
Operate

Comfortable
to Ride

Easy to
Handle

Economical
to Run

The Pope Motorcycle is rapidly forging ahead. Its popularity is advancing by leaps and bounds. There are a large number in use, and all are giving their owners satisfactory service. The Pope Motorcycle has filled a long-felt want and created a distinct field for itself among the great mass of riders. The secret of its success is Quality and Value. It was the first popular-priced machine to make good on the road.

For Touring and all-round use the Pope Motor-

cycle has no superior. It is comfortable to ride, simple to operate, easy to handle and economical to run. The Pope has plenty of power to climb the steepest hills and negotiate the sandiest roads.

The engine starts easily and is remarkably flexible. You can throttle it down so that the machine moves very slowly. Owing to its light weight, a Pope Motorcycle can be managed without taxing a man's strength. It is in a class by itself as regards quality and price.

ALL POPE DEALERS SHOULD CARRY POPE MOTORCYCLE CYLINDER OIL

Refined especially for lubrication of Pope machines
Attractively put up in fancy cans

The best results are always obtained by selecting an oil adapted to the particular motor in which it is to be used. This oil has been selected after exhaustive tests and has been found to meet the requirements of the Pope Motorcycle. Its exclusive use is strongly recommended.

1-Gal. cans for rider's use.

5-Gal. cans for shop use.

Style, Neatness and Individuality—
these are the three important characteristics of
AURORA BRAND MOTORCYCLE CLOTHING.
You owe it to yourself and to the great class of riders you
represent, to look your best on a motorcycle. **AURORA**
BRAND Clothing is cool, light in weight, rain, dust and wind-
proof, perfect fitting and complete in workmanship. That's why

AURORA

BRAND

Motorcycle Clothing

is enthusiastically endorsed by clubs and individual riders
throughout the country.

MOTORCYCLE CLOTHING FOR LADIES

For tandem riding, we wish to call attention
to the skirt illustrated here. Not only is it
the ideal tandem skirt, but it can also be used
as a walking skirt. The two divisions of the
skirt are formed in front by a button panel,
thus making it an ordinary walking skirt. For
tandem riding, front panel is unbuttoned on
left side, folded and buttoned down right
side or removed, as desired.

**We also make Motorcycle
and Automobile
Dusters**

New Era Wins Again

ANYWHERE UNDER ANY CONDITION

This Is The Machine That Always Wins

In the 24-Hour Endurance Run held by The North Shore Motorcycle Club, from Chicago to Milwaukee and return twice, the NEW ERA again proved its great endurance and speed by finishing with a higher percentage than any other make of machine entered—there was only one NEW ERA entered, and that one finished 1000% perfect. Everyone concedes this run to have been the most gruelling run held in the Central District this season. Just keep your eyes on the NEW ERA and watch it repeat.

Make a "Has-Been" Of Old Man Loneliness

Get a **Majestic Side-Car** and we guarantee you'll eliminate the word "lonely" from your vocabulary. It will boost your popularity a hundred per cent. with the fair sex.

How many times on your encountering some particularly delightful piece of scenery, have you wished that you had "someone" along to enjoy it with you?

And haven't you felt kind of small and mean when you took out your "boat" for a delightful spin over rolling hills in the bright sunshine and thought of "her" sitting home and waiting for you to come back and tell her what a delightful time you had!

Why not take her with you? Tandem? A tandem is all right, but special clothing is needed and it isn't half as comfortable as a side-car.

How's this for a Sunday morning programme? 8:30, Hitch up the Side-Car—It takes two minutes;—8:35, "What!—we won't be able to eat all that lunch?" Well, we'll give what's left to the Birds and the Squirrels. Ready? Well, we're off! Off for the Hills and Pastures new in the far-a-way.

IS THIS THE GAME FOR YOU OR ONLY FOR THE OTHER FELLOW?

Specifications

Wheel	26 or 28" as desired.
Tire	First quality Kokomo.
Hub	Turned from bar-steel, small auto-size.
Bearings	Heavy adjustable ball.
Springs	Double leaf, "C" design with clips. No holes in same.
Chassis	Seamless steel tubing, pinned and brazed throughout.
Fittings	Two sets with each Majestic Side-Car, one permanent and one quick detachable.
Fender	Embossed steel, 6½" wide, enamelled, heavily braced.
Body	Large and generous. Plenty of leg room. Made of Genuine Asiatic Reed.

ON TO COLUMBUS!

Another Big Manufacturer Equips With United States Tires

The Miami Cycle & Mfg. Company has signed a contract that provides for United States Tire equipment on a large proportion of next year's output of Merkel machines.

These big motorcycle makers, such as the Miami Cycle Co. and the others we have mentioned in previous issues, have chosen United States Tires because of two things.

1st: They have had it demonstrated that there is a demand on the part of riders everywhere for United States Tires, and that in supplying these tires as equipment they add a valuable selling point to their machines.

2nd: They have proven to their own satisfaction that the extra strength and durability which has come from uniting into one tire all the strong points of two famous makes, actually adds strength and durability to their machines.

Riders, you will do well to follow the lead of these prominent makers in making your own tire selection.

Special Notice to Merkel Agents

You can now have your machines equipped with America's **Predominant Tires**. Write the Merkel factory specifying United States Tires and also specify them on your orders.

CIRCULATION THIS ISSUE, 15,000 COPIES.

THREE DOCTOR-CANDIDATES FOR THE F. A. M. PRESIDENCY

Dr. J. P. Thornley, of New York.

Dr. B. J. Patterson, Rexford, Kan.

Dr. Clinton La Salle, Rochester, N. Y.

UNLESS all signs fail, the next president of the F. A. M. will be a Doctor, hailing from either New York State or Kansas. There are at this writing three presidential possibilities, and the name of each carries a titular prefix, viz. Dr. J. P. Thornley, of New York City; Dr. B. J. Patterson, of Rexford, Kansas, and Dr. Clinton La Salle, of Rochester, N. Y. The former is chairman of the Committee on Competition, and the latter two are district vice-presidents of the F. A. M. One of the three will undoubtedly succeed President Hamilton, who will not be a candidate for re-election.

The choice of a president by the delegates to the National Assembly in Columbus next week will intimately involve the appointment of the next

chairman of the Competition Committee. Dr. Thornley has made it plain that he does not want the presidency, and he is a candidate simply to insure re-appointment to his present office. It is safe to say that a majority of the Columbus delegates will be in favor of Thornley's being retained in his present position. When that question has been determined to the satisfaction of Thornley's supporters, the contest for the presidency will in all likelihood simmer down to Patterson and La Salle, both of whom confidently hope to be elected. To attempt to predict which of the two will be successful would be the wildest sort of guesswork, as it is impossible not only to learn the sentiment of the delegates, but even to know how many delegates

will be present, or what States outside of Ohio will be best represented in the convention.

There is no opposition to Secretary-Treasurer Gibson, and he will be elected by acclamation.

In addition to selecting a president, secretary-treasurer and two directors, the assembly will vote upon important amendments to the Constitution and By-Laws and the long-delayed revision of the Rules for Competition. Among the Constitutional amendments is a proposal to abolish the F. A. M. districts and vice-presidencies. Numerous changes are proposed in the Competition Rules, notably a radical one in the present classification of competitors. The sessions promise to be both busy and interesting.

HOW BRITISH RIDERS ARE ORGANIZED

NOW that F. A. M. membership gains are exceeding all past figures and extensions are being contemplated in the system by which the national body seeks to advance the interests of its riders, a consideration of the scope and working methods of the organizations under which English motorcyclists are protected is timely and not without instructive value. Riders in the United Kingdom are listed with either the Auto Cycle Union or the Automobile Association and Motor Union. The first named is the governing motorcycle body. In the latter the members are enabled to reap some of the benefits accruing to automobilists as well as

those interded exclusively for owners of the single-trackers. Primarily the A. A. & M. U. is an automobile body, arrangements having been made only a few months back to include motorcyclists.

The Auto Cycle Union.

The Auto Cycle Union, which has been of vast assistance in the upbuilding of the motorcycle field in the United Kingdom, operates on a broad scale and aims to protect the individual as well as the future of the sport. To begin with, members are supplied with a handbook which gives valuable details relative to Continental traveling and license regulations, and further information may be obtained at any time on application to the A. C. U. headquarters. Under all reasonable conditions legal service is free to members of the body. The governing body not only furnishes referees for sanc-

tioned events, but provides a full set of officials if they are desired. It makes arrangements for triptyques, to be used by riders touring on the Continent, and is of great assistance in obviating unpleasant tangles of red tape at ports and the frontiers of Continental countries. In other words, it strives to keep in touch with its members at all times and to relieve them of every possible discomfort.

Members of the A. C. U. are supplied with identification plates by which their machines may be traced if they are lost in transit or stolen, and the system of locating motorcycles under such conditions has been developed to a highly satisfactory degree. Not long ago the Auto Cycle Union interested itself in a movement to prevent the publication of misleading motorcycle advertisements, and in this way an undesirable trade element was removed. It has co-operated with the Cycle Traders' Union along other lines, and appears to be ever on the alert for an opportunity to assist manufacturers as well as dealers and riders in general.

Scope of the A. A. & M. U.

While the Automobile Association and

G. H. Hamilton, President of the F. A. M.

Motor Union is of much more recent interest as far as motorcyclists are concerned, it holds out a number of inducements not as yet offered by the older body, and as a result about 10,000 of its 45,000 members are riders of the power two-wheeler. One of the most important features is the patrol organization which was taken up when the Automobile Association was formed over five years ago. The system was at first confined to the Brighton Road, but it has since been developed until it covers thousands of miles of main highway, including roads in Scotland. The patrolmen are experienced riders, mounted on motorcycles and bicycles, and it is their duty to cover given routes in order to render practical assistance when an automobilist or motorcyclist gets into difficulty. Not only are the patrol riders called upon to give all kinds of touring information, but they must be capable mechanics and experts in first aid and surgical treatment. If an automobilist or motorcyclist runs short of gasoline at an isolated point, for instance, he has only to wait until a patrol rider appears, when this officer will at once proceed to the nearest supply station and return with the precious fuel. If a tire is blown out or mechanical trouble is encountered the patrolman is obliged to shed his jacket and assist with the repairs. In the event of an accident a road patrolman gives first aid treatment and then superintends the removal of the injured rider to a hospital or other point of safety. In short, a member of the A. A. & M. U. is in a position to call upon the patrols for any reasonable service.

Free Legal Service.

All motorcycle members of the A. A. & M. U. are entitled to the services of the organization's attorneys for alleged offenses under the Motor Car Act, the following violations being among those covered: Driving "to the public danger," failure to produce driving license, driving at night without identification numbers properly illuminated, exceeding the speed limit and failure to comply with technical regulations as to registration, etc. The attorneys representing the organization are selected for their knowledge of the motor laws. In addition to cases coming under the Motor Car Act the attorneys are authorized to serve members in civil actions concerning their motorcycles, up to the point where proceedings are actually instituted. This applies to such matters as third party

claims which are not covered by insurance, disputes in regard to repairs or purchases, etc.

The A. A. also offers an insurance policy which embodies a unique clause. For a comparatively light charge the motorcyclist is insured in such a way that he may apply to the A. A. executive committee for a final settlement of his claims in the event of a dispute with the underwriters. This guarantees satisfaction for the rider, as the A. A. is obligated to stand with him until his case is settled.

Extensive Hotel System.

The A. A. & M. U. hotel system extends throughout England, Wales and Scotland. The hotels are selected and passed upon by a special committee, and before they are given the stamp of approval it is understood between the proprietors and the organization officials that A. A. & M. U. members are to receive special consideration. In the entrance hall of each approved hotel is a bulletin board in the center of which is a locked cabinet containing road information, supplied by members, agents, hotel proprietors and patrols, to each of whom a key is given. The bulletin board is thus made a practical means of communicating road information to members, and it may also be utilized for messages. A party riding out early in the day, for instance, may leave a note at a specified bulletin cabinet so that friends who follow later may be instructed as to a meeting place and given other personal directions. The value of this system is obvious, and it has proved one of the most attractive features of the organization's work.

E. M. ESTABROOK,
Chairman F. A. M. Membership Committee.

Registered Agents.

A. A. & M. U. agents are supplied with signs and credentials similar to those provided by the F. A. M. in this country, but the service

system is carried into more detail on the other side. In addition to giving members of the organization special attention, each agent has his establishment in direct touch with a central department so that help may be summoned promptly in case of an accident or when repairs are needed for which the agent in question has no facilities. Members who tour abroad with their motorcycles can obtain from the association a customs card which obviates the necessity for depositing duty at the various frontiers. In addition to this the A. A. hotel system has been extended to

HOWARD FRENCH,
F. A. M. Director.

France, and it will be carried into other continental countries, to provide for the A. A. tourist after he has left home soil. The association has also been authorized to issue international driving permits and car permits to avoid the necessity for obtaining foreign licenses.

How Funds Are Spent.

The handbook issued annually to A. A. & M. U. riders contains full information concerning the location of patrols, a list of agents with particulars as to their repairing facilities, etc., a list of officially appointed hotels, foreign touring information and routes and a legal section devoted to a summary of the law as affecting motorists.

The funds received by the A. A. & M. U. through the subscriptions of members go to defray the cost of erecting sign posts and

F. I. WILLIS,
F. A. M. Director.

warning boards, improving dangerous corners and roads in general. The money is also expended in contests to prevent the passage of unreasonable local speed regulations, to safeguard the interests of motorists in Parliament to discourage dangerous driving by both automobilists and motorcyclists, to agitate for better lighting of all vehicles on public roads and to work for proper limitation of taxation on motor vehicles throughout the United Kingdom.

ON THE AFFILIATED LIST.

THE following clubs have recently joined the Federation ranks: Covington (Ohio) Motorcycle Club, G. E. Drees, secretary, 15 members, 100 per cent.; Emporia (Kansas) Motorcycle Club, D. R. Kerr, secretary, 709 Commercial street, 15 members; Yale Motorcycle Club, Toledo (Ohio), I. W. Schroeder, secretary, 246 Wasaon street, 25 members; Pottstown (Pa.) Motorcycle Club, G. E. Freshley, secretary, 119 High street, 17 members; Smith County Motorcycle Club, Smith Center (Kansas), Seth Myers, secretary, 14 members; La Crosse (Wis.) Motorcycle Club, Ted Schultz, secretary, 1325 Jackson street, 20 members, 100 per cent.

CLUB ORGANIZERS.

AMONG those starting new clubs this week are: H. F. Farnsworth, 500 Prindle street, Chehalis, Wash.; W. H. Powell, Sodus, N. Y.; F. M. Turner, Union City, Ind., and J. M. Chapman, Charlotte, N. C.

OUT of sixteen clubs affiliating with the Federation in the month of June, fourteen were 100 per cent. squads.

F.A.M. ORGANIZATION POINTERS

GOVERNMENT OF THREE SIMILAR ORGANIZATIONS

THE Automobile Club of America has a limited membership and is regulated by a Board of Governors as mentioned below. Its objects are: to promote a social organization or club, composed in whole or part of owners of self-propelled pleasure vehicles; to afford a means of recording the experiences of members and others using automobiles and to promote original investigation in the develop-

Secretary-Treasurer Gibson.

ment of automobiles, etc. The organization co-operates in securing rational motor vehicle legislation, and protects the interests of owners and users against unjust or unreasonable legislation and maintains the lawful rights and privileges of owners and users of all forms of self-propelled vehicles, whenever and wherever such are menaced. A prime object is in the encouragement and development of the automobile and like means of propulsion (fly-

ing machines, motor boats, etc.) and mechanisms incidental to the same. The promotion and encouragement of road construction and maintenance, as well as the improvement of existing highways is also provided for.

The officials consist of a president, three vice-presidents, a secretary and a treasurer. The Board of Governors has 12 members, of which the president and vice-presidents with the treasurer are members. For their assistance the following committees are formed: Executive, Auditing, Legal, Bureau of Tours, Highways, Technical, with others incidental to the maintenance of a club only. The Executive Committee (president, first vice-president and three other board members) acts for the club in all matters affecting its interests, instructs and authorizes any officials or members or any committees appointed by it to represent it and to carry out its policies. It makes rules for the government of the club, elects officials and fills vacancies on the Board of Governors. It fixes or remits penalties, and enforces any penalties inflicted. Its further duties are such as would be fulfilled by a board of directors of a corporation or like body.

The Auditing Committee performs general auditing of the club's accounts, including those of the other committees. The Bureau of Tours has maps prepared, provides for the acquiring of American and foreign touring information and the distribution thereof to members; erects sign-posts, etc. The Legal Committee attends to all legislative matters as are mentioned above. The Technical Committee encourages the development of automobiles, engines and allied mechanisms as stated above, and having a laboratory embodying a testing apparatus, is a potent factor in this direction. Representatives can be furnished from this committee for the settlement of disputed questions on economy contests and tests of horsepower, speed, etc. New ideas are encouraged, if of worth, and this branch has proved itself most valuable to the development of the industry since the formation of the club. The committee is an acknowledged authority on such matters, and is appealed to frequently.

The questions pertaining to highways are taken care of by the highways officials. From the other committees, officials for contests of various natures have been assigned in the past. The Board of Governors has a representative in each committee; thus the third vice-president is a member of the Bureau of Tours, etc. These board members are generally the chairmen of their respective com-

J. W. THOMPSON,
Vice-president Southern District.

mittees. The Bureau of Tours has membership outside of the regular club membership and additional thereto, but is under the club's control as stated.

American Automobile Association.

The American Automobile Association is formed of a number of State associations under the governance of a national body, and

has a representative form of government. The association proper has a national headquarters at which are located the officers of the various boards and committees. In addition to the State associations, clubs can affiliate with the association and have representation as mentioned below. The objects of the association are to secure rational legislation for automobiles, to form proper rules governing their use, to protect the interests of users against unjust discrimination and maintain their lawful rights and privileges, to encourage the use and development of the automobile and to promote the "Good Roads" movement. To this end a board of directors is the governing body, with the following boards and committees: Executive, Good Roads Board, Touring Board, Legislative Board and Contest Board.

The Board of Directors is made up of representatives from the State associations and affiliated clubs, one to each club or association. From the board are appointed the chairmen and members of the boards or committees and the officials, which are: President, three vice-presidents, chairman executive committee, treasurer and secretary. As in the Automobile Club of America, the president

J. B. COBLENS,
Vice-president Gulf District.

and vice-presidents are often chairmen of various boards. All officials, however, are elected annually, and are not necessarily more than members of the various boards. The Executive Committee has the same powers as that of the same committee of the A. C. A. The same is true of the Board of Directors as compared with the Board of Governors.

The Good Roads Board promotes the "Good Roads" movement, in the encouragement of road construction and maintenance and in the improvement of existing roads. As each State association and affiliated club is modeled upon the lines of the parent body, each will have (local) officials, heads of boards, etc., consequently the Good Roads Board consists of representatives of the local Good Roads Board, one from each State association and affiliated club. The Touring Board has its association chairman, and is made up of representatives of local touring boards. It has general charge of all tours conducted by the

EARLE L. OVINGTON,
Director of the F. A. M.

association, of the gathering and collecting of touring information, etc. The national board receives reports from the local boards and issues sanctions for contests. There is one member from each club or State association on the national Touring Board. The association has European representatives who are members of this Touring Board and under the governance thereof.

B. A. SWENSON,
F. A. M. Commissioner for Providence.

The Legislative Board corresponds to the Legal Committee of the A. C. A. It is made up of State Association and affiliated club representatives as on other boards, with an official as chairman. The Contest Board is appointed in its officials by the Board of Directors and has associate members, usually one from each State. It consists of a chairman and four board members; and advisory committee and a technical committee. The technical committee has functions somewhat similar to the corresponding body in the A. C. A. The Contest Board issues sanctions, the chairman doing this in person after consideration by the members. The duties of the advisory committee members are various: such as with regard to legalities of meets, races, contests, etc. Officials for such events are furnished (referees, judges, etc.), and a member of the board is supposed to be present at all meets, etc., held under the association's sanctions.

C. H. LANG,
F. A. M. Commissioner for Illinois.

League of American Wheelmen.

Upon the skeleton of this body, modern motor organization regulations have been based. The league, better known as the L. A. W. was "an association established to promote and facilitate the sport of bicycling, to protect members in their rights and to secure better laws for the construction of highways." The officers were: president, vice-president, secretary-treasurer, one chief consul from each State, and one representative per State for every 50 members therein. These formed a board of officers, of which eight formed a quorum. Each State in which there were 25 members or over formed a State division, the code of by-laws being in keeping with the constitution of the L. A. W. An executive board, consisting of the chief consuls and representative and the secretary treasurer, was in command. Only amateurs were eligible to membership.

HOW F. A. M. BOOSTERS EARNED REWARDS

Every Member Who Brought in Five Recruits Will Receive a Federation Emblem From Secretary Gibson—

F. J. Herman, of Pueblo, Heads List With Seventy-Four New Applications.

THAT F. A. M. members, as individuals, have been working consistently for the upbuilding of their organization during the last year is indicated by the list printed

G. EUGENE LAIN,
F. A. M. Commissioner for New Mexico.

below of those who have brought at least five recruits under the banner. Early in the fiscal year which has just closed Secretary Gibson announced that each Federation worker who turned in the membership applications of five riders would be entitled to an F. A. M. novelty, and accordingly only those who qualified for rewards are included in the list which follows:

Outside the States.

Alan L. C. Ross, Vancouver, B. C., 26; Theodore Siddall, Manila, P. I., 16; T. H. Smallwood, Culebra, Canal Zone, Panama, 5.

Massachusetts.

Kenard C. Bryan, Lynn, 5; A. B. Maddison, Lynn, 7; C. I. Page, Greenfield, 7; W. E. Wiswell, Lynn, 8; Earl Gove, Brockton, 12; A. C. V. Kennedy, Boston, 14; James Dunham, Middleboro, 16; W. F. (Continued on page 66.)

OHIO SETS PACE IN F. A. M. MEMBERSHIP

Buckeye State Has Nearly 1,500 Federation Riders, with New York, Illinois and California Trailing Closely—
Last Number Issued by Secretary Gibson in June Was 16,250.

HAVING 1,459 members in good standing on July 1, Ohio leads all other States in F. A. M. representation, according to a complete schedule of State memberships just prepared by National Secretary Gibson. New York is in second place with 1,356 members, Illinois has 1,138 Federation riders and California has a squad of 1,023 affiliated riders. Below the thousand mark Pennsylvania ranks highest, with 826 members; Indiana has 735 and Massachusetts 518. Secretary Gibson's full list, divided as to club and unattached riders, is as follows:

Maine—affiliated, 1; unaffiliated, 5; total, 6. New Hampshire—affiliated, 14; unaffiliated, 18; total, 32. Vermont—unaffiliated, 1. Massachusetts—affiliated, 358; unaffiliated, 160; total, 518. Rhode Island—affiliated, 106; unaffiliated, 12; total, 118. Connecticut—affiliated, 88; unaffiliated, 73; total, 161. New York—affiliated, 963; unaffiliated, 393; total, 1,356. New Jersey—affiliated, 333; unaffiliated, 79; total, 412. Pennsylvania—affiliated, 526; unaffiliated, 300; total, 826. Maryland—affiliated, 155; unaffiliated, 21; total, 176. Virginia—affiliated, 47; unaffiliated, 9; total, 56. West Virginia—affiliated, 39; unaffiliated, 15; total, 54. Delaware—unaffiliated, 3. District of Columbia—affiliated, 83; unaffiliated, 11; total, 94. Ohio—affiliated, 1,151; unaffiliated, 308; total, 1,459. Indiana—affiliated, 548; unaffiliated, 187; total, 735. Illinois—affiliated, 848; unaffiliated, 290; total, 1,138. Missouri—affiliated, 161; unaffiliated, 31; total, 192. Wisconsin—affiliated, 190; unaffiliated, 113; total, 303. Michigan—affiliated, 178; unaffiliated, 61; total, 239. North Carolina—unaffiliated, 9. South Carolina—affiliated, 17; unaffiliated, 19; total, 36. Tennessee—affiliated, 38; unaffiliated, 19; total, 57. Georgia—affiliated, 138; unaffiliated, 25; total, 136. Florida—affiliated, 162; unaffiliated, 41; total, 203. Alabama—affiliated, 62; unaffiliated, 21; total, 83. Arkansas—affiliated, 16; unaffiliated, 9; total, 25. Louisiana—affiliated, 43; unaffiliated, 3; total, 46. Texas—affiliated, 213; unaffiliated, 15; total, 228. Kentucky—affiliated, 32; unaffiliated, 21; total, 53. Mississippi—affiliated, 2; unaffiliated, 7; total, 9. Oklahoma—affiliated, 28; unaffiliated, 9; total, 37. California—affiliated, 874; unaffiliated, 149; total, 1,023. Nevada—affiliated, 1; unaffiliated, 1. Utah—affiliated, 1; unaffiliated, 25; total, 26. Colorado—affiliated, 265; unaffiliated, 40; total, 305. New Mexico—unaffiliated, 9. Arizona—affiliated, 14; unaffiliated, 10; total, 24. Minnesota—affiliated, 105; unaffiliated, 34; total, 139. North Dakota—unaffiliated, 7. South Dakota—affiliated, 11; unaffiliated, 28; total, 39. Nebraska—affiliated, 100; unaffiliated, 18; to-

tal, 118. Kansas—affiliated, 361; unaffiliated, 28; total, 389. Iowa—affiliated, 189; unaffiliated, 58; total, 247. Wyoming—affiliated, 3; unaffiliated, 6. Montana—affiliated, 38; unaffiliated, 18; total, 50. Idaho—affiliated, 27. Oregon—affiliated, 78; unaffiliated, 15; total, 93. Washington—affiliated, 267; unaffiliated, 27; total, 294. Philippine Islands—affiliated, 16; unaffiliated, 2; total, 18. Panama—affiliated, 17; unaffiliated, 3; total, 20. Canada—affiliated, 61; unaffiliated, 11; total, 72. Mexico—unaffiliated, 1. England—unaffiliated, 1.

F. A. M. GROWTH IN JUNE.

F. A. M. statistics for June are as follows: New members by districts—New England, affiliated, 12; unaffiliated, 16; renewals, 12; Atlantic, affiliated, 121; unaffiliated, 23; renewals, 85; Peninsular, affiliated, 61; unaffiliated, 6; renewals, 5; Lake, affiliated, 319; unaffiliated, 94; renewals, 165; Gulf, affiliated, 23; unaffiliated, 3; renewals, 5; Central, affiliated, 54; unaffiliated, 13; renewals, 23; South Western, affiliated, 54; unaffiliated, 20; renewals, 42; Pacific, affiliated, 38; unaffiliated, 1; renewals, 3; Canada, unaffiliated, 1; total of new members, 899.

The new members for June by States are: New Hampshire, 4; Massachusetts, 19; Rhode Island, 5; New York, 49; New Jersey, 18; Pennsylvania, 80; Maryland, 14; District of Columbia, 13; West Virginia, 9; Virginia, 1; North Carolina, 1; South Carolina, 22; Georgia, 4; Florida, 3; Alabama, 35; Tennessee, 2; Texas, 23; Kentucky, 1; Louisiana, 1; Arkansas, 1; Ohio, 148; Indiana, 66; Illinois, 124; Michigan, 16; Wisconsin, 48; Missouri, 11; South Dakota, 2; North Dakota, 1; Kansas, 56; Iowa, 8; Nebraska, 2; Minnesota, 8; California, 65; Colorado, 3; New Mexico, 4; Arizona, 2; Washington, 26; Oregon, 7; Montana, 6; Canada, 1.

NEW IN THE RANKS.

IN considering the full line-up of Federation clubs do not overlook these, fresh from the hands of their organizers: Santa Rosa (Cal.) M. C., H. C. Bremer, secretary, twenty-two members; Carbondale (Pa.) M. C., R. G. Moon, secretary, fifteen members; Coffeyville (Kan.) M. C., Fred Scothorn, secretary, eighteen members; Goshen (Ind.) M. C., W. R. Weber, secretary, eighteen members; Blair County M. C., Altoona, Pa., T. M. Sheedy, secretary, twelve members. Each of these clubs brought in its members on a 100 per cent. basis.

F. A. O. Johnston, president of the Toronto M. C., is also chairman of its contest board.

JESSE CAMPBELL,
Formerly Ohio State Commissioner and Now
Lake District Vice-President.

ANOTHER \$25 CHECK.

THE N. B. HARRIS Detective Agency, in Los Angeles, Cal., has just received a \$25 check from Secretary Gibson, in keeping with the provision which sets aside a reward of this amount for the recovery of a motorcycle stolen from a Federation member. On December 31 a machine belonging to Paul J. C. Derkum was stolen in Los Angeles and the case was placed in the hands of the detective agency. In February two arrests were made and the motorcycle was recovered.

A ROAD PRECEDENT.

ELWOOD, Ind.—Walter Evans, an Elwood motorcyclist, was fined \$10 and costs by a Fairmount justice of the peace, for failure to give half the road to a farmer whom he met on the Fairmount-Alexandria pike. Evans was on his way to the Fairmount race tracks and was carrying Duke Humphries, another Elwood boy, on his handlebars. When he met the farmer, he found it difficult to turn out of the beaten path, and accordingly forced the rig out of path, and the horse turned around so quickly that the buggy was overturned. Evans and Humphries stopped and gave all the assistance possible.

LAMP WINNERS FOR JUNE.

IN the club contest for Old Sol lamps donated by the Hawthorne Mfg. Co., the winners for June are as follows: Indian Motorcycle Club, Mobile, Ala.; 28 members, two lamps; East Side Motorcycle Club, East St. Louis, Ill.; 28 members, two lamps; Austin Motorcycle Club, Chicago, Ill.; 24 members, one lamp; West Texas Motorcycle Club, Stamford, Texas; 23 members, one lamp.

TWO CLUB PRIZES.

THE members of the West Texas M. C. made a big push to get among the winners of Old Sol lamps for June and rather than deny them the fruits of their effort, Chairman Estabrook has decided to add two more lamps to the winnings for that month, thus satisfying the two clubs tied for first place.

WHAT with the four lamps given to clubs taking part in the National Tours and with three lamps given to clubs in the Short Grass Tour and the fourteen lamps awarded as above, the F. A. M. is certainly showing a disposition to help those who help themselves.

REGISTERED SHOPS.

THE following repairers have taken out certificates of registration with the F. A. M.: Kumler Bros., 1769 East Fifty-fifth street, Cleveland, Ohio; Arnold Motor Co., 211 Sixth street, Logansport, Ind.; Coffeyville Machine & Motorcycle Repair Co., 216 East Tenth street, Coffeyville, Kan.; N. P. Rosvall, Esbon, Kan. Information relative to registration of repair shops with the F. A. M. will be sent upon request. Inquiries should be addressed to E. M. Estabrook, Bangor, Me.

A CORRECTION.

IN an outline of a proposed amendment to Article 5, Section 4 of the F. A. M. constitution, referring to the election of the president and the secretary-treasurer, it was inadvertently stated in the June 27 issue of *MOTORCYCLE ILLUSTRATED* that the revision would provide for the election of these officials by a "majority vote of the total number of directors present." It was the intention to refer to the vote of the *delegates* present, not the directors.

COLUMBUS TOURISTS.

J. E. JACKSON, of Tampa, Fla., left there on July 4 for Columbus on his Yale, and will call for his F. A. M. card, pin, etc. when he reaches Atlanta, Ga.

READY FOR THE GUN

National Tourists Are at the Tape Prepared for the Movement to Convention City.

WITH the end of this week comes the beginning of the 1912 F. A. M. tours and the meet at Columbus. Albany, N. Y., sends the first of the two-wheelers into the field, the Albany tour starting Sunday morning with F. S. Ellett, of Elmira, as tourmaster. It is believed that at least 800 riders will be in line when the four tours join in Columbus next Wednesday morning. The tours have been thoroughly advertised, and the entries have been large. Last Saturday Tourmaster Baker, of the Louisville, or Southwestern Tour, had thirty-five entries. Tourmaster Campbell had forty-two, and Ellett, of Elmira, had about thirty. During the present week each tourmaster has received additional entries.

The gold and blue sweaters and caps, provided for the tourmasters, have been forwarded to them, and the caps for the lieutenants have been sent to the four road officials for distribution. The arm-bands which are to be given to each rider are ready, and the gold medals, to be awarded to each tourist who completes his tour, will be ready for distribution at Columbus. They are heavily plated, bearing a bas-relief of a motorcycle and a blue enamel plate on the face. In the enamel are the words "F. A. M. Tours," surrounding a miniature motor. On the reverse of the medal is the inscription "Awarded by the Federation of American Motorcyclists, 1912 National Tours, Columbus, O., July 17-21."

Samples of the medals were received last week by Fred I. Willis, of the F. A. M. press committee, and Guernsey Van Riper, tour secretary. They were approved by President Hamilton, who was in Indianapolis, where he met with Chairman Willis and Secretary Van Riper to discuss the final details of the tours.

"The 1912 tours have been thoroughly advertised," said President Hamilton, "and every F. A. M. member has been personally urged to join the tours and attend the Columbus meet. We have every reason to believe that the attendance at Columbus will break all records, and that the tours will attract more riders than ever before in our history.

"I hope each tourmaster will enforce all

the rules rigidly—and I am sure they will. We want the tours to be pleasure rides—not a hardship. The schedules are easy, and if they are lived up to each rider should come into Columbus as fresh and full of vim as when he started. I urge every rider to observe carefully the rule which prohibits the use of the open muffler in all towns and cities, and I hope each rider will pay particular attention to his personal appearance, as well as the appearance of his machine. A stop should be made just before entering towns of considerable size, and every rider should spruce up. The people in the cities and towns know the riders are coming, and it is the duty of all riders to make the best possible impression. This I am confident they will do."

A change was necessary in the Baltimore tour, and the route was thrown through Pittsburgh, with the first night stop at Bedford Springs instead of Cumberland. The second night will be spent at Pittsburgh, instead of at Wheeling. The Albany tour is also changed slightly. Instead of running from Cleveland to Newark, as had been announced, the riders will go through Akron and Canton to Zanesville, where they will spend the night of Tuesday, July 16. The Baltimore tour division will also be there on that night. Instead of running straight into Springfield from Vandalia, the Chicago tourists will run from Vandalia through Dayton, to Springfield. This change is of minor importance, and is made as a compliment to Tourmaster Campbell, of the Chicago run, whose home is in Dayton.

TO ENTERTAIN TOURISTS.

SALES MANAGER W. P. SURRE, of the Continental Rubber Works, announces that when the riders in the North-eastern tour reach Erie, Pa., on their way to Columbus at noon on July 15 they will be entertained at the expense of the Continental folks. Luncheon will be served and the gasoline and oil tanks of all the machines will be filled under the direction of the Continental staff, so that the tourists will enter upon the next leg of their trip with a well-defined idea of the brand of hospitality that is dispensed at the big Erie factory. "We hope the touring squad will be a large one," writes Mr. Surre, "and no matter how large it is we will be prepared to take care of every rider. Let 'em come along; we're ready."

Part of the Crowd at Opening Meet in Columbus.

Track Officials and Jack Prince.

IMPOSING LIST OF FEDERATION CLUBS

Secretary Gibson's Schedule Shows That Affiliated Squads for June Brought Line-Up Close to Three Hundred Mark—Rapid Progress During Membership Contest.

OF unusual interest to students of F. A. M. affairs is the complete list of Federation clubs printed herewith. The schedule has been prepared by National Secretary Gibson at a heavy outlay of time and energy and is important in that it tells in cold, hard figures just how the national body has progressed. The clubs numbered to 228 were affiliated prior to March 1 of the current year, and the members referred to in each case have been taken in since the affiliations. The others were brought into the ranks during the four-month term of the membership contest which closed June 30. Thirteen clubs were affiliated during March; eighteen were listed in April, seventeen during May and fifteen in June. It will be noted that the last club to affiliate in June was No. 291. Secretary Gibson's list is in full as follows:

No. 2, National Capitol, Washington, D. C., 29 members; No. 4, Linden, Brooklyn, N. Y., 5 members; No. 5, Dayton, Dayton, Ohio, 23 members; No. 8, Los Angeles, Los Angeles, Cal., 3 members; No. 9, Rhode Island, Providence, R. I., 7 members; No. 11, Indian, Cincinnati, Ohio, 16 members; No. 12, Detroit, Detroit, Mich., 1 member; No. 13, Queen City, Cincinnati, Ohio, 28 members; No. 21, Columbus, Columbus, Ohio, 18 members; No. 23, Metropolitan, New York City, 2 members; No. 24, Baltimore, Baltimore, Md., 1 member; No. 25, Syracuse, Syracuse, N. Y., 2 members; No. 26, San Francisco, San Francisco, Cal., 2 members; No. 27, Cortland, Cortland, N. Y., 33 members; No. 28, Rochester, Rochester, N. Y., 7 members; No. 29, Springfield, Springfield, Ohio, 2 members; No. 30, Poughkeepsie, Poughkeepsie, N. Y., 6 members; No. 33, Zanesville, Zanesville, Ohio, 10 members; No. 34, North Shore, Chicago, Ill., 16 members; No. 38, Terre Haute, Terre Haute, Ind., 6 members; No. 39, Jacksonville, Jacksonville, Fla., 34 members; No. 42, Waukegan, Waukegan, Ill., 17 members; No. 44, Louisville, Louisville, Ky., 5 members; No. 46, Sun Flower, Beloit, Kan., 1 member; No. 48, Bridgeport, Bridgeport, Conn., 1 member; No. 50, Providence, Providence, R. I., 14 members; No. 51, Seattle, Seattle, Wash., 8 members; No. 52, North Jersey, Paterson, N. J., 4 members; No. 54, New Jersey, Newark, N. J., 10 members; No. 55, Rockford, Rockford, Ill., 18 members; No. 56, Kansas City, Kansas City, Mo., 2 members; No. 57, Peoria, Peoria, Ill., 1 member; No. 60, Crown City, Pasadena, Cal., 1 member; No. 61, Chesters, Mt. Vernon, N. Y., 2 members; No. 62, Elmira, Elmira, N. Y., 18 members; No. 63,

FOR MERKEL RIDERS.

FRANK LIBBEY VALIANT, advertising manager in the home of Flying Merkels, has sent out a breezy circular letter informing Merkel riders throughout the country that special arrangements have been made to accommodate them at the Hotel Southern in Columbus during convention week. The Miami folks are desirous of giving the riders an opportunity to gather under one roof, and to that end they have obtained a special rate of \$1 a day, with bath, at the above-mentioned hotel. A number of Merkel boosters from the factory will be on hand to welcome the boys, and the "get together" party at the Hotel Southern will no doubt be one of the most pleasant features of the big program for riders of the orange mounts.

Advertising Manager Valiant and Mrs. Valiant will make the trip from Middletown to Columbus with a Merkel 6 and side-car. They will join the southwestern touring squad at Indianapolis.

STANDING FOR BOSCH CUP.

AS the time draws near for the F. A. M. championships at Columbus, speedsters who count upon being with the top-notchers are giving much thought to the handsome Bosch trophy, which will go to the champ who earns it on points, and the accompanying illustration proves that the riders are not interested without reason. The cup stands 20 inches high and is of sterling silver. It is valued at \$250. Although two of the championships have already been decided, any rider who makes a consistent fight at the Columbus meet will have an open chance to carry off the trophy, inasmuch as the point system extends the competition fairly throughout all the championship contests. The standing of contenders for the cup at present is as follows: John U. Constant, 12 points; Don Klark, 7 points; Don Johns, 6 points, and Erwin Baker, 5 points.

TWO CHANGES IN ROUTES.

OWING to the fact that a change has been found necessary in the itinerary for the southeastern tour to Columbus, making the first night's stop at Bedford Springs and the second at Pittsburgh, it is announced that a revision will also be made in the route for the northeastern division. Instead of making the run for the fourth day from Cleveland to Newark, 123 miles, the riders in this squad will proceed from Cleveland to Zanesville on this leg. These are the only changes officially announced since the full routes for the four tours were given publicity.

FRENCH IS CARRYING TIRES.

HOWARD A. FRENCH, who is always to the front in motorcycle affairs in Baltimore, Md., is now on his way to Columbus in his Pullman motor car, accompanied by Mrs. French and two friends. One of the latter is a representative of the Baltimore branch of the Goodyear Tire and Rubber Co., and arrangements were made to have a supply of Goodyear tires and tubes in the French car so that riders in the Southeastern tour to the convention city may be assisted along the route.

WOMAN OF SIXTY A RIDER.

DENVER has an unusual motorcycle enthusiast in Mrs. A. E. White, who, though sixty years old, believes in the pleasure and safety of the two-wheeler. She has taken several trips with her son.

George Evans in first try-out on Columbus board track.

JULY 4TH RACING RETURNS

AT ELWOOD, IND.

ELWOOD, Ind.—The motorcycle meet of the Indiana Racing Association, of Indianapolis, at the Elwood Driving Park track, on July 4, was one of the most interesting that has been held in central Indiana. The feature of the meet was the Madison County championship race for a beautiful silver cup. There were but two entries, Schafer, of Indianapolis, riding an Indian, and Eugene Culp, of Elwood, riding a Harley-Davidson. The finish was an exciting one, there being but one-tenth of a second between the machines as they went under the wire, Culp winning by a "nose." There were about three thousand people out to witness the races, and the promoters were so well pleased with the affair that they will hold another event on the Elwood track in the fall.

Elwood has one of the finest tracks in the Middle West for motorcycle racing. It is banked high on the turns, and is kept in excellent condition, owing to its being used the year round for horse training. A band furnished concerts between heats so that the large crowd was well entertained.

Miss Viola Culp, who is touted as the most daring female rider of motorcycles in the Middle West, gave exhibition rides during the afternoon, and made some remarkably fast time, outdistancing her brother who paced her with a twin-cylinder machine. Summaries:

Five-mile event for private owners.—Schafer, first; Culp, second; Richwine, third. Time, 7:05.

Ten miles, open.—Creviston, first; Schafer, second; Myrose, third. Time, 14:12.

Five miles, stripped stock.—Schafer, first; Myrose, second. Richwine was leading on the back stretch in the fourth mile, when his machine skidded, and he was put out of the race. Whipple, who was well up in the bunch, blew a tire and quit. Time, 8:01.

Five miles, open.—Myrose, first; Schafer, second; Miles, Creviston and Richwine in the order named.

Madison County championship.—Culp, first; Schafer, second, the winner making 21 miles in 30 minutes from a standing start. His competitor finished less than ten inches behind.

FREDERICKS BESTS SWARTZ.

DENVER, Col.—Rain interfered seriously with the motorcycle races at Tuileries Park on July 4 and prevented any fast time being made. A fair-sized crowd braved the threatening weather to see the speed events, and rather than disappoint the fans, the racers rode three races on a water-soaked track. The condition of the speedway, added to the fact that the heavy clouds made the day dark, rendered the work extremely perilous.

The match race between Fredericks, mounted on the machine recently ridden by "Red" Armstrong at Cleveland and Chicago, and Ed. Swartz was marked by an exceedingly close finish.

With Boyd out of the game on account of engine trouble and Armstrong's ma-

chine being eliminated, the open events were characterized by hot competition between the Merkel riders for first and second positions. Summaries:

Three-mile match race, professional, 61 class.—M. Fredericks, Excelsior; Ed. Swartz, Indian. Time, 2:15.

Three-mile open, professional, 61 class.—A. Patterson, Merkel; L. Bowen, Merkel; E. Swartz, Indian. Time, 2:14.

Five-mile open, professional, 61 class.—L. Bowen, Merkel; J. Cox, Merkel; Ed. Swartz, Indian. Time, 3:40½.

OUTSIDERS STARRED

Marietta Speed Boys Failed to Figure Among Prize Winners in July Fourth Program.

MARIETTA, Ohio.—Favored with an ideal day for the sport, the Marietta Motorcycle Club held its annual meet on the Washington County fair grounds course on July 4, some thirty speedmen participating. Upwards of two thousand persons witnessed the eight events of the afternoon. A number of cities in this section of Ohio and West Virginia were represented. Every prize fell to outsiders, not a single Marietta rider riding in the money. W. N. Williams, of Zanesville, featured, winning more events than any other rider and making the best time of the day. Two slight accidents occurred. In the fourth race, Gies, of Columbus, went through the fence on the back stretch. He was hurled into the air, alighting on the green nearby with a few slight scratches. His machine was wrecked. Shank, of Huntington, W. V., and Zinn, of Parkersburg, collided in the sixth race, the former being slightly hurt.

The Marietta Motorcycle Club, now in the second year of its existence, has a membership of some twenty-five young men. The club has done a great deal toward furthering interest in motorcycling in this locality. A fall meet will, in all probability, be held either on Labor Day or during the county fair. Summaries of July 4 races:

Two mile novice.—First, Shank, Huntington; second, Zinn, Parkersburg; third, White, Parkersburg. Time, 2:58.

Six mile open.—First, Williams, Zanesville; second, Stathers, Sistersville; third, Zinn, Parkersburg. Time, 8:41.

Four mile stock.—First, Zinn, Parkersburg; second, White, Parkersburg; third, Shank, Huntington.

Pursuit, 10 mile limit.—First, Williams, Zanesville; second, Stathers, Sistersville; third, Zinn, Parkersburg. Time, 10:40. Eight and one-half miles covered.

Five mile stock.—First, Shank, Huntington; second, Zinn, Parkersburg; third, Snedegar, Huntington. Time, 7:29.

Fifteen-mile open.—First, Williams, Zanesville; second, Zinn, Parkersburg. Time, 20:48½.

Time trial.—Williams, Zanesville; time, 1:18¾; Shank, Huntington, time, 1:25¾; Breamer, time 1:27¼.

Twenty-five mile open.—First, Shank, Huntington; second, Stathers, Sistersville; third, Zinn, Parkersburg.

LEBANON'S HOLIDAY MEET.

LEBANON, Ind.—Motorcycle races promoted by G. N. Shelby and E. M. Adney, of this city, drew a large crowd on July 4. The track was heavy, but several of the finishes were fast. Prizes valued at \$300 were awarded the winners.

Ray Hostetter, while taking a turn in the second event, skidded into the fence, but climbed back into the saddle and by sensational riding managed to pull into third place. The officials were Mark Adler and Omer Burgin, of Lebanon, timekeepers; J. H. Kinney, of Indianapolis, State referee; John Hohl and John Merz, of Indianapolis, starters. Summaries:

Six miles, 30.50 cu. in., stock.—Stewart Davis, of Kokomo, Merkel, first; R. L. Kinney, of LaFayette, Harley-Davidson, second; H. Mayer, of Indianapolis, Thor, third. Time, 8:25.

Five miles, 30.50 cu. in., stock.—Noble Shepard, of Kokomo, Merkel, first; R. L. Kinney, of LaFayette, Harley-Davidson, second; H. Mayer, of Indianapolis, Thor, third. Time, 7:35.

Five miles, 50 cu. in.—R. L. Kinney, of LaFayette, Harley-Davidson, first; Noble Shepard, of Kokomo, Merkel, second; Stewart Davis, of Kokomo, Merkel, third. Time, 7:35.

Five miles, tri-county, 30.50 class, stock.—Ray Hostetter, of Indianapolis, Merkel, first; R. L. Kinney, of LaFayette, Harley-Davidson, second; H. Mayer, of Indianapolis, Thor, third. Time, 6:57.

Twenty-five miles, 50 cu. in.—Ray Hostetter, of Indianapolis, Merkel, first; P. O. Heckman, of Kokomo, Merkel, second. Time, 19:33.

Match race, five miles, 30.50 cu. in.—Ray Hostetter, of Indianapolis, Merkel, first; P. O. Heckman, of Kokomo, Merkel, second. Time, 6:32.

THREE SPILLS AT ELGIN.

ELGIN, Ill.—Three spills marked the races held at Wing Park on July 4 by the Elgin Motorcycle Club. Reuben Nelson skidded into the center of the track and sustained a fall which broke one of his toes; Walter Treiber struck the fence on a turn and sustained cuts and bruises, and Edward Smith received a severe shaking up when he ran into the infield railing. The injured riders received prompt medical attention and were able to go to their homes. Despite the slippery condition of the track, due to a heavy rainfall in the morning, all the events were interesting. Summaries:

Five mile, free-for-all.—Snowden Lonberger, Indian, first; Walter Treiber, Indian, second; Charles Treiber, Indian, third. Time, 6:44.

Five mile, 30.50 class.—Paul Deak, Yale, first; Charles Priller, Indian, second; Roland Fletcher, Excelsior, third. Time, 6:38½.

Five mile, 61 class.—Snowden Lonberger, Indian, first; Frank Head, Indian, second; Earl Copper, Excelsior, third. Between 6,000 and 7,000 people witnessed the races.

RACES IN PERRY

DES MOINES, Iowa.—The Des Moines Motorcycle Club, at the invitation of several of the business men of Perry, Iowa, pulled off a series of motorcycle races in that city on July 4.

L. A. Scheible rode a mile on an Excelsior in 1:24, with an automobile to pace him. In one race Scheible was thrown from his machine by a tire blow-out and was slightly bruised.

PECK STARS AT NEWARK

Los Angeles Comet-Chaser Sets Hot Pace for Opening of Jersey's New Board Saucer.

NEWARK, N. J.—Newark's board saucer was opened under auspicious conditions on July 4 when a crowd of 8,000 fans cheered the riders in nine snappy events. The races were so well handled that the program was completed in two hours and a half. Mayor Haussling fired the starting gun in the first event.

Ray Peck (Excelsior), of Los Angeles, was the star of the meet, winning from Arthur Chapple (Indian) in every event they entered. Chapple, however, was a good second except in the last race, the free-for-all, when his motor went dead in the third lap. Fleckenstein (Indian), of Denver, was then placed second, but his machine also went wrong in the last lap and West shot into second position. Fleckenstein gave a great exhibition in the 2-mile, Class A event when one of his tires jumped the rim and wrapped up in the wheel. The rider managed to stop his ma-

New Jersey Club's Racing Stars.

Segelbach, Brown, Drummond.

chine without a fall and the crowd cheered him.

The Class B riders made a good showing, inasmuch as they are new to the game, especially Freddie West, the old six-day bike rider, who has forsaken the bicycle game for a faster sport. Three heats were necessary to decide the winner of the match race between Carl Segelbach and Wm. Brown, both members of the New Jersey Motorcycle Club. In the first heat, Brown who took the lead at the start and was never headed. Segelbach turned the tables in the following heat. In the third and

deciding heat the men were neck-and-neck at the bell lap and inches separated them at the finish, with Segelbach in the lead.

The final event of the afternoon, a four-mile race brought together the Class A and Class B professionals. There were five starters. It was exciting from start to finish. West, after getting off to a bad start, plugged away and came within an ace of nipping Peck at the tape. Johnny King followed West home, while Fleckenstein crept into fourth place. Summaries:

Match race between Carl Segelbach and Wm. Brown—First heat, one mile, won by Brown; time, 54¾. Second heat, two miles, won by Segelbach; time, 1:50¾. Third heat, three miles, won by Segelbach; time, 2:44.

Three-mile open (Class B professional)—First heat won by Albert Carlson, Providence; Freddy West, San Francisco, second; Johnny King, third; time, 2:37¾. Second heat won by West; King, second; Carlson, third; time, 2:28¾.

Two-mile open (Class A professional)—First heat won by Ray Peck, Los Angeles; second, Arthur Chapple, New York; third, Lawrence Fleckenstein, Denver; time, 1:31¾. Second heat won by Peck; second, Chapple; third, Fleckenstein; time, 1:26¾. Third heat won by Peck; second, Chapple; third, Fleckenstein; time, 1:24.

Four-mile free-for-all, professional—Won by Peck; second, West; third, King; fourth, Fleckenstein; time, 3:08¾.

Eddie Hasha, the "Texas Cyclone," blew into town on the 7th, intending to participate in the races Saturday and Sunday, but Manager Paul Derkum postponed them for a week on account of the unfinished condition of the grandstand.

A Birds-Eye View of the United States on a National Holiday in Summer Time.

COLUMBUSITES ON NEW ENGLAND TOUR

Good Roads and Pleasant Scenery Feature Eighteen-Day Trip From Buckeye Capitol to Boston and Return—
Nervy Rider Covers Route a Second Time Alone.

FOLLOWING is a graphic account of a motorcycle tour from Columbus, Ohio, to Boston, Mass., and return, recently made by four Columbus enthusiasts, Clay W. Roberts, O. G. Rowland, R. H. Snyder and W. M. Mathews. The story is written from the diary of Mr. Roberts, who was so well satisfied with this outing that he decided to repeat the trip and is now on his way home after a second lap over the long route. Roberts' story of the original tour is as follows:

In keeping with plans which had been completed several months in advance for a trip into New England we packed the last of our luggage on the evening of June 16 and early on the following morning I slung my trusty camera over my shoulder and we were ready for the start. We chugged out of Columbus at 6.30 a. m. with "Boston or Bust" as our slogan, and before we had gone very far it began to look as if we would have to place special emphasis on the "bust." At Delaware, 25 miles from Columbus, there was a heavy rainfall and we were forced to make a stop. At noon, however, the sky cleared and we were soon under way again. Naturally, the roads were full of mud and water and riding became a question of skill and considerable nerve. Progress was slow but we managed to reach Bucyrus at 7 o'clock in the evening, tired, wet and hungry. Still we were satisfied for we had ridden 61 miles in spite of the delay and the bad roads.

Off for Cleveland.

On the next morning (Sunday) we cleaned our machines and left for Cleveland, where we arrived in the afternoon. We remained there for the night and pulled out for Buffalo at 6 a. m. on Monday morning. Without any difficulty to speak of we reached Buffalo at 5 p. m. on Monday, having traveled 195 miles. We encountered some sand between Geneva, Ohio, and Conneaut, but after crossing the Ohio line we had fine roads. From Erie, Pa., to Buffalo we rode much of the time in sight of Lake Erie and the scenery was impressive. Mile after mile of the route trailed through vineyards. On Tuesday we rode to Niagara Falls and then to Buffalo, leaving on the following morning for Rochester. For this leg of the trip we had two more riders in our party, J. E. Campbell, of the New Era staff, and Frank L. Valiant, of the Merkel forces. Campbell piloted us to Batavia and Valiant accompanied us to Fonda where he met with an accident. Just before we reached Batavia, Mathews, of our party, was thrown from his machine and his motor was so seriously damaged that it was impossible to make road repairs. Accordingly, we made arrangements for him to ship his machine to Boston and meet us there.

Welcomed in Rochester.

When nearing Rochester Valiant's machine broke a connecting rod and piston, and while he was being towed into the city

he and his machine were run down by a woman driving an automobile. Both Val and his mount were in bad shape when they finally reached Rochester. A repair man worked all night and all the next day on the damaged machine, while we viewed the sights of the city. On our arrival in Rochester we met Dr. Clint LaSalle, vice-president of the Atlantic District of the F. A. M., who spent the evening with us and escorted us about. The roads in and about Rochester are in fine shape, the section from Scottsville being particularly good.

We left Rochester at 6 p. m. and rode to Geneva where we put up for the night. This was the only place on the route, by the way, where they tried to separate us from all the money we had, so in future we will not make a stop there.

On Friday morning we pulled out of Geneva, and at Cuyahoga Lake we were ferried across on an old canal boat propelled by a motor. The scenery in this district is beautiful, and it was with reluctance that we continued on our way. We had dinner at Syracuse, after riding over some rolling country, and then proceeded to Rome, where we remained overnight. We encountered quite a few hills, but as the road surfaces were good, we experienced no serious trouble. Several toll gates proved novel to us, as we have none in Ohio. Early on Saturday morning we left Rome and headed for Pittsfield, Mass., through the picturesque Mohawk Valley. From Rome to Little Falls the road is in excellent condition, but from the latter point to Fonda the going is rough and there are a number of hills. The beautiful valley with its winding river makes the rider forget his road troubles, however. Everything had gone well with us since leaving Rochester, aside from a broken inlet valve on my machine and several punctures for the other members of our party, small matters in our opinion.

Valiant in Bad Spill.

At Fonda we were due to have serious trouble, for Valiant lost control of his machine when rounding a bad hill and crashed into a stone wall, which is intended to protect vehicles against dropping over a 40-foot bank to the New York Central railroad tracks. Through the liberal use of cold water we managed to bring Val around, but his machine was so badly damaged that it could not be patched up for the remainder of the trip to Fonda. Accordingly we hid it in a clump of bushes and carried Valiant into the town on the tank of one of our machines. We left him in Fonda and then struck out for Albany. The road was good until we reached Amsterdam, but at this point repairs were being made on the State road along the river, and we were compelled to take to the hills. We found some steep grades, but none that a good 7 h. machine could not climb. After riding about 10 miles we struck the State road again, but repairs were also being

made at this point, and our progress over it was slow.

A Surprise at Albany.

When we arrived at the Merkel agency in Albany at 5 p. m. we were told that Mathews who had damaged his engine at Batavia, had just pulled out for Pittsfield. This came as something of a surprise, as we had taken it for granted that we would not see him again until we reached Boston. The road from Albany to Pittsfield is ideal. There is quite a steep climb over Mt. Lebanon, but the road is in good condition and is well protected at all danger points. When the summit of the mountain is reached there is a remarkable view which forces the rider to decide on the spot that he will return to take advantage of it again. When we resumed our trip to Pittsfield we had traveled only three miles when we caught up with our old friend Bill Mathews, chugging along contentedly and keeping his weather eye open for us. There were handshakes all around, and then Bill told his story. He had remained at Batavia for two days and had his machine repaired instead of shipping it to Boston, and had then started out to overtake us. He found at Oneida that we were only fifteen minutes ahead of him and decided that he could catch up with us at Utica. We went to Rome, however, and he lost all trace of us.

The Run to Boston.

On Saturday night we had a reorganization party in Pittsfield, and early on Sunday morning we headed for Boston. As we jogged along through inviting woodland, over rustic bridges and up-winding roads we agreed that it would be difficult to find a more attractive district, and my camera came into action more than once. We arrived in Springfield, Mass., at 2 p. m., and then proceeded to Worcester, where we remained overnight. On Monday morning we visited the Graton & Knight factory, and also met Mr. Persons, the genial head of the Person's saddle factory. In Boston we made the acquaintance of W. H. Mann, the hustling Merkel agent. After looking around the city we pulled out at 3.30 p. m. on Tuesday for Providence, R. I., where we remained until the following morning. Our next jump was to Narragansett Pier. Near Westerly, Conn., we found the worst stretch of road on our entire trip. The sand was so deep that we could barely make headway, but we finally reached the ferry and crossed over the Thames river into New London. Here we learned that the ferry at Lime had been burned and that it would not be in operation again for several days, so we decided to ride northward through Connecticut. After traveling a few miles, however, we were glad to return to New London as we could not make headway through the sand.

On our arrival back in New London we managed to make arrangements for shipping our machines on a railroad freight

IN THE EMPIRE STATE AND NEW ENGLAND

1. Near Erie, Pa. 2. Cayuga Lake Ferry. 3. "Held Up" by a toll-keeper. 4. A stop for water in the Berkshire Hills. 5. The first puncture. 6. Toll-gate near Syracuse. 7. "The Four of Us." 8. Near Fonda, N. Y., where Valiant hit stone wall. (Story on opposite page.)

boat running to New York City, and we also made the trip on this craft. We spent Thursday in New York and on Friday we rode to Philadelphia, Pa. Here our party divided, Mathews and myself riding on to Pottstown, and Rowland and Snyder announcing that they would tour a bit in southern Pennsylvania and then crate their machines and start for home. On reaching Pottstown I decided to crate my machine and ship it back, as I had to return to work on the following Monday morning, but Mathews completed the run to Columbus. The total distance covered was 2,460 miles for Mathews, and the mileage for the other members of the party was not much less. We had been on the road 18 days, and Mathews' breakdown at Batavia was the only serious trouble encountered by any member of our quartet.

Second Tour a Success.

On his second trip from Columbus to New England Roberts was accompanied as far as Geneva, Ohio, by Frank Thaler. The latter met with an accident at that point and was obliged to turn back, but Roberts plugged on alone, reached Buffalo in good time and then made the trip across New York State without trouble. After a short tour in New England he rode down along the Hudson to New York City, dropped in at the office of *MOTORCYCLE ILLUSTRATED*, and then continued on his way to Philadelphia. He reports that the roads eastward from Cleveland are in fine condition except for a few stretches which are undergoing repairs. From Erie to Buffalo the roads are good and the same conditions prevail between Buffalo and Rochester. The river road across the State to Albany offered

good going, and on the whole Roberts had no room for complaint as to roads. On his first trip eastward Roberts mounted a Flying Merkel twin, but on his last tour he rode a 7-Indian.

NEW ROUTE TO CONEY ISLAND

A NEW route to Coney Island, N. Y., is now open and affords quite a short cut to the popular amusement resort, and also runs close to the Brighton Beach Motordrome. Starting from Brooklyn, take Bedford avenue, from any of the bridges and follow it to Eastern Parkway and there instead of turning right down Eastern Parkway toward Prospect Park keep straight ahead on Bedford avenue, crossing Eastern Parkway and leaving the Slocum statue on the left. Immediately down the steep hill pass the armory of Squadron C, also on the left. On the right will be seen the concrete foundations for the grand stands of Ebbets Field.

Keep straight on, crossing the railroad tracks at Malbone street. Pass Lincoln road, which leads to gate in Prospect Park, and also pass Robinson lane-Parkside avenue, the usual routes across to Ocean Parkway. Keep straight on Bedford avenue, passing the Cortelyou clubhouse on the left and immediately thereafter crossing the tracks at Flatbush avenue.

Here slow up, passing the billboard fence on the right, and on the sharp curve leave Bedford avenue, passing an apartment house on the right and enter Foster avenue, which has just been asphalted. Keep straight on through South Midwood, over the Brighton Beach covered railroad crossing and over the trolley crossing at Coney Island avenue to Ocean Parkway. The parkway itself will be recognizable by its width, but there is an iron

railing surrounding the old Shults trotting stables on the right and the new brown brick church on the western side of the Ocean Parkway which will serve as landmarks. Here turn left into Ocean Parkway, Foster avenue being at this point one and one-half miles from Prospect Park and four miles from Coney Island.

Coming back from Coney Island toward New York after leaving the defunct trotting horse speedway at Twenty-second avenue there is a slight rise in the road at the Long Island Railroad tracks over the covered cut, then Foster avenue with its single row of electric lights on its north side comes in immediately on the right. The iron railing surrounding the stable is then on the left hand side of Foster avenue. The church is also on the left behind the trees. Keep straight on Foster avenue to its junction with Bedford avenue at Flatbush avenue and then to the Slocum statue at Eastern Parkway and Bedford avenue.

MORE POWER TO HEYBURN!

WASHINGTON, D. C.—Senator Heyburn, of Idaho, has introduced an amendment to the sundry civil bill now before the Senate, providing for an appropriation of \$250,000 for the purpose of improving the highways in the Yellowstone National Park. The expressed object of the appropriation, according to Senator Heyburn, is to make it easier and safer for operators of motorcycles, and other motor vehicles, to use the roads in the Yellowstone Park.

SIX out of nine rural mail carriers operating out of Bridgeton, N. J., are delivering their mail on motorcycles.

OMAHA DEALER COMPLETES A LONG GRIND

W. E. Dewey.

Greeted by W. F. Remppis in Reading, Pa.

W. E. DEWEY, of Omaha, Neb., western representative for the Reading-Standard Company, pulled into Reading, Pa., on June 29 after a most remarkable trip from his home city. Mounting an R-S twin, Dewey overcame all kinds of obstacles, plugged through good, bad and indifferent roads, smashed his rear wheel twice and still completed the run of 1,462 miles in 64 hours' riding time. He left Omaha on June 23 at 1 p. m. and arrived in Reading at 12.15 p. m., six days later. All in all the performance is one of the best that has been recorded for a cross-country trip, and the success attending it has led Dewey to announce that he will probably attempt to lower the trans-continental record from San Francisco to New York. If his present plans do not miscarry the nervy Omaha dealer will start from the Pacific coast in September, taking the northern route to New York City, via Chicago. He intends to ride a Reading-Standard twin and is convinced that he can clip days from the present record.

It is worthy of note that Dewey carried no luggage on his recent trip from Omaha to Reading and that his tool kit was a light one. He felt competent to meet any emergency on the road, and therefore took chances at which many a veteran rider would have balked. That he finished the trip in the remarkable time noted proves that his confidence was not misplaced. His "log" shows that the roads were in fine condition from Omaha to Chariton, Iowa, this jump being made in the first day's riding. When he left Chariton for Burlington road conditions were not so favorable, but fair progress was made. The roads were graded up in the center so that considerable skill was required to avoid spills. At Burlington Dewey crossed the Mississippi on a ferryboat, and then ran into 40 miles of bad going. For some distance from the river the highway was almost impassable, being muddy and deeply rutted, but the Omaha plugger stuck to his saddle. When he reached Monmouth, Ill., he found the roads still in bad condition and from this point to Peoria the going was of the heaviest kind.

The start of the third day's trip was from Peoria to Bloomington. On this stretch the poor roads continued, but from Bloomington to Danville better time was made. Twenty miles west of Danville the rider encountered his first trouble in the shape of a bad puncture. He managed to make repairs and then plugged onward, but after riding three miles he crashed into a deep washout in the road and smashed his rear wheel. For a less intrepid rider this accident would probably have ended the trip, but Dewey had no idea of giving up the fight and after four hours of hard work he was able to start again, having hammered his rear rim into rideable condition with a rock. On reaching Danville he made further repairs and then rode on to Indianapolis. Between Danville and the latter city he found fair roads.

The trip for the fourth day was from Columbus to Pittsburgh. Very choppy roads were encountered between the Buckeye capital and Bellaire, Ohio, but from Bellaire to Pittsburgh the conditions were improved. The fifth day put the rider to some of the most severe tests of the entire trip. From Pittsburgh to Shippensburg, over the Allegheny mountains, the roads were rough and very rocky and to add to his troubles Dewey was caught in a typical mountain storm. While going down a steep muddy grade his machine skidded into a ditch and the rear wheel was smashed again. Once more a rock was called into action and the rim was hammered into such shape that riding was possible. There was no place within reach where tools might have been obtained and the heaviest tools in Dewey's kit were an 8-inch wrench and a pair of pliers. Eight miles west of Shippensburg another bad puncture delayed the rider. He had run out of cement, but being supplied with a number of self-sealing patches to was able to make repairs. He admits that if his kit had not contained these patches there would have been a decidedly different story to tell concerning his time for the trip.

On Saturday, the sixth day, Dewey made the run from Shippensburg to Reading over good roads and without difficulty. His record for the trip showed that he had used 16 gallons

and 1 quart of gasoline on the journey of 1,462 miles, so that his consumption was at the rate of one gallon for 89.97 miles. Dewey reports that he had no engine trouble throughout the grind and that he was not even compelled to clean a spark plug. But for the unfortunate accidents in which his rear wheel was damaged the Omaha rider is convinced that he could have cut down his running time at least half a day. The fact that he made the run from Omaha to Reading in six days in spite of the delays leads him to believe that with ordinary luck he can clip the trans-continental record now held by Volney Davis.

After laying off for a few days' rest in Reading Dewey visited New York City, dropped in at the office of *MOTORCYCLE ILLUSTRATED* to leave a few modest notes on his trip and then started homeward by train.

FAVORED BY CONGRESS.

WASHINGTON, D. C.—Eight motorcycles are now in use by the government department in Washington, and the officers in charge of the department using them are loud in their praise. Comment has been caused by the extent to which the motorcycle has figured in legislation before Congress at the present session, illustrating the recognition of it by men in official life. One of the leading members of Congress, discussing the extent to which the motorcycle is now used for both pleasure and business purposes, says that he expects remarkable developments in the use of the machine in the near future.

It is the favorable attitude of members of Congress toward the motorcycle which gives rise to the belief that measures certain to come, providing for the extension of its use in government affairs, will be strongly supported. The most recent use to which the motorcycle has been put by federal department heads is in connection with messenger and police service in different national parks.

C. F. Gates, of *Pacific Motoring*, is well on his way to Columbus by motorcycle.

TANDEM TOUR TO CONVENTION CITY

Denver Motorcyclist and His Wife Ride to Columbus Over Mountains and Through Mud and Sand Without a Spill or Even a Bent Pedal—Amusing Incidents Along the Route.

L. L. PARKER, an enthusiast of Denver, Col., accompanied by his wife, recently completed a tandem trip from the Mile High City to Columbus, Ohio, without a spill or other road trouble aside from several punctures. A Merkel 6 was used for the jaunt of 1,961 miles, and despite the fact that road conditions ranged from fair to bad there were no serious delays. Mr. Parker tells his story as follows:

"For a long time my wife and I had talked of touring eastward on our Merkel 6 and in vain we tried to get up a party of two or three other couples to accompany us. Finally we decided to make it alone. Our friends said we were foolish to undertake the long trip and that no motorcycle would prove capable of carrying two heavy-weights over such a long route as we proposed, particularly as we had a lot of sand and mud and several mountain ranges to traverse. Having confidence in our machine, we were willing to take our chances. We planned to start from Denver on June 15, so that we could allow 32 days for the

Mr. and Mrs. Parker.

run to Columbus for the National F. A. M. meet. All of this time would not be required, of course, so we planned to visit relatives en route.

"However, the old saying, 'There's many a slip 'twixt the cup and the lip,' proved true in our case. My plans and the plans of my employer did not dovetail, and when I asked for three months off, from June 15 to September 15, I was told that he would think the matter over. This looked so good to me that I let it go at that, but on May 1 he came to me and said: 'If you want such a long vacation, be ready to start it May 10.' You can imagine how that upset us, because every woman is like every other woman in the matter of preparation. When I told my wife that she had only ten days to get ready for the trip

F. L. Valiant Congratulating Parker Upon His Arrival in Middletown.

she said positively she would not go and went to bed, rather out of humor with me, with my employer and the world in general, but after a good night's rest she changed her mind, like a woman always does, and was up at daylight next morning making things hum.

"The first 50 miles was splendid riding, but my brother-in-law's machine broke down and caused me to make a forty-mile ride to Fort Morgan for repair parts for him. We finally got to Fort Morgan, and after half a day there we started out again. Soon we ran into a 24-hour rain, which made us lay over at a ranch house for one day and two nights.

"After bidding our hosts at the ranch good-bye, we set out over very muddy roads. As far as Lincoln, Neb., we followed the recognized automobile road, and then went south through Beatrice, Neb., to Wyomere. At Beatrice we stopped for repairs on my partner's machine, and as the roads through this part of the country were pretty rough and it was rather late (7 p. m.) we were in doubt whether to try to make Wyomere that night, as the distance was 18 miles. However, the natives told us we would have fine, level roads from there on, and we thought we would try and make it before bedtime. I wish some of the boys in the Columbus tours could have seen those 'level' roads. At one place it was so steep I stopped my machine and asked a rancher what they call a level in that part of the country. His reply was: 'Well, as long as we can pasture it we call it level, but, of course, when the stock can't stick on the hillsides, we call it hilly.'

"There were lots of amusing incidents during the ride, but I think the most welcome sign I saw was at a railroad tank station, coming through Nebraska. We had ridden practically all day and were pretty tired and hungry, with no chance of getting to a town before night, and my wife was beginning to wish that she had not come on the trip when we saw a railroad tank on the horizon. We knew that this meant shelter, if not food, but we were agreeably surprised when we chugged up to find that there was a station there, embellished by a sign which, despite our stiffness from the long day's ride, made us smile. The sign bore the quaint legend:

Meal, 25c. Square Meal, 50c. Gorge, 75c.
Wearied Strangers Fill Up and Bust.

"Our worst trouble through Nebraska, Kansas and Missouri was to procure air-cooled oil and to get out of the small towns once we got in. A man would have to listen to everybody in town to find the oil, and then the best we could get was an inferior grade of Polarine, and by the time we managed to get hold of this there would be such a crowd around the machines that we would have to beg them to get out of our way so that we could get started. Some of the people had never before seen a motorcycle, and naturally, we were deluged with questions of all kinds. One man near Macon City said he thought there

ought to be a law against going around the country on a tandem machine. 'It's bad enough for a man to risk his own fool neck on a go-devil like that there benzine buggy,' he said, 'without making his wife risk hers, too.' When I told him that my wife was anxious to accompany me, that we had not a single spill and that her health was better than when she started, he was incredulous.

"One incident occurred after we had shipped our camera ahead on account of the rough roads that made me regret my inability to obtain a picture. The lady of the house where we were given shelter over night was six feet one inch tall and weighed 240 pounds. During the evening's conversation she suddenly decided she would like to have a ride on the motorcycle, as she had never been on anything faster than a horse. The next morning she persuaded my wife, who weighs about 150 pounds, to let her try to put her suit on. Well, she got it partly on, and with the aid of a dozen big safety pins—the kind that are used to pin horse blankets around live stock—she made the skirt stay up high enough so that she could cover the gap with a three-quarter winter coat she had. Then I said to myself I'm in for it. All I could do was to groan and accept the issue cheerfully, for the people had been hospitable and had refused to accept a penny for our meals and lodging; therefore, I grinned and prepared for the worst. We went out into the main street and it seemed that everybody in town had got wind of the affair and had turned out to see the fun, and fun it nearly proved to be, for 240 pounds on a tandem attachment, and said 240 pounds never having been on a machine before, is rather unwieldy baggage for even as hardy a rider as myself. However, after three or four attempts, I made good. I did not take any chances; just went around one edge of the town, so that I would not have to risk getting off and on again. When we came back to town, after making a circuit of about five miles, you would have thought there was a holiday. It seems that after we had started fifty or sixty people who had been up when we began the ride had quickly spread the news throughout the town, and there were two or three hundred people lined up in the center of the town to watch the triumphant approach of the trusty Merkel 6 and the champion heavy-weight of the town. I think I lost three pounds during the ordeal.

"When I left Colorado the farmers thought they were slow with their spring crops, on account of the wet, cold season and were kicking to beat the band, but when I crossed the river at Beardstown the bottom land was mostly under water. Instead of swearing, the farmers were all out fishing and enjoying themselves. Coming into Decatur we found very good roads, as it had not rained for about ten days. After we had eaten we saw it was going to rain, and not wishing to get laid up in the mud we decided to get out, which we did, leaving town on the east side, while it was raining on the west side. We kept ahead of the rain from Decatur Ill., to Covington, Ind., a distance of 110 miles, making it in five hours, with two stops, one for gasoline and one to fix a puncture.

"After striking the Indiana roads, we came as far as Indianapolis, where my wife

wished to visit some relatives for several days, so I decided that I would run down to the Miami Cycle & Mfg. Company's plant, where the Flying Merkels are made. There I was greeted by Joe Merkel, President Jacoby, F. L. Valiant and the rest of the boys, and to say that I was treated royally is putting it mildly. After spending a few days at the factory I went back and picked up my wife, and then we toured into Columbus.

"In conclusion, I will say that outside of punctures, we had no trouble whatsoever, despite the rough roads and the extra weight that our machine had to carry. I consider it marvelous that we succeeded in getting through without even breaking a pedal. Our route from Denver was via Fort Morgan, Sterling, Haxton, Holyoke, Col.; Culbertson, McCook, Holdridge, Hastings, Lincoln, Wymore, Neb.; St. Joseph, Chillicothe, Macon City, Hannibal, Mo.; Quincy, Springfield, Beardstown, Decatur, Danville, Ill.; Covington, Attica, La Fayette, Frankfort, Lebanon, Indianapolis, Richmond, Ind.; Dayton and Springfield into Columbus. The total distance was 1,961 miles, but my wife and I had covered a little over 5,200 miles on the same machine before starting the trip."

BARIBEAU CANADIAN CHAMP.

Winnipeg Rider, Mounting an Indian, Took Four Out of Five Championship Races at Hamilton.

ANYTHING in the way of motorcycle racing that had ever been seen in Canada was far excelled at the first annual championships of the Canadian Motorcyclists' Association, held at Hamilton, Ontario, on Monday, July 1, before 4,000 excited spectators.

The coveted title of Canadian champion was captured by Joe Baribeau, the Indian rider, of Winnipeg, who fought his way to the front in four out of the five championship events on the card, in spite of the greatest opposition, which included Don Klark, of Detroit, and Don Johns, of Los Angeles. Baribeau created a sensation when, driving his trusty mount like a man of steel, he began to ride away with title after title, accomplishing his greatest triumph in the feature twenty-five-mile grind, in which he overcame a three-mile lead possessed by Don Johns and won out in record time.

Klark took the only other trade rider event on the program, the five-mile 30.50 race, in which he straddled a four-valve Indian machine. Klark also found some consolation, however, by taking Johns' measure in a special ten-mile invitation race. He proved far too strong for the Excelsior expert, who suffered all kinds of ill-luck in the way of carburetor trouble, and won in 8:55, or at the rate of 67 miles per hour. The previous Canadian record for the distance was three minutes slower, but the former mark was registered on the half-mile dirt oval at Toronto.

Baribeau's time in the 25-mile grind was 27:10, which bettered Harold Cole's recognized record for the distance, made on a half-mile track, by almost four minutes. The times of the races were exceptionally good, considering the condition of the track which was five inches deep in dust and sand

on the corners. There were many spectacular skids, but no spills.

Dan Davis, an Indian rider of Toronto, captured two of the private owners' championship events. A five-mile belt drive race went to N. Newport, of Toronto, who was the only English rider to score, the machine being an English Triumph. Bob Scott, Indian, of Toronto, was the winner in the five mile 4 h. chain drive contest.

Harold Cole, Toronto's daring young Excelsior racer, did not start in a single race, having broken his machine before the meet. Summaries:

Five miles, 61 cu. in. class, private owners, stock.—Won by Dan Davis, Toronto; second, O. Murray, Hamilton; third, Rutledge, Toronto; all Indians. Time, 5:38 1/5.

Ten miles, 54 cu. in. class, open championship.—Won by Joe Baribeau, Winnipeg; second, Don Klark, Detroit; third, Frank Kerr, Toronto; all Indians. Time, 10:04.

Five miles, 61 cu. in. class, open championship.—Won by Baribeau, Winnipeg; second, Frank Kerr, Toronto; both Indians. Don Johns, Excelsior, did not finish. Time, 4:34.

Five miles, 30.50 cu. in. class, private owners, chain drive.—Won by R. Scott, Toronto; second, Tom McGee, Toronto; third, Stellaway, Binbrook; all Indians. Time, 6:08 3/5.

Ten miles, 61 cu. in. class, open championship.—Won by Joseph Baribeau, Winnipeg, Indian; second, Don Johns, Los Angeles, Excelsior; third, Don Klark, Detroit, Indian. Time, 9:13.

Five miles, 30.50 class, open championship.—Won by Don Klark, Detroit; second, Joe Baribeau, Winnipeg; third, Frank Kerr, Toronto; all Indians. Time, 5:24 2/5.

Ten miles, 61 cu. in. class, private owners.—Dan Davis, Toronto; O. Murray, Hamilton; Warwick, Toronto; all Indians. Time, 11:02 1/5.

Ten miles, invitation.—Won by Don Klark, Detroit, Indian; second, Don Johns, Excelsior. Time, 8:55.

Five miles, 30.50 class, private owners, belt drive.—N. Newport, Toronto, Triumph; second, T. Smith, Toronto, Reading Standard; third, Hoar, Toronto. Time, 6:36 2/5.

Twenty-five miles.—Won by Baribeau; second, Don Johns; third, O. Murray, Hamilton. Time, 27:10.

SEEKING FIRST PLACE.

WASHINGTON, D. C.—The National Capital Motorcycle Club, which now claims to be the second largest club in point of numbers affiliated with the Federation of American Motorcyclists, hopes to take first place before the end of the year, and a campaign for membership is on. The club is in excellent financial shape, having approximately \$500 in the treasury. It has in prospect a number of "stunts" which it plans to pull off within the next few months. A hill climbing test will be held within the next few weeks, but the details have not yet been entirely worked out.

FATAL SPILL AT SAN JOSE.

SAN JOSE, Cal.—Reed Orr, of Sacramento, and W. F. Baker, of this city, sustained fatal injuries in a spill on the track at the San Jose Driving Park on June 30. The men were competing in a motorcycle race which had worked the spectators to a high pitch of enthusiasm, when the crash came. C. D. Reade and E. A. House, two riders well known in this vicinity, also went down in the spill and were seriously hurt.

RECORDS ARE OFFICIAL.

CHAIRMAN THORNLEY, of the F. A. M. competition committee, has received all the affidavits concerning the record trials made on the Playa del Rey (Cal.) saucer on May 17 and May 24 by Ray Seymour and Lon Claffin, in the pro and amateur classes, respectively, and announces that he has formally accepted the records.

THE Leavenworth, Kans., Motorcycle Club is intending to co-operate with the Motor and Good Roads Association in that city with a view of furthering road improvements.

THE F. A. M. HOUR CHAMPIONSHIP RACE

The photograph to the left shows Don Klark on one of the turns.

Below, reading from left to right, are E. G. Baker, who took third place; J. U. Constant, the winner, and Don Klark, who was second.

HOPES FOR MILE IN 30 FLAT.

"I EXPECT to see a mile turned off in 36 seconds flat on the new Columbus motordrome," said Ray Seymour in a recent conversation with S. A. Falor, sales manager of the motorcycle tire department of the Goodyear Tire & Rubber Company. "I am not prepared to advance an opinion as to what will be the limit of speed on a motorcycle, but I feel that if I had an opportunity to pilot my machine over the straightaway track at Daytona, Fla., I could lower the time for the mile to 30 seconds." Seymour conferred with Goodyear experts while in Akron and offered some practical suggestions as the result of recent observations concerning racing tires.

WARD AND WHITTTLER THRILL FANS

Big Crowds at Salt Lake City Saucer See Old Rivals in Tight Finishes—Ward Lowers the Wandamere Record.

SALT LAKE CITY, June 14.—The large crowd of spectators at the Wandamere Motordrome last night was given a real treat. The star of the program was Al Ward, who took first money in every event he entered. In the third race Ward established a new record for the Wandamere track at three miles, covering the distance in 2:08½. The best race of the meet was the six-mile, Class A professional. The five riders who started made a good get-away. Peck immediately took the jump. Before he had gone a lap, however, Ward took the lead and Whittler swung in behind him, with Peck, Brodbeck and Bernstrom following in the order named. This order was maintained until the seventh lap when Bernstrom's machine went bad and he quit the race. On the ninth lap Whittler passed Ward, and it looked as if he was going to win. While everybody was watching these two, Peck and Brodbeck succeeded in making things interesting by passing the leaders. This advantage did not last long, however, and as soon as Whittler and Ward again took the lead, Ward, with a lap and a half to go, shot around Whittler and won by three lengths. Brodbeck won third from Peck by about a foot, both men finishing twenty yards behind Whittler.

The seventh event was a team pursuit

race between the engineer team, composed of Duckworth and Ben Johnson, and the firemen team, Hitchcock and O. Johnson. The teams were started on opposite sides of the track and for several laps they kept a half lap apart. Soon, however, O. Johnson began to work up on his opponents and it looked as if the firemen would make quick work of the engineers. At this juncture, Hitchcock's machine went to the bad and he dropped out, leaving all the work for Johnson. Johnson kept after the engineers and finally overtook both of them, covering a distance of four miles and half a lap. Summaries:

First heat of three-mile Class B, professional—O. Johnson (Indian), first; Duckworth (Indian), second; Ben Johnson (Indian), third. Time, 2:26.

Second heat of three-mile Class B, professional—McNeil (Indian), first; Bernstrom (Indian), second; McCall (Indian), third. Time, 2:17½.

Three-mile Class A, professional—A. Ward (Indian), first; Whittler (Merkel), second; Brodbeck (Merkel), third; Peck (Excelsior), fourth. Time, 2:08½.

Final, three-mile Class B, professional—McNeil (Indian), first; O. Johnson (Indian), second; Bernstrom (Indian), third. Time, 2:25½.

First heat, Class A, professional—Ward (Indian), first; Brodbeck (Merkel), second; McNeil (Indian), third. Time, 2:13½.

Second heat, Class A, professional—Whittler (Merkel), first; Peck (Excelsior), second; Bernstrom (Indian), third. Time, 2:13½.

Team pursuit race, firemen team composed of O. Johnson (Indian), and Hitchcock (Indian), won. Distance, four miles and one-half lap. Time, 3:21.

Final, six-mile Class A, professional—Ward (Indian), first; Whittler (Merkel), second; Brodbeck (Merkel), third. Time, 4:24½.

SALT LAKE CITY, June 21.—The races at Wandamere last night resulted in victories for both Ward and Whittler in the professional Class A. The five-mile Class A professional was won by Ward after a hard fight. Ward led most of the time, as Whittler refused to take the lead. Peck and Brodbeck jockeyed some, but the fight was between Ward and Whittler. With Ward in the lead one lap from the tape, Whittler endeavored to go around him, but he was unable to do so.

In the eight-mile Class A professional, Ward and Whittler again fought for supremacy. Ward got a bad start as he was on the running board regulating his machine when the race was started. Brodbeck got a big jump, and it was several laps before Ward was able to catch him. About four laps from the finish Ward's machine was seen to slow down and Whittler passed him. Summaries:

First heat, two-mile match race—McNeil (Indian), first; Bernstrom (Indian), second. Time, 1:31½.

Second heat—McNeil, first; Bernstrom, second. Time, 2:08.

First heat, five-mile Class B, professional; two-miles—McCall (Indian), first; O. Johnson (Indian), second; Duckworth (Indian), third. Time, 1:34.

Second heat, Class B, professional—McNeil (Indian), first; Hitchcock (Indian), second; Johnson (Indian), third. Time, 1:39.

Five-mile Class A, professional—Ward (Indian), first; Whittler (Merkel), second; Brodbeck (Merkel), third. Time, 3:36½.

Final, five-mile Class B, professional—McNeil (Indian), first; O. Johnson (Indian), second; Duckworth (Indian), third. Time, 3:39½.

Three-mile invitation Class B—Ben Johnson (Indian), first; Bernstrom (Indian), second; Duckworth (Indian), third. Time, 2:29.

Eight-mile Class A, professional—Whittler (Merkel), first; Brodbeck (Merkel), second; Peck (Excelsior), third. Time, 5:47½.

RODE ON BARE RIM

Washington Speedster Blew Front Tire in Baltimore Race, but Scored a Spectacular Victory.

BALTIMORE, Md.—One of the most thrilling motorcycle races ever pulled off in this vicinity was held in connection with an automobile meet at Laurel, Md., on June 29. The spectators were treated to something decidedly out the ordinary in a match race between Thomas Dedge, of Washington, D. C., and McPherson. Dedge got the jump on McPherson at the crack of the pistol and continued to gain for five laps. Then his front tire blew out, almost causing him to collide with a fence. At the time Dedge was leading his rival by three-quarters of a mile.

Instead of changing wheels, as he had a chance to do, the Capital boy deliberately cut the casing from his front wheel and started after his opponent, who had passed him and was leading by half a mile. The pursuit continued and Dedge crept closer and closer to his opponent. The big crowds cheered him as he swayed around the track. His determination not to be handicapped by the absence of a front tire finally won out, and amid great excitement he passed his rival and came under the wire the victor.

The meet was held on two days and there were two motorcycle events each afternoon. Freddie Tiemeyer, of this city, easily won the two races on Friday, with Clayton Sandruck, also of Baltimore, in the running. Dedge beat out Tiemeyer in the first race on Saturday, before he ran his thrilling match race. Summaries:

Friday—First race, three miles, open, 30.50 machines—Freddie Tiemeyer, Indian, first; Thomas Dedge, Indian, second; Clayton Sandruck, Excelsior, third. Time, 3:39.

Second race, five miles, open, 61 ins. displacement—Freddie Tiemeyer, Indian, first; Clayton Sandruck, Merkel, second; Alvin Day, Indian, third. Time, 5:27.

Saturday—First race, five miles, 61 ins. displacement—Thomas Dedge, Indian, first; Freddie Tiemeyer, Indian, second; Clayton Sandruck, Merkel, third. Time, 5:12½.

Second race, 10-mile match race, 61 ins. displacement—Thomas Dedge, Indian, first; McPherson, Excelsior, second.

AN OHIO RACE MEET.

ONE THOUSAND race followers witnessed spirited motorcycle events at New Boston, a suburb of Portsmouth, Ohio, on June 23, when a program was arranged by Tide Davenport, Indian agent in Portsmouth. The races were run under an F. A. M. sanction, P. R. Brehmer, of Zanesville, acting as referee. Summaries:

Three miles, open—Williams (Indian), first; Tullis (Thor), second; Brunton (Indian), third. Time, 4:25.

Five miles, open—Tullis (Indian), first; Williams (Indian), second; Brunton, in third place, retired by accident. Time, 6:15.

Five miles, for Portsmouth club members only—

Thomas Dedge.

Ray Starlin, first; George Keilman, second; Karl Gims, third. Time, 7:08 1-5.

Ten miles, open—Tullis (Thor 4), first; Williams (Indian), second; Nourot, third. Time, 13:04.

Pursuit race, open—Tullis and Williams eliminated the other contestants in fifth mile; in eighth mile Williams broke a chain, thus giving the event to Tullis, who had been slowly gaining.

Twenty miles, open—Tullis broke a valve in ninth mile when in the lead, leaving Williams to win easily. Nourot in second place. Time, 26:09.

FIELD DAY RACES

BROOKLYN, N. Y.—John U. Constant lowered his one-mile track record at Brighton Beach on June 26 by traveling the route in 52½ seconds, 3¼ seconds faster than his best previous time. The exhibition was given in connection with the annual field day program of Brooklyn Lodge No. 22, B. P. O. Elks, at the Brighton Beach track. Over 8,000 spectators were on hand. J. B. French, Frank Baker and Constant gave a thrilling exhibition in a 10-mile event, the latter winning by a small margin over French. Time, 10 minutes 3 seconds.

READING ENDURANCE RUN.

ANNOUNCEMENT is made that the reliability run of the Reading (Pa.) M. C., which was postponed from Sunday, June 16, because of inclement weather, will be held on Sunday, July 14, regardless of weather conditions. At latest reports thirty riders had entered, and the club officials look forward to a highly successful event. There will be a prize for every perfect scorer. Among those who are prominent in boosting plans for the run is James Mayo, Flying Merkel agent in Reading.

TIEMEYER HURT IN SPILL

Baltimore Rider Figured in Crash During July 4 Races on Bennings Track.

WASHINGTON, D. C.—The motorcycle races held at the Bennings track on July 4, under the auspices of the Central Labor Union, were successful from a standpoint of speed and the interest manifested by motorcyclists, but the crowd was not what was expected. The races were marred by an accident in the second event, a five-mile open contest. M. Tiemeyer, of Baltimore, and William Fuerstine, of Norfolk, were in a neck-and-neck race on the fourth lap when the carburetor on Fuerstine's machine became loose and, in reaching over to adjust it, he caught the spark plug by mistake. He sustained an electric shock, temporarily losing control, and his machine began wobbling. Both Tiemeyer and Fuerstine were confused and their machines collided. Tiemeyer was thrown from his machine, sustaining bruises which necessitated his being taken home. Fuerstine continued in the race.

The first race, a three-mile novice, went to Bernard Sherwood, on a Harley-Davidson. His time was 4:38. Oscar Thorne, on a Haverford, was second. In the second event, the five-mile open, the Fuerstine-Tiemeyer spill enabled Tom Dedge, Indian, to win. He was the only one of six entrants to finish. Fuerstine, on an Indian, won a hard-earned victory over J. Dodge in the third event, a five-mile open, in 5:46. Fuerstine also won the 10-mile handicap on his Indian in 11:51.

TWO MOTORCYCLE EVENTS.

TWO motorcycle races were staged in connection with an automobile race program, held in Toledo, Ohio, on Saturday, June 15, one event at two miles and the other at five. In the former W. H. Bailey (Excelsior) was in first place; M. Garbner (Yale), second, and Herbert Gretzler (Yale), third. Time, 3:07. O. J. Oberwenger won the five-mile event on an Excelsior machine; A. G. Happ (Thor) was in second place, and William S. Bailey (Excelsior), in third position. Time, 7:00. A. B. Coffman, of the Consolidated Manufacturing Company, acted as referee.

A COMBINATION MEET.

WASHINGTON, D. C.—Two motorcycle events were featured in the automobile meet at Laurel, Md., June 28, at which Bob Burman lowered two automobile records for the State of Maryland. The first of the motorcycle events, three miles, open, for 30.50 machines, was won by Fred Tiemeyer, Indian, with Thomas Dedge, Indian, second, and Clayton Sandruck, Excelsior, third. Time, 3:39. The second event, five miles, open, 61.00 machines, went to Fred Tiemeyer, on an Indian; Clayton Sandruck, Merkel, was second, and Alvin Day, Indian, third. Time, 5:27.

WITH THE COMET SQUAD AT BRIGHTON

Johnnie Albright, the Shooting Star from Denver, showing the way in a hair-raising sprint on the new three-lap bowl at Brighton Beach.

OLYMPIC WINNER.

ALFRED LANE, of New York City, amateur champion pistol and revolver shot of America and holder of a number of international championships, is an ardent motorcyclist. He has been riding two-wheelers for over eight years, and this summer missed his usual tour of three weeks through the Adirondacks and Maine woods. The reason why his pet mount, an 8 h. M. M. twin, is stored away at present is that Lane is in Stockholm on the American pistol team, where he recently made the highest scores in the Olympic revolver and pistol championship matches.

REFUSE A SANCTION.

AT the first meeting of the members of the Competition Committee of the Canadian Motorcyclists' Association, held at Toronto on Saturday, July 6, it was decided to refuse a sanction for motorcycle races in Montreal on August 10-11. The applicant, R. M. Jaffray, is a private promoter, and the association intends to give the preference to real club competition.

F. A. O. Johnston, president of the Toronto M. C., was unanimously selected as chairman of the committee for the ensuing term.

SAVED LIFE OF TOT.

ANOTHER life has been saved by the efficiency and speed of the trusty motorcycle. Little Dorothy Bilton, a three-year-old tot, accidentally fell into a boiler of boiling water at her home at 20 Huron street, Toronto, and was frightfully scalded. Her father, who is a member of the Toronto Motorcycle Club, picked her up and, mounting his Flying Merkel motorcycle, rushed her to the Sick Children's Hospital with all speed, where she received immediate medical attention.

A JINX AT TORONTO

Rain, Breakdowns and Spills Worry Promoters and Riders at a Well-Attended Race Meet.

TORONTO, CAN.—A jinx of dire hue was very much in evidence at the second big race meet of the season, staged by the Toronto Motorcycle Club at the Exhibition half-mile dirt track on Saturday, July 6. To begin with, a terrific thunder storm spoiled a motorcycle parade which had been planned for the night before the meet. At the meet itself, the green-eyed fiend bore down upon a number of the riders, watching Joe Baribeau, the new Canadian champion, with particular care, causing punctures, mechanical trouble and the like, finally bringing about a big spill in the last event, in which practically the whole race went down in a heap.

Competition of the hall-marked variety was provided for the 2,000 spectators, however, and the unfortunate features only served to intensify the interest, if that were possible. A great array of talent was on hand for the occasion, and honors were fairly distributed, although the hard luck which followed Baribeau prevented him from securing more than a lone second prize. In two races, the Winnipeg blew tires; in a third, he broke his magneto control and he was unable to finish at all in his fourth start on account of a skid.

Shorty Matthews, with his single cylinder white Thor, carried off two good wins and registered second place behind Cole in a third race. Cole cracked his single cylinder Excelsior racing machine in practice before the meet and was unable to start except in the twin-cylinder contests, both of which he won easily. Cole never rode better in his life, his work on

the corners being of the gilt-edge variety. He never skidded an inch and performed like a master. He was blamed by a few for the tumble in the last race, but the judge at the corner where the accident took place, freed him from all blame.

In the ten-mile single cylinder open event, Baribeau and Matthews, the Chicago crack, were fighting it out, when Baribeau took three spectacular skids, blowing his tire. It was then quick work for Matthews to come home. The Canadian champion and Cole began to fight it out in the ten-mile open race when Baribeau again sprung a leak and had to quit. In the unknown distance race, which turned out to be a ten-mile affair, Baribeau was dueling it with Matthews when his machinery went wrong and he became a trailer. Then in the twenty-mile contest, three of the riders spilled on the first turn but no one was seriously hurt. The race was stopped and a change was made to a five-mile event, which Cole captured easily, with Baribeau out of it.

Among the features of the occasion was Amoss' victory in the side-car race, in which he came from fourth position and won out in a sensational stretch drive. Amoss piloted a Rudge-Whitworth. This race provided great amusement for the crowd. A fine race was also provided in the ten-mile chain drive event for private owners. Scott ran away with first place, but Phillips on a 2½ Indian and Miles on a 4 h. Indian, fought on even terms for mile after mile for second place, Phillips, who is only a boy, finally outdistancing his rival, Newport, on a Triumph, suffered his first defeat of the season when Scott took his measure.

Summaries:

Ten miles, 30.50 class, belt, private owners' stock. — Won by N. Newport, Triumph; second, P. Barnes, Triumph; third, A. F. Astley, Triumph. Time, 13:58½.

Ten miles, single cylinder, open.—Won by Shorty Matthews, Thor; second, R. Barton, R. W.; third, G. Magee, Indian. Time, 12:18 4/5.

Ten miles, 30.50 class, chain, private owners' stock.—R. D. Scott, Indian; second, W. Phillips, Indian; third, F. W. Miles, Indian. Time, 14:02.

Ten miles, 55 cu. in. class, open.—Won by Harold Cole, Excelsior; second, Charlie Orr, Indian; third, R. Barton, R. H. Time, 12:16 3/5.

Five-mile side-car race.—Won by M. E. Amoss, Rudge-Whitworth; second, Percy Barnes, Triumph; third, A. F. Astley, Triumph. Time, 8:49.

Unknown distance race (ten miles).—Won by Shorty Matthews, Thor; second, Joe Baribeau, Indian; third, R. Barton, R. H. Time, 12:30 3/5.

Ten miles, 30.50 class, private owners' stock, T. T. models allowed.—Won by R. D. Scott, Indian; second, N. Newport, Triumph; third, A. F. Astley, Triumph. Time, 13:45 1/5.

Consolation race, five miles, 30.50 class.—Won by Charlie Orr, Indian; second, Walter Andrews, Indian; third, A. A. ussell, R. W. Time, 6:53.

Five miles open.—Won by Harold Cole, Excelsior; second, Shorty Matthews, Thor; third, R. Barton, R. W. Time, 6:17 3/4.

SMILEY A HUMAN COMET

With Machine in Flames, He Whirls Around Cleveland Track at Eighty Miles an Hour.

CLEVELAND, Ohio.—A feature unannounced beforehand was added to the program of thrilling and close motorcycle races at the Stadium tonight, when Russell Smiley whirled around the saucer track at an 80-mile an hour clip in flames. A broken gasoline feed pipe caused him to leave a trail of flaming gasoline in the wake of his machine. He came to a stop by turning his machine off the track into the sand, and the blaze was put out by the use of chemical extinguishers. Smiley was not burned, al-

though his machine was put out of commission. Standen made a run-away of the match race between himself and Huttering, the latter's machine not working right. Knapp won the three-mile invitation professional race, but not until after a seesawing affair with Gibson for twelve laps. Summaries:

Three miles, amateur.—Roehl, first; Henikman, second; Norton, third. Time, 2:48.

Two-mile professional match race.—First heat, won by Standen; Huttering, second; time, 1:35. Second heat, won by Standen; Huttering, second; time, 1:30 3/4.

Three-mile invitation, professional.—Won by Knapp; Gibson, second; Seliga, third. Time, 2:13 3/4.

Eight-mile, free-for-all.—First heat, won by Smiley; Gibson, second; Seliga, third; time, 1:30 3/4. Second heat, won by Knapp; Standen, second; Huttering, third; time, 1:30 3/4. Final heat, won by Gibson; Knapp, second; Smiley, third; time, 6:02.

BRIGHTON PROGRAMS DRAW BIG CROWDS

Albright, Chapple, Cox, Klebes and Constant Supply Thrills on New Bowl and a Few Falls Enliven the Speed Sessions—Sensational Riding in a Heavy Fog.

BROOKLYN, N. Y., July 8.—The riders at the new Brighton Motordrome took big chances on Sunday evening. A heavy fog rolled in from the ocean, blanketing the track and making the riders almost indistinguishable at one hundred yards. Like gaunt shadows, with fire spitting from the engines, the riders would suddenly loom up out of the mist and in an instant they would be swallowed up in the fog on the backstretch.

Arthur Chapple and Johnnie Cox featured in their respective races. Chapple won his match race with H. H. Thomas, of Philadelphia, in straight heats. Cox, on his J. A. P. machine, romped home an easy winner in the first heat of the five-mile professional race. In the second heat the oil pipe connection to the front cylinder broke and he finished third. In the final heat, Billy Wray borrowed John Constant's machine and Cox used Wray's motor. Much to Wray's surprise Cox beat him out very handily. This race was cut to three miles due to the heavy fog.

Charlie Davis had a sensational spill on the eleventh lap of the professional race. Riding low, his pedal caught on the boards and he was thrown, sliding a distance of a hundred feet before he stopped. Neither rider or machine were injured.

The track was very wet and slippery and goggles were useless as they "fogged," making it difficult for the riders to see.

Sunday night's summaries: Mile time trial, by John U. Constant. Time, 46 seconds.

Three-mile time trial, by Arthur Chapple. Time, 2:06 3/4.

Five-mile professional race.—First heat won by John Cox, J.A.P.; second, Wm. Wray; Indian; third, Chas. Davis, Indian (out on 11th lap). Second heat won by W. Wray, Indian; second, Chas. Davis, Indian; third, John Cox, J.A.P. Time, 4:00 3/4. Final heat (distance cut to three miles), won by John Cox, Indian; second, Chas. Davis, Indian; third, W. Wray, Indian. Time, 2:19.

Five-mile match race between Chapple and H. H. Thomas.—First heat won by Chapple, Indian; time, 2:14 3/4. Second heat won by Chapple, Indian; time, 2:14 3/4.

Handicap professional three-mile race, won by John Cox, Indian (scratch); second Wm. Wray, Indian (200 yards); third, Chas. Davis, Indian (200 yards).

BROOKLYN, N. Y., July 8.—Saturday's racing at the Brighton Motordrome was productive of a series of spills and some sensational riding. In the exhibition races of the matinee performances, Johnnie Constant blew a front tire while racing around the backstretch. He was thrown headlong over the machine and received many bruises. Johnny Albright, the Denver flier, also blew a tire,

but was able to control his machine and escape injury. In the deciding heat of the four-mile amateur race of the evening, J. French in attempting to climb the track fell and rolled to the bottom and Constant, who was close behind French when he fell, leaped from his machine as he was about to crash into French's mount. Both riders escaped with a few scratches, but the machines were put out of commission and the race was declared off.

In the championship five-mile races Johnny Albright defeated "Speedy" Vanderbery, of Philadelphia, in straight heats. In the second heat, the oil supply in Vanderbery's machine ran low and he was forced to quit in the fourth mile. The five-mile professional race furnished the closest finish yet seen on this track. In the first heat Chas. Davis and John Cox were so close together it was almost impossible to determine the winner. Davis was awarded the race, the judges stating that he was inches ahead. In the second heat Cox made sure of winning by riding four laps too far. In the final heat Wm. Wray had a miraculous escape from serious injury. In the fourth mile, while nearing the grandstand, he was seen to swerve against Davis, just grazing that rider's machine. His handle bar had cracked close up to the steering head and he had difficulty in controlling his machine. He finished the heat with one hand on the bar.

Saturday night's summaries: Special amateur four-mile handicap race.—First heat, won by J. French, Indian (2 laps); second, John Constant, Indian (scratch); time, 3:11 3/4. Second heat, won by John Constant, Indian; second, J. French, Indian; time, 3:06 3/4. Third heat, French fell and race was declared off.

One-mile time trial by Johnnie Albright, Denver; time, 43 3/4 seconds.

Five mile professional race.—First heat, won by Chas. Davis, Indian; second, John Cox, J.A.P.; third, W. Wray, Indian; time, 3:54 3/4. Second heat, won by John Cox, J.A.P.; second, Chas. Davis, Indian; third, W. Wray, Indian; time, 3:50. Final heat, won by John Cox, J.A.P.; second, Chas. Davis, Indian; third, W. Wray, Indian; time, 3:44 3/4.

Five-mile match race between Johnnie Albright and Wm. Vanderbery.—First heat, won by Albright; time, 3:46 3/4. Second heat, won by Albright; time, 3:45 3/4.

Five-mile professional handicap race.—Won by Wm. Wray, Indian (1 lap); second, John Cox, J.A.P. (scratch). Time, 3:58 3/4.

SATURDAY, June 29.—At the inauguration meet of the Brighton Stadium, at Brighton Beach, New Yorkers witnessed their first motorcycle speed exhibitions on a board track. All the crack riders of the East and Johnnie Albright, the Denver flier, participated in the events of the evening.

From the crack of the pistol in the first event to the final number on the program, the great crowd of spectators was treated to a series of thrills.

Summaries: Amateur, four miles.—First heat, Frank Zimmerman in lead; Lyons fell; race called off. Second heat, won by John Constant; second, Billy Annis; time, 3:45 3/4. Final heat, won by John Constant; second, Frank Zimmerman; time, 3:48 3/4.

Professional, five miles.—First heat, won by John Cox; second, Billy Wray; time, 4:06 3/4. Second heat, won by Charlie Davis; second, Ferdie Mercier; time, 4:20 3/4. Final heat, won by John Cox; second, Billy Wray; time, 4:07.

Professional championship, match series, at three miles.—First heat, won by Arthur Chapple; time, 2:12 3/4. Second heat, won by Johnnie Albright; time, 2:06 3/4. Final, won by Arthur Chapple; time, 2:36 3/4.

Handicap professional race at four miles.—Scratch, John Cox; 15 yards, Ferdie Mercier; 20 yards, Charlie Davis; 1 lap, Billy Wray. Won by Mercier; second, Davis. Time, 3:26 3/4.

Two-mile time trial by Johnnie Albright; 1:21 1/4.

One-mile time trial by Arthur Chapple; 41 seconds.

All the men rode Indian machines with the exception of Cox, who rode a Baxter J. A. P. machine.

BROOKLYN, N. Y.—Johnnie Albright, the Denver flier, continued his sensational riding at Brighton Stadium Motordrome on Sunday, June 30, by winning from Harry Klebes, of Philadelphia, in the three-mile professional championship race series. In the first heat the men traveled over the greater part of the distance abreast of each other, Albright finally gaining a machine length and crossing the finish line in 2:19 3/4. In the second heat Klebes set out to show his heels to Albright, but the Denver boy was too swift for him. Albright won by a comfortable margin.

The final heat of the professional five-mile race proved the most exciting one of the evening. Davis, Mercier and Cox qualified. Mercier led at the start, with Cox a close second, Davis gradually falling behind. At the end of the fourth mile Mercier and Cox were abreast with Davis, three quarters of a lap in the rear.

All the interest in the race was centered on Mercier and Cox, Mercier riding a 7 h. Indian and Cox a British J. A. P. machine. Davis was considered out of the running when suddenly he was seen to speed up and in a sensational sprint he gradually cut down the distance between himself and the other two riders. As the flag for the last lap was dropped he suddenly shot up to the top of the track and passed Cox. In the last 200 yards he caught Mercier and won with yards to spare.

The Real Test Of Tires

The real test of tires is not on the race-track—it is made on the open road where average conditions prevail.

Track and road conditions are entirely different. Tires that are built for speed and speed alone will not stand up under the gurell-

ing grind of the rough and rock-strewn road.

They are designed to be used under ideal conditions—conditions that will not be found even on our finest boulevards! When subjected to the real test they will not stand up.

They can't—they are not built for it.

The Tire Built For Road Results

Diamond Motorcycle tires are built for road results—greatest mileage. Our engineers have analyzed every road condition. Every stress and strain to which a tire is subjected has been met.

Diamond Engineers have at their command all the knowledge gained in 14 years of tire building and rubber compounding. They are the most efficient corp in the world.

It was they who designed and built the first pneumatic tire made in America for motor driven vehicles. That they built well is attested by the fact that today these tires are the largest selling single brand of tires in the world!

But it has not been these men alone—not the knowledge gained by the few—that has made Diamond tires supreme. Ten thousand actual users have loaned their

knowledge. Every problem they encountered they told us of and offered a solution.

With this vast store of facts gathered from every section of the country during a period of 14 years, at their command, our engineers designed Diamond Motorcycle tires.

Endurance was not sacrificed for resiliency, or either for speed. The maximum of each was their aim.

For endurance—ability to stand up and deliver the mileage under the severest conditions—these tires have no equal. Ask for them. Insist on having them. They cost no more than weaker tires.

Made in two treads, studded and corrugated—but only one quality. In single clinch only and all sizes to fit the 26 inch and 28 inch rims, including the 29" x 3".

Send For Our Motorcycle Book. It's Worth Having

*We could build them cheaper—But we won't
We would build them better—But we can't*

ON NEW COLUMBUS BOWL

Records Fall When Seymour and Hasha Star at Opening Meets on July Fourth.

COLUMBUS, Ohio.—More than 27,000 fans attended the race meets held July 4 on the new board track. Records were smashed in almost every event, and the track is pronounced the fastest in the world. Not a serious accident marred the events of the afternoon and evening.

Records were lowered by Raymond Seymour, of Los Angeles, and Eddie Hasha, of Dallas, Tex., both of whom rode Indians. In the speed trials made at the close of the regular program in the afternoon both these riders made records of $37\frac{1}{2}$ seconds for the mile, which is the world's record by $\frac{1}{2}$ of a second. Other records lowered were for three miles, four miles and five miles. The marks made at these distances were 1:59 for three miles; 2:33 for four miles, and 3:12 $\frac{1}{2}$ for five miles. The last record was made at the night races.

The liveliest event of the two meets was the match race between Hasha and Seymour, best two in three, at three, four and five miles. Seymour won the first heat in 1:59, while Hasha took the second heat in 2:33. The third heat resulted in a victory for Seymour in 3:13.

The challenge cup championship race for members of the Columbus Motorcycle Club resulted in a victory for George E. Evans, Indian. He covered the five miles in 3:52 $\frac{1}{2}$. L. P. Birkenbach, who had won the cup on the dirt track in the two previous years is compelled to relinquish it to Evans. Summaries:

AFTERNOON MEET.

Five miles, for private owners, 30.50 cu. in.—Don Klark (Indian), first; L. P. Birkenbach (Thor), second; George E. Evans (Indian), third. Time, 4:31 $\frac{1}{2}$.

Five-mile novice, open—J. A. Yates (Indian), first; Joseph Miller (Indian), second; Charles Barker (Thor), third. Time, 4:25.

Match race between Seymour and Hasha; two in three heats; three, four and five miles—First heat, Seymour, 1:59; second heat, Hasha, 2:33; third heat, Seymour, 3:13.

Five miles, 61.00 cu. in.; Columbus M. C. Championship Cup—George E. Evans (Indian), first; L. P. Birkenbach (Indian), second; J. A. Yates (Indian), third. Time, 3:52 $\frac{1}{2}$.

Seven miles, open, 61.00 cu. in.—Don Klark (Indian), first; L. P. Birkenbach (Indian), second; George E. Evans (Indian), third. Time, 5:27 $\frac{1}{2}$.

Five miles, stripped stock, private owners and resident club members, for motordrome challenge cup—H. D. Wooley (Indian), first; J. A. Yates (Indian), second; Charles Barker (Indian), third. Time, 4:23.

Ten-mile professional, open—Don Klark (Indian), first; L. P. Birkenbach (Indian), second; Walter Kussemul (Indian), third. Time, 7:43 $\frac{1}{2}$.

Time trials—Raymond Seymour, one mile in 37 $\frac{1}{2}$; Eddie Hasha, one mile in 37 $\frac{1}{2}$.

EVENING MEET.

Five-mile novice, stock, 30.50 cu. in.—J. A. Yates (Indian), first; Joseph Miller (Indian), second; Charles Barker (Indian), third. Time, 4:17 $\frac{1}{2}$.

Six miles, open, 61.00 cu. in.—Don Klark (Indian), first; L. P. Birkenbach (Indian), second. Time, 4:49.

Five miles, open, 30.50 cu. in.—Don Klark (Indian), first; L. P. Birkenbach (Thor), second. Time, 4:58 $\frac{1}{2}$.

Five miles, stripped stock, 61.00 cu. in., private owners—J. A. Yates (Indian), first; Joseph Miller (Indian), second; Charles Barker (Indian), third. Time, 4:23 $\frac{1}{2}$.

Ten miles, open, 61.00 cu. in.—Don Klark (Indian), first; L. P. Birkenbach (Indian), second; B. B. Dougherman (Indian), third. Time, 7:39.

Five miles, free-for-all—Ray Seymour (Indian), first; Eddie Hasha (Indian), second. Time, 3:12 $\frac{1}{2}$. Average time, 96 miles per hour.

SHAFFER STAR OF MEDINA MEET.

RACES held at Medina, Ohio, in connection with the fair on July 4, attracted a crowd estimated at 12,000. "Bill" Shaffer, of Cleveland, was the big attraction on his Indian, while E. H. Tracy, another Cleveland speedster, gave Shaffer a hard ride in nearly every event, beating the former in the ten mile for singles. Summaries:

Five miles, 30.50, stock.—First, Shaffer, Indian; second, Tracy, Indian. Time 7:43 $\frac{1}{2}$.

Three miles, novice, for 30.50, stock.—First, Gaupard, Indian; second, Schloz, Indian. Time, 5:11.

Ten miles, 30.50 class.—First, Tracy, Indian; second, Schaffer, Indian. Time 15:13 $\frac{1}{2}$.

Five miles, 30.50, stock.—First, Schaffer, Indian; second, Tracy, Indian. Time 7:49 $\frac{1}{2}$.

A RECORD DENT.

WHILE reeling off about 90 miles an hour recently on the Riverview Motordrome in Chicago, Joe Wolters had a sensational spill which left his rear wheel in the condition

shown in the photograph. Joe was not injured, but it goes without saying that the wheel found its way to the junk pile. The tire remained on the rim and was not punctured.

PROTEST AT SAVANNAH.

SAVANNAH, GA.—Over 2,000 fans witnessed the races held under the auspices of the Savannah M. C. on July 4. The first event of the day was for singles. A battery Thor made the two laps of six and a half miles in 16:39, or at the rate of 46 miles an hour, and Steve Harris, Indian agent in Savannah, protested the race. The engine was taken down later and found to be a stock model. Summaries:

Event No. 1, for singles—First, George Cleary (Thor); time, 16:39; second, Hopkins (Indian), 17:03; third, Potts (Merkel), 19:24.

Event No. 2, for twins—First, J. E. Hodge; time, 21:24; second, Mosher (Indian), 21:26.

Event No. 3, for twins—First, John Mosher; time, 23:24; second, Cleary (Thor), 23:59; third, Downing (Merkel), 26:10.

Event No. 4—First, Mosher (Indian); time, 23:27; second, Cleary (Thor); third, Cafiero (Harley-Davidson).

Event No. 5, twins—First, J. E. Hodge; time, 22:20; second, Mott (Excelsior), 30:49.

CLUB HONORS DERKUM.

PAUL J. C. DERKUM, the manager of the Vailsburgh Stadium Motordrome, has been elected an honorary member of the New Jersey Motorcycle Club, of Newark.

ELMIRA SPEED SESSION.

Two Rochester Boys, Bishop and Van Amkirk, Carry off Bulk of Prizes in Big Holiday Meet.

ELMIRA, N. Y.—The main contenders in the Elmira Motorcycle Club's Fourth of July race meet were R. J. Bishop and Ed. Van Amkirk, both of Rochester. Bishop took first in all the main events except one, and in that event he was disqualified for looking over his shoulder to ascertain the position of his competitors. Teasdale, of Elmira, had hard luck all through the races, having two blowouts, one occurring when he was putting up the prettiest race of the day. Peters, of Elmira, while riding in the sixth event, fouled Teasdale, and his race was protested. The summaries:

Event No. 1, three-mile novice, 30.50 cu. in., stripped stock—First, Harry Burgess, Elmira; second, T. Sayles, Elmira; third, W. Mahoney. Time, 5:02.

Event No. 2, ten-mile open, 50.00 cu. in., stripped stock—First, R. J. Bishop, Rochester; second, Charles Teasdale, Elmira; third, Leon Peters, Elmira. Time, 13:46 $\frac{1}{2}$.

Event No. 3, five-mile, private owner, 30.50 cu. in., stripped stock—First, R. J. Bishop, Rochester; second, Edward Van Amkirk, Rochester; third, Charles Teasdale, Elmira. Time, 9:02 $\frac{1}{2}$.

Event No. 4, ten-mile open, miss and out, 50.00 cu. in., stripped stock—Edward Van Amkirk, Rochester, finished alone; R. J. Bishop was disqualified for looking back over his shoulder, and Teasdale, of Elmira, had a tire blow out. Time, 14:41.

Event No. 5, five-mile open, 30.50 cu. in., stripped stock—First, R. J. Bishop, Rochester; second, Edward Van Amkirk, Rochester; third, Charles Teasdale, Elmira.

Event No. 6, ten-mile, private owner, 50.00 cu. in., stripped stock—First, R. J. Bishop, Rochester; second, Peters, Elmira. Time, 14:21 $\frac{1}{2}$. Bishop entered this race under protest as his machine was not a stock model.

Event No. 7, unlimited time, open event, 30.50 cu. in., stripped stock—First, Bishop, Rochester; second, Charles Teasdale, Elmira; third, Edward Van Amkirk, Rochester. Time 7:59 $\frac{1}{2}$.

SURPRISES AT DENVER.

DENVER, COL.—Surprises were the order of the day in the motorcycle races at Tuileries Park on Sunday afternoon July 7. The first came when Ed. Swartz defeated Curly Fredericks in a match race and there was another when Cox slipped past the other riders on the homestretch of the seven-mile open event and won by less than a foot. Cox, by getting two firsts, carried off the honors of the day. In each event, however, he had only inches to spare.

Curley Fredericks was beaten by Swartz in the last fifty feet, due to the breaking of his spark control. Swartz hung on to Fredericks' rear wheel the entire distance and had just jumped out of the pace in the last lap when Fredericks tried to give his machine the rest of the spark, only to find that the control had broken. The match race between Cox and King was the prettiest race of the day with the riders sticking almost elbow to elbow during the entire race. Summaries:

Two miles, amateur, singles, stock, 30.50 class—L. Parkhurst (Merkel); R. Barclay (Merkel). Time, 2:28.

Three miles, open, professional, 61 class—E. Swartz (Indian); M. Fredericks (Excelsior). Time, 2:17 $\frac{1}{2}$.

Match race, 3 miles, professional, 61 class—J. Cox, (Merkel); F. King (Indian). Time, 2:17.

Seven miles, open, professional, 61 class—J. Cox (Merkel); A. Patterson (Merkel); L. Bowen (Merkel). Time, 5:04 $\frac{1}{2}$.

YALE SIDE-CAR CLUB.

THE Yale Side-Car Club has been organized in New York City with the following members: Arthur E. Fisk, John Siemsen, O. W. Fuller, J. O'Brien, Louis Goldsmith and J. Godfrey Haas. Headquarters have been taken at 94 St. Nicholas avenue, New York.

JERSEY'S FIRST SPEED BOWL

An Exciting Finish on Newark Track, Opened on July 4, and a View of the Crowd that Turned Out to Cheer the Daring Record-Chasers.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10. Total, \$100

THE announcement, made in the June 27 issue of MOTORCYCLE ILLUSTRATED, that this journal would award four cash prizes aggregating \$100, in an Improvement Contest, has set hundreds to cudgelling their brains for prize-winning ideas. Upwards of twenty suggestions have already been received, and almost every mail brings in a new one. The first series of proposals will be published in the next issue. For the benefit of those who may not have read the original announcement, the object and the conditions of the contest are reprinted, as follows:

Four cash prizes of \$50, \$25, \$15 and \$10 respectively, totaling one hundred dollars, will be awarded to those who propose the best four suggestions for the improvement of the present-day motorcycle. And in this connection it should be stated that our readers, no matter how gifted with mechanical ingenuity, should not attempt to design entire machines, but rather devote their efforts to the perfection of important details. This is not to say that new designs of motorcycles in their entirety are not wanted; on the contrary they will be welcomed by the editor of this contest. But to design a new machine that will be a distinct improvement upon any on the market today is sure to be a herculean task and, in any event, only the product of years of thought and steady application on the part of a mechanical genius. Still, it is not at all impossible that a contest of this character may bring out such a man and such an idea.

It is probable, however, that the prize-winning suggestions will have to do with details overlooked by the clever designers who make it their business to perfect the motorcycle. Therefore, it behooves every reader of MOTORCYCLE ILLUSTRATED to consider and analyze his own machine, and machines in general, from that point of view. Moreover, though the test of mechanical perfection will be applied to every suggestion received, on the other hand, liberal credit will be given for ideas in the rough, and their value will be measured on the following basis:

First of all comes the question, To what extent is this necessary? Then the three considerations of comfort, safety and convenience; then adaptability to different machines or their parts or accessories; mechanical perfection;

reliability; cost of manufacture; durability; simplicity, and neatness. In measuring the total value of each idea or design, one hundred points will be the mark of perfection, and the scoring will be done as follows:

Necessity and desirability.....	25 points
Safety, comfort and convenience..	15 points
Adaptability	10 points
Mechanical perfection.....	10 points
Reliability	10 points
Manufacturing cost.....	10 points
Durability	8 points
Simplicity	7 points
Neatness	5 points

Total 100 points

The terms "simplicity" and "neatness" do not refer to the form of the drawings or descriptions representing the ideas themselves, but to the finished result as applied to a motorcycle. In other words, competitors need not be draughtsmen. On the contrary, although drawings should be submitted whenever they help to make the idea clear, still such a sketch need only indicate roughly the idea it is intended to convey. Our staff artists will not only work out in finished form all rough drawings, but also make new drawings for accurately described designs.

Cash prizes will be awarded as follows:

First Prize.....	\$50
Second Prize.....	\$25
Third Prize.....	\$15
Fourth Prize.....	\$10

Total\$100

In addition to awarding these prizes, MOTORCYCLE ILLUSTRATED will pay at least \$1 for every suggestion published, immediately after it appears. Those who do not want their names published may contribute anonymously, but should an anonymously contributed suggestion prove to be one of the best four, the name of the proposer will have to be published in order to make him eligible for a prize.

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.

6. The prize winners will be determined on the point system as outlined above by the editors of MOTORCYCLE ILLUSTRATED who, in making their announcements, will give the detailed scores of at least the best twelve suggestions.

7. At least one dollar will be paid for every suggestion published.

8. Competitors are requested to address all their communications to Editor Improvement Contest, MOTORCYCLE ILLUSTRATED, 51 Chambers street, New York City.

ENGLISH NOTES

BY BRITISHER

Float Feed or "Injector" Type Carbureter? Valve Troubles on Racing Machines.

A FIERCE battle is now raging in the British market between representatives of the old type of float-feed carbureter and a legion of novelties embodying what is called the "injector" principle. The injector carbureters work on roughly the same lines as a barber's scentspray, and the motive underlying their design is to abolish fine adjustments of gasoline level and jet aperture, and to secure a more homogeneous atomization of the spirit. With the old type of carbureter the direction of the piston suction operated parallel to the axis of a vertical jet; with the new type the direction of suction is at right angles to jet axis. Friction of the gases is uniformly abolished with the new carbureters when both throttle and air-valves are fully opened, and on all the new types there is a clean straight-through run from the open atmosphere to the inlet valve; the basic principle is shown in Fig. 1.

It is obvious that with a carbureter constructed on these simple lines the level of the gasoline is negligible; the suck of the fierce rush of air across the top of the jet yanks out the spirit, even if its surface be

located at the very foot of the jet tube; for similar reasons the diameter of the jet is of small import, and a .040 jet is the standard for all engines of $3\frac{1}{2}$ h. p. The most refined carbureter on these lines is known as the Senspray, of which a section is given in Fig. 2. The fixed air is inhaled through a tapered cone funnel opening right on the jet, and at right angles to it. This tapered cone is surrounded by an auxiliary air valve, roughly corresponding to the iris diaphragm stop of a kodak, or to the sliding vane ventilator of a street car. When the engine is once started this auxiliary air valve can be immediately flung wide open, and the engine driven all day long on the throttle control alone; the piston suction automatically provides the right proportions of air and gasoline vapor, while the taper cone suck mixes them very thoroughly. With a .040 jet I find the gasoline consumption varies according to the power taken out of the engine. I can run my racer on the road at ordinary touring speeds, and at the end of a long day's run register a consumption not exceeding 120 miles to the gallon; I can take the machine onto the track without altering a single adjustment, and roar round at 65 m. p. h., when the consumption rises to racing fig-

their valves are well made, they work admirably for all needs, with a minimum consumption of gasoline, and without demanding any close adjustments at all.

Valve Troubles on Racers.

THE blue ribbon of British track racing is the hour record on Brookland's track under the 500 cc. limitation; the figures now stand at 63 odd miles in the hour, and the holders are growing nervous, as a fortnight ago a 350 cc. horizontally-opposed twin-cylinder Douglas cheekily covered $56\frac{1}{2}$ miles inside 60 minutes. The main trouble with the $3\frac{1}{2}$ h. is to find an exhaust valve which will give decent compression towards the end of so fierce a spin. Cast-iron valves wear well so far as their working faces are concerned, but they are very apt to break and the heads sometimes "fly" and wreck an engine, while the stems pull out and stretch. Nickel steels of various alloys are free from fear of fracture, but with a 60-pound spring returning them whack on their seat 750 times a minute,

The Senspray Carbureter.

ures, 70, 60, or even 50 miles per gallon of fuel. I can find no criticism to pass on the principle of these carbureters in actual road work, provided they are well made; there is nothing to adjust, and they do not ask to be tickled when you wish to effect a start. Some of them have leaky throttle valves, in which case slow running in city traffic is not easily achieved; but provided

they pit badly, and often hammer the cast-iron seat out of true.

Practically all the firms which support racing regard the valve as the key to the

record. They have now learned all they can unearth about lubrication, about light steel pistons which resemble the Irishman's famous coat in being "a lot of holes neatly patched together"; about special cams, and special timings; and they are concentrating on the valve problem. Some of these firms have got just a single exhaust valve apiece, which lasts better than any other, and when one of their team turns out at any sprint event, the chaff is "Have you got the valve?" One firm uses a two-piece valve with nickel steel stem and cast-iron head, carefully hardened all over by a secret process; another uses a nickel steel valve, with a cast-iron ring spun onto the stem for the seat, and so forth. Another firm, which uses an overhead inlet valve, has swapped its valves round, and is placing the inlet beneath and the exhaust on top, so as to give the stressed exhaust valve the benefits of maximum draught for its spring and stem.

Foot-Operated Oil-Pumps.

ONE tip to be seen on the Tourist Trophy racers is the foot control of the oil-pump. A pedal on the footrest is used to fill the pump by means of a flexible Bowden wire, and a strong spring gradually discharges the contents into the engine, thus leaving the rider's hands permanently on the steering bar. Query—how will he slush his engine if a tumble deranges his footbar? In some cases the front brake has been eliminated. A powerful front brake is known to be perilous when rounding a corner, and in emergencies the frenzied jockey sometimes forgets his caution, and smashes on a very powerful front rim. So some machines are fitted with two belt rims, one on each side of the rear wheel, and both are provided with huge brake shoes and pedals. Nevertheless two brakes on one wheel can never be as efficient as one brake on each of two wheels; in the last resource the ground takes the brake-strains, and it is the amount of arrested contact area with the road that counts. We would rather have both wheels braked, and keep our head.

NEW MOSLER FACTORY

A. R. MOSLER & CO., manufacturers of the well-known Mosler line of ignition specialties, including the famous "Spit-Fire" spark plug, have moved from their office at 123 West Twenty-ninth street, New York City, to their new and modern factory, situated on the Bronx river near the Wakefield station of the New York Central railroad's Harlem division. The company has purchased two acres on which a two-story factory has been built. It measures 100 x 200 feet and is of model construction. The window area is unusually large and a skylight 20 feet wide runs the entire length of the building, giving more light than is generally found in a manufacturing plant. The factory is heated by steam and the power is supplied by a large two-cylinder gas engine. There are 500 electric lights in the building, the current for which is generated on the premises. The location is quite accessible, being only 40 minutes from the Grand Central station, or it can be reached by the Third Avenue elevated, connecting with the West Mount Vernon car. A. R. Mosler & Co. make a well-known line of ignition specialties, including the world-famous "Spit-Fire" spark plug.

SEVERE TRIALS FOR ENGLISH RIDERS

Contestants in Six-Day Grind Will be Penalized for Slightest Faults—Regulations and Timing System.

THE preliminary regulations for the August six days' trial are now published, and they make it plain that gold medals are not going to be given away with half a pint of gasoline. Indeed, if the weather is bad, and the ill-famed Devon and Somerset "zline" (as the yokels call it) smears the road with its treacherous film, the riders who emerge with perfect scores will be few and far between. It is possible that American roads—on which I have had no experience—are too bad to permit of similar rules being adopted on your side, but the rules will show how strenuously machines are tested on the fine highways we possess over here. The marking system is as follows. Each rider starts the trial with a capital of 1,000 marks; there are penalties for everything, from a barky silencer to a cut tire or "legging" round a hairpin bend on a steep hill. If you finish with 950 marks or over, gold medal; if with 950-850 marks, silver medal; if you complete the run within two hours of the official finish, and secure no other award, bronze medal.

Some of the Penalties.

Here are sketches of some of the penalties: Each day there are two official test hills; if you stop, pedal, or leg your machine on a test hill, bang go 50 marks. The timing schedule covers the *entire route*; it is not a question of being on time at advertised controls only. The complete 1,000 miles has been measured out by a calibrated speedometer, and distances are secretly marked at frequent intervals. At any of these known distance points, or at all of them, the watchholder may snick his chronometer on you. If you are ten minutes slow or fast on a 20-mile an hour basis at any point, you lose one mark per minute or part of a minute for your error; thus one hill failure, plus being 11 minutes out on time, will smash your chance of a premier award. Thus scrapping to catch up time after trouble is knocked on the head, and the whole 1,000 miles have to be ridden with one eye on the watch and the other on the speedometer dial; and both instruments must be accurate. As regards the hills, the route lies in the mountains of the west, and no single ascent is on a properly engineered or surface road; all the hills lie on crosslanes between main roads, where grading, cornering and surface are as crude as they can possibly be. Three of the known hills include grades worse than 30 degrees, and one of them begins at right angles out of a village, starts the ball with three wicked bends resembling a rectilinear corkscrew, has a surface like a torrent bed in the dry season, and keeps on climbing for four miles. On one day the route is a dead secret known to the secretary alone, and this has to be covered absolutely non-stop; it is supposed to contain the most virulent assortment of blind corners and sudden grades ever crowded into a morning jaunt, and is no less a test of the riders than of the machines. Other non-stop sections are also included, and the idea is to prevent riders waiting at the foot of bad hills to cool their engines, shorten belts and lower gears.

The sole time available for repairs and adjustments is cut down to 15 minutes per morning, and as tanks have to be filled in this period, and there will only be a couple of boys with one gasoline funnel and one measuring can, there won't be much surplus for tuning up carbureters. The list of spare parts to be carried is sternly specified, and is limited to tire outfit, spare plugs, one complete valve, belt and fasteners, or chain and links; magneto case, one cover, any number of tubes, control wires, nuts and washers. All outer covers will be marked at the start, and five marks will be deducted for each change of a cover; there is no penalty for changing tubes in running time, apart from any time losses so incurred. Tires may be repaired in control at night under observation, at a penalty of five marks a time. The riders will be secretly timed over short sections scattered over the route, and any rider exceeding 20 miles an hour will be penalized according to his pace. At the conclusion of the trial each machine will be closely inspected, and five marks deducted for each ascertained "demerit." Thus the conditions are so severe—taking the character of the route into consideration—that it may be impossible for any rider to finish with a perfect score, even in fine weather.

RODE IN OUTLAW MEET.

CHAIRMAN THORNLEY, of the F. A. M. competition committee, has received a report to the effect that William Marks, Milton Sammons, Albert Hanson, William Reese and two other riders, whose full names were not known, competed in an unsanctioned meet at Kansas City, Mo., on June 14, and he has accordingly issued a restriction against their competing in any F. A. M. sanctioned meet.

RODE TO HAGERSTOWN.

C. BILLARD, William J. Meyer, Raymond Padgett and Charles H. Grier, Indian enthusiasts of Washington, D. C., motored to Hagerstown, Md., on Saturday, July 6, returning on Sunday afternoon. This trip is a favorite one in this section as an attractive and historic country is traversed.

NEW COFFEYVILLE FIRM.

E. C. WILLIAMS, a well-known mechanic of Coffeyville, Kan., and Floyd Case, Excelsior representative in Coffeyville, have opened a first-class motorcycle garage. They have launched their business under the name of The Coffeyville Machine and Motorcycle Repair Company. Both members of the firm are boosters of the local club.

BOSCH IN T. T. RACES.

OF unusual interest to American manufacturers and riders is the announcement in the Tourist Trophy races just completed in England, that all the motorcycles to finish, in both classes, used Bosch magnetos.

ON NORTHERN TOUR.

BALTIMORE, Md.—Fred Wilkens and Julian Hecht left before the Fourth for a trip through New Jersey and Long Island, and managed to cover a great deal of ground in the short time they were away.

TO PURIFY GASOLINE.

AN ingenious device for filtering gasoline for motorcycle motors has been placed on the market by the National Sales Co., of 45 Milk street, Boston, Mass. It is called the Ellis Gasoline Purifier Junior, and its manufacturers assert that it will extract all water and sediment from the fuel supply before it reaches the carbureter, thus obviating the danger of clogging and disarranging that fitment. The device is made of aluminum composition and weighs about three ounces, including two brass unions of suitable size for making the connections. For fitting the purifier about three inches of clear space is required, preferably under the gasoline tank and on a line with the carbureter.

As the gasoline enters the precipitation chamber in the purifier it is filtered through two fine screens, felts and quartz, which catch all particles of dirt and paraffin. Any water in the fuel finds lodgment in the precipitation chamber and is held there as the gasoline rises and passes through the filters on its way to the carbureter. By turning a thumb screw the rider may release the accumulated water and sediment from the precipitation chamber at any time.

AN ECONOMICAL FUEL.

APURE hydrocarbon fuel, or gasoline freed from mineral oil, sulphur and the like is "Energine," the product of the Energine Refining & Manufacturing Co., 2005 Euclid avenue, Cleveland, Ohio. It is odorless, and non-carbonizing, and it is stated that by its use 37 per cent. more power is obtained with 27 per cent. less fuel. These figures are taken from tests made during March of this year by the United States government.

DEATH OF FISK OFFICIAL.

ANNOUNCEMENT is made by the Fisk Rubber Co., of Chicopee Falls, Mass., of the death of its treasurer, Alfred Nye Mayo. Mr. Mayo, who died on June 25, was widely known in trade circles.

FLANDERS AGENCY.

COLUMBUS, OHIO.—P. I. Haynes & Co., located at 45 North Third street, Columbus, has taken the local agency for the Flanders. The same company has the central Ohio agency for the Harley-Davidson.

NEW TANDEM AND A VALVE LIFTER.

TWO accessories which will appeal to the rider are being produced by the Simplex Machine Works, Forty-fifth street and Sixth avenue, Brooklyn, N. Y. They are a tandem

attachment of moderate price and simple construction, capable of adjustment to any machine, and a valve lifter, both of which are illustrated herewith. The tandem device consists of a well-padded cushion, designed to be attached to the luggage carrier by straps and stirrups or rests attached to the rear stays and forks by clips. The stirrups are made of strong steel flat stock and will support the heaviest rider over the roughest roads without becoming bent. The price of the cushion part is quoted at \$3.50, with the stirrups for \$2 additional, per set of two.

The valve lifter is of very simple construction. It consists of a bent piece forming the handle or grip, whose ends form the jaws that fit under the valve-spring cup or washer. To this handle is pivoted a block tapped for the reception of the threaded portion of a bar whose upper end is bent to fit in the valve chamber and hold the valve on its seat. An angle piece whose edge can be engaged with the threads on the bar is also pivoted to the handle. When the valve is to be removed the hooked end of the bar is placed on the valve and the jaws under the valve washer. The

angle piece is engaged with the bar and forced downward by the thumb when the valve washer is lifted and the cotter easily withdrawn. By tripping the angle piece the spring is released. The device folds up flat, being but five inches long by one inch wide at the widest part. It is listed at 50 cents.

An excellent device shown in connection with the tandem attachment is the stand lifter for machines whose stands are not provided with such an attachment. One end of a spiral spring is clipped to the stand on each side and the other is attached to a bar which in its turn is attached to the luggage carrier frame, or mudguard. On pushing back the stand slightly, the springs snap it into the latch in short order, any kicking up being thus obviated. This device is quoted at 50 cents, per set of two.

CORBIN-BROWN SPEEDOMETER

Well-Known Manufacturing Company Will Market Device Embodying Several New Ideas.

THE Corbin Screw Corporation division of the American Hardware Company, of New Britain, Conn., announces that it will in future manufacture and market the Corbin-Brown speedometer. The device has heretofore been known as the Brown speedometer, but under the new name it will embody a number of valuable improvements. The advent of this corporation in the speedometer field is of unusual interest because of its unlimited capital and its large distributing branches and forces of salesmen at New York, Philadelphia, Chicago and San Francisco.

The Corbin-Brown speedometer is the invention of Colonel W. C. Brown, of New York, and was put to the severest possible tests for accuracy and efficiency before being adopted by the Corbin Screw Corporation. The name "Corbin" has been identified with manufacturing for more than forty years, and the Corbin-Brown speedometer will carry with it the same guarantee which this name has always implied. Colonel Brown, the inventor, will become sales manager of the speedometer department of the Corbin Screw Corporation.

AN F. A. M. NOVELTY.

THE D. & W. Novelty Company, of Gloversville, N. Y., is placing upon the market a neat product calculated to catch the eye of every F. A. M. enthusiast. It is a leather mat of jet black, bearing in red the letters F. A. M.,

and is so arranged that it may be fastened in an attractive manner to the cuff of a gauntlet. The company argues that every rider who salutes a fellow motorist on the road raises his right hand, and that the F. A. M. plate, when attached as in the illustration, will convey a greeting of double import. The idea is one which will probably make a wide appeal.

B. A. Swenson and wife, of Providence, R. I., left Providence early in the week of July 8 on their Indian Tourist twin and side-car, for Columbus, Ohio.

VISITOR FROM CLEVELAND.

BALTIMORE, Md.—The popularity of motorcycle touring is spreading rapidly, if one is to judge by the visitors who come to this city on single-trackers. The last one to pay a visit was Emil Hahn, of Cleveland, Ohio. Hahn left his home on his two-speed Indian on June 29 and rode across country to Syracuse, Buffalo and Albany. From the capital of the Empire State he headed down the picturesque Hudson to New York. From Gotham he went to Philadelphia and thence to this city by way of Wilmington, Perryville and Havre de Grace, reaching here on July 4. He had only one complaint to make, and that was that the road between Elkton and Perryville, in this State, was in a frightful condition. He stated that he had to plow through the deepest kind of sand, and that all he managed to do was creep along on low gear. Every motorcyclist who travels that road has the same complaint, and all are advocating the longer but better route to Philadelphia by way of Lancaster.

After laying over for a day Hahn went on to Washington, from which place he will start homeward by way of Frederick, Hagerstown and Cumberland, Md.; Winchester, Va.; Romney, W. Va., and Pittsburgh, Pa. By the time he reaches Cleveland he will have passed through eight States on his vacation.

HOW THE SIDE-CAR HELPS.

THE Majestic Manufacturing Company, of Worcester, Mass., reports that one of its salesmen, who has just returned from a two months' trip in the West and South, reports the motorcycle trade booming in spite of adverse weather conditions. It is evident from reports of dealers that the side-car business is a distinct boost to motorcycling. A typical illustration is the case of R. L. Davis, the Reading-Standard agent in Louisville, Ky. Mr. Davis informed the Majestic company's representative that the side-car made possible the sale of a twin machine to a customer who would not otherwise buy a motorcycle because he could not take out his wife, who declined to ride tandem. That the side-car, having come to stay, is sure to have a decidedly stimulating influence on the whole motorcycle trade, is an assured fact.

The Majestic company has several hundred side-cars in use in practically all parts of the

Howard W. Tromans, of Providence, and His Comfortable Majestic "Basket."

United States, with a large and rapidly increasing representation in Canada. In the accompanying photograph Howard W. Tromans, of Providence, R. I., appears with his Harley-Davidson and side-car, the passenger in the latter giving evidence of being perfectly at ease.

CALIFORNIAN MADE GOOD HIS CLAIM.

H. CONBOY, a rider of Alameda, Cal., recently rode to the top of Mt. Hamilton, in Santa Clara county, to prove that his machine, which is two years old, could take the grades. The unusual photograph reproduced herewith was taken to prove that the climb was made according to Conboy's claims. The

picture was printed from a double plate on each side of which appears the owner of the machine. What's more, he obtained the snapshots himself, operating the camera by means of the long rubber tube which may be seen trailing away from the machine in each view. Conboy is justly proud of his feat.

PROPOSE NEW ORDINANCE

New York Motorcyclists Would Benefit by Adoption of Regulations Suggested by Special Committee.

MOTORCYCLISTS, as well as automobilists in New York City, will find much to interest them in the report of a special committee on motor vehicle speed regulation which was appointed by the Board of Aldermen some time ago to revise the existing ordinance. The committee is headed by Alderman Ralph Folks, who is of the opinion that more liberal speed regulations should be framed and then enforced rigidly. He suggests that the speed limit for ordinary motor traffic in the city be placed at fifteen miles, and that the limit on highways in outlying districts be made twenty-five miles. The speed limits are now eight miles in the city and fifteen miles in the less congested districts.

The committee's recommendations are based upon the claim that the regulations are now generally disregarded, being looked upon as unreasonable, and that if more liberal limits were fixed the driver who exceeded them could have no excuse to offer. In addition to the fifteen and twenty-five-mile speed limits, however, there are the following special regulations: On approaching bridges or in turning corners of intersecting streets, or in passing schools on school days between the hours of 8 a. m. and 4 p. m., the rate of speed must not be greater than ten miles an hour, and in overtaking or approaching a surface car which has been stopped to take on or let off passengers, motor vehicles must come to a full stop within at least six feet of the car, and must not pass the car until it is again on its way.

Referring to the present policy of the Police Department, the committee's report states that it has been the aim to arrest speed offenders, but the ordinary patrolmen and officers on horseback were helpless when an automobile driver was to be held up. It is pointed out that the only members of the force in a position to cope with the high-powered cars are the motor-cops, and that for this reason the motorcycle squad should be greatly increased in size. It now numbers twenty-five men, not half enough to patrol

adequately the many thoroughfares on which automobile speedsters are wont to disport themselves. One of the committee's recommendations is that additional motorcycle officers be appointed without delay.

Another section of the report deals with the failure of many automobile owners to provide rear lights on their machines. This provision is of prime importance to motorcyclists, as a heavy percentage of accidents in which the single-trackers have figured of late have been caused by the failure of the automobile or wagon driver to display a rear signal. It is stated that ten per cent. of the cars observed on Fifth avenue on a certain night were without rear lights, and that the lamps carried by many others were so small and dirty that it was impossible to observe a light. While these cars remain on Fifth avenue or any other well-lighted thoroughfare the absence of a rear light is not likely to cause serious trouble, but as soon as they take to the open road they become a menace, particularly to motorcyclists. Other automobiles, furnished with two and sometimes three and four headlights, are not likely to strike even an unlighted obstacle when traveling at reasonable speed, but the motorcyclist with his single lamp is in constant danger. If the committee succeeds in strictly enforcing the rear-light provision it will be a most important step toward the protection of the traveler who uses the motor two-wheeler at night.

WASHINGTONIANS ARE GOING.

WASHINGTON, D. C.—Members of the Indian M. C., of this city, are preparing to attend the Columbus meet in a body. They will leave here in the early morning and make Cumberland, Md., a distance of 138 miles, the first day. The second day will take them to Wheeling, West Virginia, 132 miles; the third to Zanesville, Ohio, 72 miles, and the fourth to Columbus, 55 miles. A number of Washington motorcyclists will go to Columbus by train.

A FOUR-THOUSAND-MILE journey on a motorcycle is being taken by E. F. Starke, of Richmond, Va., during his summer vacation. He is traveling west with San Francisco as his destination.

SOME TIRE TIPS

GEORGE M. JOHNSON

EVERY now and then one reads an enthusiastic recommendation written in favor of some brand of tire by a rider who claims to have done anywhere from six to twelve thousand miles "over stony roads," which strenuous treatment has left the tires almost as "good as new," with the raised treads "not even worn down." I don't wish to appear over skeptical, but I do take such rash statements with the proverbial grain of salt. When a rider says that he has done so many thousand miles without his tires showing signs of wear, I think of a short and ugly word, which I am usually too polite (or too diplomatic) to use.

Yet it may be that these riders are actually sincere in their claims, and have overestimated the mileage. Are these wonderful stories of tire service proved by speedometer, or merely guessed at? And there is one other thing. Some machines have the speedometer driven from the rear wheel, which means that the little indicator is registering mileage whenever the motorcycle is being warmed up or adjusted on the stand, unless it is fitted with a clutch that is disengaged as soon as the motor starts. That is my objection to a rear-driven speedometer, and I once mentioned it to a fellow rider whose machine was equipped in that way.

"Oh, I won't run up ten miles in a season," he exclaimed confidently, but when I took occasion to note his methods, I found he was very much mistaken. I know that he added hundreds of miles to his season's score through running the motor on the stand, and he one time even boasted that he could make his speedometer register seventy-five miles an hour—on the stand. Perhaps some of the tire enthusiasts have done this.

Careful Handling Needed.

Now I have ridden for four years, and while I do not pretend to qualify as an expert or anything like it, I feel that I do know a little about motorcycle tires, and I know that there is something exceedingly peculiar about five thousand miles of hard riding without signs of wear. For instance, my new 1912 twin has covered nine hundred miles by Jones speedometer so far this season, and the studs on the rear tire (one of standard make) are worn down nearly flush with the tire surface. If there is really a motorcycle tire made which will last season after season, I should like to get a pair; the whole motorcycling world is crying for such tires. Mine never last quite that way, and they have the best of care and attention, too.

However, there are some things to remember concerning tires, and in view of the many recruits who are constantly joining our ranks, it might not be amiss to note down some of

the important details that will tend to give satisfactory tire service. With motorcycles as automobiles, tires make the biggest single item of expense, and anything that will help keep that down is certainly worth while.

In the first place the tires, especially the rear one, since most of the weight and nearly all of the wear comes on it, should be properly inflated. This is an old, old warning, yet many riders ignore it. Tire experts tell us that insufficient inflation is responsible for nine-tenths of all tire trouble. It causes tires to "rim cut"; they are more likely to be damaged by sharp stones than when pumped hard, and the tire itself is apt to disintegrate. This last is caused by the constant bending of the tire walls under the weight, so that the layers of rubber and fabric tend to part company and break down under the strain.

The Inflation Problem.

Just what is sufficient inflation for a motorcycle tire? A good way to be absolutely sure is to write the tire company and ask them what pressure will give the best results; then buy a gauge and see to it that the tire is kept up to the right point. Of course many details enter this. For a light rider the tire need not be kept so hard as for a heavy one. The following is a good test, if you do not adopt the pressure gauge idea; when the rider is in the saddle, the tire should show practically no depression under his weight. If there is a bulge which is at all noticeable, that tire has too little air, and to ride it for any great distance is to go hunting for trouble.

"Leak so small as to defy discovery."

Another great cause for lack of satisfactory service is in having the machine "undertired"; that is, fitted with too small tires for the work they have to do. Automobile owners have experienced the same difficulty. Putting small tires on a heavy machine may look like economy at first, but it may double the tire expense for the season. Now, applying this to motorcycles, you should be sure that the tire on the rear wheel is big and heavy enough for the task required of it. A two and one-half inch tire is large enough for single work, but if you desire to ride tandem, you are expecting too much of that size of tire. In tandem riding the weight on the rear wheel is increased tremendously, and of course that increases the wear. Therefore for the tandem a two and three-quarter (or even three) inch tire should be specified. If tandem riding is only indulged in now and then, the larger tire is perhaps not so essential, but where the smaller one is used there should at least be plenty of air in it.

Economy in Large Tires.

When a sidecar is driven one should also have a larger tire on the rear wheel than the two and one-half inch, if expense is to be kept down. To be sure, not so much weight comes on the drive wheel as in tandem riding, since the passenger's support is shared between the two wheels, but how about the work that drive tire does? That is even more severe than is the case with the tandem. The rear tire not only has to grip the road hard enough to send forward the double load, to which we must add the weight of the car itself, but in addition there is the side strain caused by the unequal distribution of the weight. So when you drive your sidecar along with a two and one-half inch tire, you are putting on that tire work that it was never built to stand. The mere fact that tires do deliver fair service under such unfavorable conditions only goes to show how far the rubber companies have progressed in the art of building tires.

The new rider does not always realize that a slowly leaking tube may not of necessity indicate a puncture. The valves are quite prone to give trouble, and if the cap does not make the valve stem air tight, a puzzling leak is usually the result. If a tire requires pumping up every twenty-four hours or so, it is a good plan to test the valve before taking the tube out to hunt for a possible puncture; if the leak is really in the tube, this will save a good bit of time and bother. Another place for a puzzling leak is provided by the seam of an endless tube. The leak may be so small as almost to defy discovery, yet it is there, and the rider must pump up the tire several times

a week. One of these seam leaks is also trying in that it is quite difficult to make a sure job of patching; the air seems determined to find a way out somewhere.

The Puncture Bugaboo.

When you are confronted by a sure enough puncture on the road, before removing the tube to explore for the leak, slowly revolve the wheel and look carefully over the casing surface for the cause. There is a fair chance that the trouble was brought about by a nail or bit of wire, and if you can discover where the leak is, you need remove but a small portion of the tube to make repairs. If the puncture is the deadly work of a nail, be sure to look on the other side of the tube, for there is frequently a double hole, where the intruder went clear through. Many riders have had the mortifying experience of finding that the tire refused to hold air after they had put the tube back in place, through their thus doing only half a job. Strong language will never remedy trouble of that kind; the only thing is to begin over again.

A bad cut, one that goes through outer rubber and fabric, should really be vulcanized. Yet vulcanizing is an expensive process, and means also that the machine is to be laid up for a number of days at least, which is a considerable hardship to the average rider. He

can often make more or less permanent repairs himself, by means of the conventional inner blow-out patch. Then the hole in the rubber should be plugged with one of the different brands of tire dope on the market.

I recently accomplished what I regarded as a bit of very clever repairing along this line; the casing was badly cut by a sharp piece of glass or metal, laying open the fabric right down against the tube for a length of three-quarters of an inch. The remarkable thing about it was that the tube was not cut at all, nor did it blow out, even though it was the rear tire that suffered. The cut occurred while I was on a night ride, and I did not discover it till next morning. I cleaned the cut casing, inside and out, with gasoline, and then applied a liberal dose of cement to the inner surface. I then pressed a home-made blow-out patch into service. This was made of two thicknesses of adhesive Pull-e-tape which I had on hand for lagging my front pulley. Over the sticky tape I placed a section of starched cuff, and after giving some minutes for the whole to set, I inflated the tire and plugged the outer hole. Thus at an expense of five or ten cents I saved the vulcanizing bill of two dollars and a half, and was not forced to go without the use of my precious two-wheeler. The tire, though in-

flated as hard as need be, shows not the least swelling or bulge where the cut is located.

Haste Does Not Pay.

In patching a tube on the road it does not pay to be in too much of a hurry. Give the cement plenty of time to get dry and tacky before pressing the patch to the tube. The temptation is for the amateur repairman to slap the patch on right away, so that he can be off down the road with the least possible loss of time. A patch hurriedly applied, before the cement has dried enough, is not likely to hold, as my experience has demonstrated several times. Only lately, I was compelled to take off a patch and glue it on again, because the air still found a way out. I had been so eager to get through that I failed to do a decent piece of work.

In conclusion, let me add this: don't boast about your good luck with tires, if you are so fortunate as to have any. I covered all last season without a single puncture, and was brash enough to spread the good news around without tapping my wooden pate to keep the hoodoo at a distance. I am getting it this season—at the rate of a puncture to every two or three hundred miles. It is always a risky thing to crow over good luck; I'm through with it.

BALTIMOREANS PLAN RACES.

BALTIMORE, Md.—If arrangements now being made do not miscarry Baltimore will have motorcycle races at Electric Park on Labor Day. Howard A. French and the Indian M. C. are promoting the races. It has been almost a year since this city has had any motorcycle racing.

BALTIMORE BREVITIES.

BALTIMORE, Md.—The various clubs are again turning their attention to Sunday runs and weekly spins at night out into the country. Riders who were training for the Fourth of July races at Benning and Laurel will now have time to get out on the road with the other boys and jog along at an even pace.

"The Grand Old Man" of motorcycling in Maryland, Captain W. S. Fisher, of the Indian M. C., is the proudest man in this

old commonwealth. On the Fourth he entered the parade in Druid Hill Park, conducted as a part of the safe and sane celebration, and won a handsome silver trophy for the best decorated machine.

Captain Standiford, of the Maryland M. C., is waiting anxiously for his new mount to arrive so he can again lead the boys on their runs across country.

The riders are turning out in larger numbers on the weekly runs of all the clubs, the diamond-studded gold medal offered by Howard A. French being an incentive. This trophy will go to the member of any club who attends the most runs during the season.

BALTIMORE OUTING.

BALTIMORE, Md.—The members of the Maryland M. C. held their annual outing on Sunday, June 30. Sixty-three riders

went down to Tinley's shore, on the Middle river, and spent a fine day. Besides the dinner there were numerous athletic events on the program. Matt Gault, the former captain, was an easy winner in the jumping contest; the boat race was captured by Robert French and Roy Smith; the old reliable, William Wood, Maryland F. A. M. Commissioner, had things his own way in the quiet and dignified game of quoits; Duke Richardson took the swimming event handily, while Fred Wilkens proved that he was the most expert with the pistol. Howard A. French demonstrated his ability as a champion balloonist. The baseball game, always a feature, was won by the Racycle Club from the Maryland boys by a score of 12 to 9.

TWO new motorcycle policemen have just been added to the squad in Galveston, Texas.

WASHINGTONIANS ON NEW ENGLAND TOUR.

ROAD TIPS AND HOW
TO GATHER THEM

S. S. KALISHER

It was after a long rainy spell last August that I started with a friend on what we expected to be a two-week's ride on our motorcycles, covering a route beginning at Washington, D. C., through New York City and Boston to Portland, Me.; thence across the White and Green Mountains to Burlington, Vt. From this point we turned southward to Albany and New York City and back to Washington, going via Philadelphia, York and Gettysburg.

For some time I had been looking up the best available maps and route books, and had made application to the various New England State highway commissioners for reliable data bearing upon the different routes and road conditions in their respective States. Very little, if any, satisfactory information was obtained from these commissioners, for the reason that they are informed only with the condition of the State highways, and not with those which do not come under their jurisdiction. However, all of the replies I received were of some use, as a general description of the roads was given.

Tips for Tourists.

The best available information is that published in the Blue Book, issued by the American Automobile Association, although by adhering strictly to the routes given therein, it often leads one through roundabout streets in the larger cities and over circuitous routes through the country. In many cases so far as good roads are concerned, a better route can be taken by disregarding the routes as published in the Blue Book, especially in entering and leaving large cities, and making inquiries from reliable sources, such as automobile clubs, garage keepers and motorists for the better roads. Information even from these sources is sometimes misleading, for in sections where good macadam roads predominate, and where there are occasional poor and badly worn stretches of such roads, one may be directed to take such a route instead of a route over a good dirt road; the latter, as every motorcyclist knows, is easier going if in good condition. The danger of being thrown from a motorcycle by the deep ruts, together with the general shaking up caused by the roughness thereof, are two of the most objectionable features of a badly worn and neglected macadam road.

Often, too, directions are given in order to avoid a hill, or a hilly country via a circuitous route over a poor road, on the theory, I suppose, that motorcycles are not hill-climbers. I had the pleasure of demonstrating what a 5 h. twin motorcycle can do over a hilly country to an automobilist, after he had cautioned

me about "the hills." In requesting information one should be specific in his inquiries about the construction and condition of the road in question, i. e., whether it is constructed of macadams, gravel, dirt, clay or sand; and whether any rain has fallen recently, and if so, to what degree. By weighing these subjects properly, one can determine for himself, after some experience, the better road.

How Queries Are Answered.

No satisfactory information, as a general rule, can be obtained from pedestrians and farmers along country roads. They do not measure distances by rods or miles; in answer to questions, one usually gets such a reply as "Oh, it's a bit of road from here," or "it's just above the school house, or Jones' barn," etc., etc. Road conditions are always "pretty good," regardless of the construction or condition. After all, it resolves itself into this: What is a good road? This depends on whether one is accustomed to riding over fine asphalt and macadam roads or over rough dirt, clay and sandy roads; so that, in one case or the other, he will be compelled to base his judgment accordingly.

Recent weather conditions require some consideration, for, although the day on which the trip is started may be perfect, the condition of the weather prior to that day should be well weighed. For instance, a clay road in dry

weather may be almost perfect, but after a week of rain, it may be impassible. Oil-covered macadam roads dry very quickly, the water in fact runs off as it does off a duck's back. In short, the best plan in selecting a route is to consult the Blue Book and outline therefrom, in a general way, the trip and route in contemplation. Inquiries at certain points along the route will be helpful in determining which of the alternate roads are in the best condition. Good road maps are most valuable to carry along, especially where a detour is necessitated on account of road repairing and rebuilding. A speedometer and cyclometer combined is a very valuable appliance to have, as one can locate himself wherever he may be by making a comparison of mileages with the cyclometer and with the Blue Book.

The Matter of Equipment.

I was somewhat at loss to know just what equipment to take along, not alone for the motorcycle, but for myself, in the way of clothes, etc. A fairly "fat" pocketbook, of course, is essential and no mistake will be made in taking double what you expect to spend. With regard to the equipment for the motorcycle, besides the usual tool bag articles, it is well to carry extra spark plugs, a puncture outfit, including a blow-out patch; several pedal pins, miscellaneous nuts, washers, and chain links. As far as one's clothing is concerned, the less taken along the better. Riding in a khaki suit one only needs an extra suit of underwear, a comb, brush (hair and tooth), tooth powder, socks, handkerchiefs, and perhaps a pair of pajamas. While it is economical to mail back the soiled linen, it is easier and sometimes cheaper, to purchase low-priced linen and throw it away when soiled. This will obviate the trouble of wrapping up the bundles and mailing them, which at merchandise rates, often amount to more than 50 per cent. of the value of articles.

Besides one's clothing, an A. A. A. route book (or extracts from it), together with reliable road maps, should be taken along. A bundle of the above articles wrapped in a rubber sheet, and strapped to the handlebars, makes the easiest and most convenient luggage outfit. A luggage carrier is often in the way. I started out with a small telescope bag strapped to my luggage carrier, which, on account of the many unnecessary articles contained therein, was burdensome and heavy; after several days of riding I threw it away (one of the rods of the luggage carrier having broken), and strapped a bundle on the handlebars, which answered all purposes very well. I also carried an Eastman 3-A kodak, with which I took about 60 pictures, although it

A "Fat" Pocketbook is Essential.

proved a very troublesome article because of its frailness and the trouble of getting it in and out of the bag, or the bundle.

The Daily Mileage.

As noted, road maps are very valuable and they can be filed and carried conveniently. Much boasting has been done about the number of miles traveled per day, but for one to appreciate and see the country, including the stops in the larger towns and cities, a run of from 75 to 100 miles per day is sufficient, especially when traveling continuously for two weeks. One cannot make much more than an average of 15 miles per hour for a day's run without fatigue and without violating the speed laws, particularly through a thickly populated States, like Massachusetts, for instance.

The roads in and about Washington, especially within the district line, are usually very good, being constructed largely of macadam with an oiled covering. Between Washington and Baltimore the road for the most part is good macadam, excepting a bad clay stretch between Bettsville and Laurel, Md., a distance of about 5 miles, which is now under reconstruction. After a heavy rain this section of the road is almost impossible to travel over on a motorcycle; one is usually compelled to push a motorcycle for the most part. The Bladenburg road, just out of Washington, is badly worn for about three miles, to a point near Hiattsville, Md., and a short bad stretch of rock road exists just south of Elkridge, Md.

We left Washington for Baltimore just after a heavy rain on a Saturday afternoon in August, it being our intention to take the Errickson Boat Line, plying between Baltimore and Philadelphia, late the same afternoon, in order to avoid a bad stretch of sand road between Havre de Grace and Elkton, Md. In this way we would arrive in Philadelphia early Sunday morning, and, under ordinary conditions, could make the run from there to New York City on Sunday.

A Narrow Escape.

We went out of Washington by way of H street, reaching the Bladensburg road, i. e., the Washington-Baltimore road at Fifteenth street N. E. All went well until we reached Bettsville, Md., when we encountered the bad stretch extending from this town to Laurel. We headed fearlessly up the first hill, then down and over a few more and finally at the base of one we struck a lake, lying peacefully in our path. I went through it at angles too numerous to mention, reaching the summit of the hill well decorated with Maryland clay. At the bottom of the next hill I was not quite so successful. Not that I headed for the next "lake"; I didn't. Instead, I tried to follow a narrow, slippery clay path, but I could not stay on it somehow, so off my wheel I went and into the water. While the fall was not heavy the front fork of my machine was so badly bent that it required the combined strength of four men to straighten it out. For the greater part of the 5-mile stretch, we were obliged to push our machines and we reached Laurel somewhat exhausted. All went well again until we reached Elkridge, where the B. & O. R. R. crosses the road. A freight train had just passed, and in order to reach Baltimore in time to catch our boat I pressed forward. Just as I was about to cross the tracks the gates came down and I had the option of either breaking through them or doing the next best thing. I chose the latter—

Grant's Tomb, New York.

at least it appeared so—for I found myself "bumping the bumps" over the rails and finally I pitched over the handlebars of my motorcycle and landed between the tracks in front of the approaching train. It is needless to say that I did not stop to think twice. I got out of the way, and with the assistance of several men I placed the remains of my motorcycle in a baggage car and returned to Washington.

A Fresh Start.

On the next Saturday afternoon, after my motorcycle had been repaired, we started out again for Baltimore, reaching that city just as it started to rain. We got aboard the Philadelphia boat, wet through and through, and after having dinner we decided to "turn in" for a good night's sleep. Any one who has taken this trip by night, and especially those occupying a forward berth, will tell you that sleep is out of the question, especially while going through the canal between Chesapeake City and Delaware City. The disturbance—a continual one—is caused by the operation of steering apparatus, which I discovered later was on the order of a donkey engine, which when set in motion, fills the boat with a rumbling clattering noise that no number of motorcycle, with mufflers wide open, could outdo. After leaving Delaware City I snatched a short nap, only to be awakened by the breakfast bell, which, regardless of my sleepless night, was music to my ears. After breakfast we enjoyed sitting on the deck of the boat up the Delaware river, going over our itinerary and maps and finally reached Philadelphia about three hours late.

A little time was spent in getting our machines out of the boat and getting a supply of gasoline, which the garage keeper insisted "contained no water," and did not need to be

strained through chamois. If space would permit, it might prove interesting to the reader to know what I said and did, when after considerable delay out on a country road with not a sign of human existence in view, I took almost the entire engine apart only to find water in the carburetor. "Never again" was the slogan, so at Trenton, we emptied our tanks and refilled them with strained gasoline. The road to Trenton for the most part is very good on the Pennsylvania side, except for a short worn stretch of macadam of about two miles. We followed the course as given in the Blue Book, which, while somewhat troublesome to a motorcyclist in getting out of Philadelphia, nevertheless proved to be a series of good macadam roads.

At Trenton we paid 10 cents toll and attached our non-resident New Jersey licenses. New Jersey was the only State north of the Potomac river that required non-resident license and this regulation has since been set aside for motorcycles. The roads are practically perfect. One never needs to inquire about New Jersey roads; they are nearly all in fine shape.

We reached New Brunswick, N. J., late in the afternoon over a fine macadam road, had some lunch, and then headed for New York City by way of Perth Amboy and Staten Island. By following the New York automobile signs along the way headed with an arrow "To New York," we soon found ourselves well towards Elizabeth, N. J., so instead of turning back to go via Perth Amboy, we continued on our way into Elizabeth and decided to stay there overnight.

The Arrival in New York.

Early the next day it rained. When it stopped at noon we started off over slippery roads to Newark, N. J., where we were compelled to travel over cobblestone streets for about three miles. A fine asphalt road extends across the meadows to Jersey City, at which place we followed an automobile with a New York license, which took us over a roundabout macadam road and a short stretch of cobblestone street to the Pennsylvania Ferry. We paid a ferry toll of 10 cents for each machine, and were soon in New York City. We went up West street to Eleventh street and then across to Fifth avenue. After many stops at street crossings we reached Central Park, and after visiting the Zoo we headed for Harlem, where we remained over night.

The next morning we started for Meriden, Conn., and chose the old Boston Post road for our route to Boston. We reached New Rochelle and then rode on through Stamford, South Norwalk and Bridgeport, Conn., reaching New Haven well into the afternoon. From this place there are too good roads leading to Hartford, one by way of Meriden and the other by way of Middletown. We chose the former and for a short stretch we had the pleasure of racing with a N. Y., N. H. & H. R. R. passenger train. We reached Meriden, Conn., late in the afternoon and remained there overnight.

The next morning we left for Worcester, Mass., by way of Hartford, Windsor Locks and Springfield. Between Windsor and Windsor Locks the road was closed for repairs and it was necessary to make a detour over a very sandy stretch of road five miles long. We took several spills in going over this stretch, and after pushing our wheels over several hills we reached Windsor Locks, crossed the Connecticut river and followed a fine macadam

In the Connecticut Valley.

road into Springfield, Mass. Just before entering Springfield we came across a road oiler which was spraying its blackish substance upon the road. In trying to go through, or over this newly oiled section, our machines skidded and before we could bring them to a stop, both of us landed upon the road. We picked ourselves up, all covered with tar-oil and later, at Springfield we, as well as our clothing, had a gasoline bath.

It was 4:30 when we left Springfield for a 50-mile run to Worcester, over one of the finest roads in Massachusetts. This stretch is sparsely settled; in fact, in many places no signs of human habitation are seen. I lost my friend at Palmer on account of our hurry and determination to reach Worcester before dark, and rode without a stop into Worcester. There we met and remained overnight.

The Run to Boston

Late the next morning we headed for Boston by way of Marlboro, Maynard, Concord and Lexington, partly over very good macadam roads. We spent several hours both at Concord and Lexington, taking in the various places of interest, and reached the outskirts of Boston in the afternoon. As in most of the larger cities, we soon struck a badly worn macadam road at Arlington, which later developed into a cobblestone street. We crossed the Harvard Bridge over the Charles river into Boston and left our motorcycles in a garage nearby. We spent the next day visiting the numerous places of interest, such as the old State House, Christ Church, Faneuil Hall (the cradle of American liberty) and Bunker Hill monument.

Our next stopping point was Portland, Me., by way of Newburyport and Portsmouth, N. H. We were advised to take a route via North Andover and Merrimac to Newburyport, which we did in order to avoid the narrow cobblestone streets of Lynn, Salem and Beverly. However, a portion of this route proved very rough on account of road building and repairing, but as a whole, it is preferable to the route through Lynn, Salem and Beverly on account of the condition of the streets in these cities. Rain overtook us just as we left Merrimac, but we rode on in it, reaching Newburyport just before noon, thoroughly soaked. The rain continued almost in torrents all of the day, so in the evening, in company with a friend, we enjoyed a typical New English fish and clam dinner at a restaurant on Plum Island.

Minute Man, Concord, Mass.

City Hall, Worcester, Mass.

On the Return Trip.

The next day, after receiving definite information as to the almost impassible roads between Portsmouth, N. H., and Portland, Me., due largely to the heavy rains, we decided to return to Boston by way of the "coast" route. It was noon when we left Newburyport and the roads were very slippery. We picked our way over a macadam road through Beverly, Salem and Lynn and entered Boston by way of Revere Beach Parkway. We were sorry to miss a visit to the President's house at Beverly, and the Roger Williams House and the First Church at Salem, but were compelled to do so on account of weather conditions, and the desire to reach Boston that evening. Early the next day in a fine rain we headed for Plymouth by way of Quincy and the shore route. A fine oiled macadam road extends for the entire distance. After lunch at Plymouth and a visit to Plymouth Rock and to the National Monument to the Pilgrims, we headed for Fall River, which we reached about dark, after some hard going over partly sandy roads. Here we remained overnight and left on the following day for New London, which we reached in the afternoon. At Newport we took a ferry across Narragansett Bay to Jamestown, rode across Conanicut Island and then took another ferry to Saunterstown. The roads all the way to Narragansett Pier are good, but at the Connecticut State line, and practically along the entire shore line to New Haven, Conn., the road is not at its best as it recently was given a coat of oil, and a light sand dressing.

Upon leaving New London the next day for New York City, I was advised to take the "shore route" via South Lynne instead of the upper road via Flanders to Saybrook. It proved to be a very sandy and hilly road which made riding somewhat difficult, but we reached Saybrook without any mishap, taking the regular trunk road at that place. I was told at this place that the upper road was all macadam. We passed on through New Haven and back over the route to New York City, reaching the metropolis after a hard day's run.

Having remained at Harlem, we left early the following day, headed through Central Park, down Fifth avenue to Broadway and down to the Battery, where we embarked on the Municipal Ferry for St. George, Staten Island. This we accomplished after several narrow escapes from collisions with pedestrians, especially in lower Broadway. Leaving St. George, we continued over a fine, but winding

macadam road to Tottenville, but before reaching this place I had an unfortunate and unavoidable collision with an Italian fish peddler, who, while trying to cross the road with a basket full of fish and shrimp on his shoulder, passed in front of my machine. In a second the street was strewn with fish. After some delay, caused largely by a wrathful officer of the law who tried to get the Italian to have us arrested, we reached Tottenville, crossed the ferry to Perth Amboy and returned to Philadelphia, reaching there in another rainfall.

On the Home Stretch.

The following day we left Philadelphia for York, Pa., by way of Coatesville and Lancaster. The going was bad, due largely to the long rainy spell, and the general condition of the road which for the most part was unfit for travel. Several fine but short stretches of macadam road, however, were encountered.

On leaving York the next day for Gettysburg we were advised to go via New Oxford instead of via Hanover, on account of the condition of the dirt roads on the latter route. A fairly good macadam road extends to New Oxford, but the abandoned pike from that place into Gettysburg is almost unfit to ride on.

We spent some time in and around the battlefield at Gettysburg and left there in the afternoon for Frederick, Md., where we remained overnight. A very rough dirt road extends from Gettysburg to Emmitsburg, Md., but from this place a fine macadam road runs direct, down grade, into Frederick. There are three routes leading from Frederick into Washington; the first is via Hyattstown and

"The street was strewn with fish."

Rockville, and while the shortest and most direct route, it is, however, a rough one, especially in the vicinity of Hyattstown. For the most part the road is composed of dirt and rocks as far as Rockville, from where a fine macadam road runs directly into Washington. The second route is via the National Highway—a fairly good but somewhat rough stone and gravel road to Ridgeville, thence

south over a new macadam road through Damascus and over a good dirt road to Laytonsville, where a fine macadam road leads into Washington Grove and Rockville, where it connects with the first route as given. The third route is via the second route given above as far as Laytonsville. From this place a good dirt road leads to Only. Here the old Seventh street pike intersects a poor stone and gravel road leading through Wheaton and Sligo direct into Washington over Georgia avenue. Of the three routes given, the second, via Ridgeville, Laytonsville, Washington Grove and Rockville is by far the best.

The Trip in Summary.

The following schedule shows in summary form the days of travel, the places reached and the distances traveled:

Saturday, Washington to Baltimore, 44 miles, rain in afternoon; Sunday, Philadelphia to Elizabeth, N. J., 84 miles; Monday, Elizabeth to New York, 15 miles, rain in morning; Tuesday, New York to Meriden, 95 miles; Wednesday, Meriden to Worcester, 94 miles; Thursday, Worcester to Boston, 45 miles; Friday, Boston; Saturday, Boston to Newburyport, 48 miles, rain in afternoon; Sunday, Newburyport to Boston, 48 miles, rain in morning; Monday, Boston to Fall River, 85 miles, showers all day; Tuesday, Fall River to New London, 68 miles; Wednesday, New London to New York, 115 miles; Thursday, New York to Philadelphia, 94 miles, rain in afternoon; Friday, Philadelphia to York, 90 miles; Saturday, York to Frederick, 63 miles; Sunday, Frederick to Washington, 52 miles.

BROOKLYNITE GIVES TIPS FOR TOURING

How to Select the Essentials in Equipment for Long Road Trips and Eliminate Articles Which Encumber the Luggage Without Being of Practical Value—An Ideal Riding Costume.

WITH preparations complete for the 1912 tours to the F. A. M. convention and general touring interest at top pitch throughout the country, thousands of motorcyclists are facing the old equipment problem—the question of what to carry on the road, and how to carry it—and for that reason the following information is doubly pertinent. It is submitted by William Hetherington, Jr., a motorcyclist of Brooklyn, N. Y., who has found that the choice of clothing and equipment makes or mars the average tour. Mr. Hetherington is a rider of several years' experience, and his suggestions are based upon first-hand observations.

"The usual mistake of the inexperienced motorcyclist," says the Brooklynite, "is to overload his machine with articles which should have been left behind, and overlook the items that are of prime importance. Experience will remedy this tendency, of course, but in the meantime the rider is putting up with a lot of annoyance which is overcome by the tourist who gives careful consideration to the necessities for his outing. Obviously, the quantity and scope of the equipment depends upon the length of the tour to be made and the character of the country to be traveled, but for general purposes it is safe to base our calculations upon a two-weeks trip. The suggestions I am about to offer refer to the arrangements for such a tour.

"To begin with, the equipment may be divided into two sections, motorcycle articles and personal effects. For the motorcycle, in addition to the regular tool kit, it would be well to carry a 6-inch flat file, which will be found to have a surprising range of service; a spoke wrench, a 3-inch piece of soft iron or copper wire and spare nuts for the front and rear axles. These articles will require very little room, and when they are needed they come very close to being worth their weight in gold. An extra pedal pin should be carried to replace the pedal which is almost certain to be broken at some stage of the journey—usually in a district where a repair shop sign has never been known to dot the landscape. Inner liners for the tires will prove very valuable and will do away with the necessity for carrying an unwieldy load of patches and cement. A supply of "prepared" patches should be carried for punctures, but the inner liners will greatly reduce tire troubles, and incidentally reduce the size of the repair kit.

"Only the most inexperienced rider will venture upon a long trip without a large hand pump; a small one may seem more desirable at the start, but after a few pumping experiences the tourist will see his mistake. Spring clips for holding the pump will pay for themselves in satisfaction in short order. An extra chain or belt link should always be carried, and failure to have it in an emergency may mean a hot, tiresome walk to the nearest

town. It is also well to carry a pocket oil can; squeaks that develop in the running gear on long jaunts are usually trivial if given prompt attention, but if neglected they may pave the way for a break or other trouble. At any rate the pocket oil can is worth the room it occupies.

For carrying his personal effects the motorcyclist will find that a small leather suitcase, about 16 x 14 x 10 inches, will best suit his purpose. This will be of a very convenient size for strapping on the luggage carrier, and it may be so fastened that it can be quickly removed. The following articles are essential, and all of them can be conveniently carried in the suitcase. They are: Three suits of underwear, six pairs of socks, four handkerchiefs, two negligee shirts, a Litholin collar, a necktie, small pocket comb, brush and mirror; small whisk broom, tooth brush, tooth powder and hand paste. A small bottle of peroxide of hydrogen, a piece of court plaster and a bandage roll are also desirable articles in the touring equipment. A pint bottle of grain alcohol or witch hazel may also be carried by the rider who needs to rub out the "kinks" in his limbs after the first day or two of road work. In the rider's coat pocket may be carried a collapsible drinking cup, which at times will rank as just about the most important article in the entire outfit.

For wearing apparel a salt and pepper whipcord suit and cap to match, make the best

combination. Army duck leggings are far more comfortable than leather for warm-weather riding, and they afford full protection. I have also found kid gloves more satisfactory for the hands than a pair of heavy gauntlets. When the run for the day is over and the rider desires to "spruce up" for the evening a piece of art-gum will remove the dust from collar and cuffs and the more noticeable stains of travel from the clothing. If the rider desires to be protected from sudden showers which may overtake him on the road he may carry a raincoat. It can be rolled up and strapped on the handlebars or tank of the machine when not in use, and will take up very little room. I have found that half the pleasure of a trip by motorcycle lies in being properly equipped, and as the suggestions offered above have been of practical value to me I feel that they should assist other riders in getting the most out of their summer jaunts.

A NERVY GIRL RIDER.

MISS ADA KLEIN, of Newport, Ky., who appears in the accompanying photograph on her 4 h. Excelsior, is the only girl motorcyclist in her section of the State. She

has been a rider for nearly a year and has made a number of fairly long runs, always returning with her mount in good shape. Miss Klein sometimes takes her younger brother out for a short jaunt as a tandem passenger.

DENVER'S NEW MACHINES.

FOUR new motorcycles have been purchased for the flying squad of the Denver (Col.) police department. With a view to giving different makes of machines a general test the Fire and Police Board decided to invest in an Excelsior, an Indian, a Harley-Davidson and a Flying Merkel. An itemized account of the running expenses for each day will be kept, and at the end of three months an expert machinist will be called in to test the machines and give an opinion as to the relative deterioration. This trial, in combination with the expense account, will determine which machine is to be adopted as the regulation mount for the city's police department. Twelve new machines will be added as soon as this decision is arrived at. The motorcops will wear a khaki uniform with cap to match, and pigskin puttees. Bids are being received on these riding togs by the Police Board.

LOUIE BREIT, trouble man for the Missouri and Kansas Telephone Company, at Coffeyville, Kan., has purchased an Excelsior machine to use in his work.

NEW TYPE OF ROAD-HOG

Motorcyclists of Coffeyville Are Anxious to Locate Farmers Who Forced Rider into Ditch.

MICHAEL HIGGINS, of Coffeyville, Kan., recently was made the victim of as contemptible and uncalled-for a trick as a motorcyclist has ever had to contend with. While riding along a country road Higgins saw a team of horses approaching him, drawing a wagon which was occupied by two men. Higgins cut out his power and practically stopped his machine to avoid frightening the horses, and was about to dismount when the men signaled him to continue. At the same time they pulled their horses to the side of the road. Higgins opened up his throttle again and headed down the road to pass the wagon. When the rider was only a few yards away the men in the wagon suddenly turned their horses across the road in front of him. There was no time to stop the machine, and Higgins was called upon to make a quick choice between riding full-tilt into the horses or going into a ditch at the side of the road. He chose the latter course.

Unfortunately the sudden jerk as the machine left the road broke the spark control and Higgins was unable to stop his mount. Instead of falling in the ditch the motorcycle mounted a hill on the other side, tore through a hedge fence and chugged into a freshly-plowed field. Here it turned over and gave Higgins a bad fall. Bruised and bleeding, the rider crawled back to his machine and stopped the motor by yanking off the magneto connections. Then he looked for the men who had caused the trouble and saw them standing up in their wagon enjoying a hearty laugh at his expense. When they saw that the "fun" was over they whipped up their horses and disappeared. When Higgins reached his home it was necessary to have three stitches taken in his nose and two over his right eye. No clue has been obtained as to the identity of the men in the wagon, but if they are ever located Higgins and his fellow riders of Coffeyville are going to leave nothing undone to make things exceedingly warm for them.

MARKING CROSS-STATE TRAIL.

THE Waubonsie Trail, a well-known trans-State highway across southern Iowa, has been extended to Indianapolis, Ind. This trail is the first marked road across Illinois, according to the statement of W. J. Staples, of Shenandoah, who has just made the trip by automobile to Indianapolis, marking out the road. The road now reaches westward as far as Lincoln, where it joins the River-to-River road to Denver. The new trail passes through Beardstown, Springfield, Decatur, Champaign and Danville in Illinois.

A PROSPEROUS CLUB.

AT the last meeting of the Toledo (Ohio) Motorcycle Club J. W. Siler was appointed as delegate to the F. A. M. convention and A. B. Coffman, of the Consolidated Mfg. Co., was named as alternate. Six applications for membership were received by the club at this meeting, and the treasurer reported that with all bills paid there was a balance of \$100 in the club's coffers.

TIP FOR WAGNER RIDERS.

E. N. PATTON, of Hattiesburg, Miss., submits the following tip for owners of Wagner motorcycles. While on a 75-mile trip recently he broke the exhaust valve of his machine and was in dire straits until he thought of using a Ford automobile valve. He managed to reach a town called Laurel, where a Ford valve was obtained, and the only change necessary was the enlarging of the pin hole. With this makeshift fitting he made a return run of about 35 miles without difficulty.

VICTORY FOR SIDE-CAR.

STILL the side-car boom continues to grow. In the accompanying photograph an Ohio enthusiast is shown exulting over the fact that his fair passenger, who is taking the picture, has just refused an invitation to desert the side-car and return home in an automobile. The machine is a Flying Merkel 7 and the basket is one of the comfortable new Baxter models.

NEWS FROM THE NORTHWEST.

RAY TEMPLETON, one of the most enthusiastic motorcyclists of Portland, Ore., started a few days ago on a trip to Indianapolis by motorcycle. Templeton did not bother figuring a riding schedule, as he is in no hurry to get over the road. He will spend considerable time in Spokane, Boise, Salt Lake, Denver and Kansas City on his way to the Hoosier capital. Templeton mounts a Harley-Davidson.

Clinton Hull, for some time past president of the Tacoma (Wash.) M. C. has found it necessary to resign, and his duties will be taken up by John McCain, one of the best-known motorcycle boosters of the city.

H. H. Armstrong, who has the Portland (Ore.) agency for New Era machines, has also contracted to act as distributor of the New Eras for Oregon and Washington. His establishment is at 1327 Fourth avenue.

ENTERTAINED A WARRIOR.

A PICTURESQUE visitor at the home of Flying Merkel machines in Middletown, Ohio, not long ago, was Chief White Eagle, a full-blooded brave, who announced that he hailed from Indian Territory. He was driving a team of horses with which he is touring the country. White Eagle inspected the Merkel plant, but refused to mount a motorcycle.

MOTORCYCLE speeders in Des Moines, Iowa, must pay a \$100 fine for their second offense, according to the announcement of Police Judge John T. Conroy. Three speeders were arrested recently, who confessed to careless riding. They were each fined one dollar and given the above warning.

A VERSATILE HOST

J. S. Bretz Entertained the Cheer-Up Association and Also Gave Some Pointers on Cricket.

AS merry a crew of congenials as ever embarked from New York City on the trail of cooling breezes and all the other essentials of a "big day," went down to Eckstein's brewery on Staten Island on June 17 to be formally initiated into the J. S. Bretz Cheer-up Association, and thereon hangs the tale of an outing which will stick in the memory of its participants for many a day. As is generally known, Herr Bretz finds plenty to keep him busy in the J. S. Bretz Company, which specializes on the importation of F. & S. bearings and U. & H. magnetos, but he is enough of a philosopher to realize that the man "works best who plays best." Accordingly, he is an enthusiastic follower of outdoor sports and a believer in recreation in the broadest application of the term. His activities as host throughout the Staten Island program proved this to his friends beyond question, for the J. S. Bretz Cheer-up Association lived up to its name from soup to nuts and from schweitzerkase to a certain dark brew which was much in demand. In other words, there were eatables, drinkables and good nature in abundance, not to mention widely-varied athletic contests and a series of cricket games.

Speaking of cricket, by the way, a game was in progress on a certain Staten Island field not long ago when a crack batsman knocked a long fly which appeared to be good for four runs. But it wasn't. Just as the ball seemed to be flying clear, a six-foot athlete in flannels ran out and caught it in his ungloved hands. The flanneled player was Captain J. S. Bretz, leader of the first team of the Veteran Cricketers' Association. All of which is a mild way

of saying that Herr Bretz is a man of many sides, all of them worth knowing.

GOOD NEWS FOR RIDERS.

THE law which compels the people of Iowa to cut weeds and drag their roads must be strictly obeyed, according to an edict pronounced recently by Attorney General Cosson. Mr. Cosson sent the word to the State convention of county attorneys, in session at Cedar Rapids, to impress the importance of the two laws upon them. This is good news for the motorcyclists of the rural districts of Iowa, for the road drag is the best-known remedy for the "chuck hole" which is the terror of the touring motorcyclists.

QUINCY HAS A MOTOR COP.

EDWARD MENKE, a well-known motorcyclist of Quincy, Ill., has been appointed as the city's first motorcycle cop. He mounts a Pierce single, furnished by John Ridder, Pierce agent in Quincy. Of late drivers of motor cars have been using some of the more prominent streets as speedways, and it will be Menke's duty to remedy the situation or yank the offenders into court.

The Oscar Kathman Co. has opened a high-class motorcycle shop in Quincy, which will be headquarters for Flying Merkel machines.

ESCORTED THE AUTOMOBILISTS.

MOTORCYCLISTS of Des Moines, Ia., rode to the outskirts of their city on June 29 to greet the automobilists participating in the big tour of the Denver Chamber of Commerce, who passed through Des Moines in their trip over the famous River-to-River road. The single-trackers escorted the car owners through the city and several miles out on the highway.

A MOONLIGHT OUTING

Savannah Club Escorted Big Squad on a Five-Hour Jaunt—Fans Are Working for a Track.

SAVANNAH, Ga.—Five hundred Savannah motorcyclists and their friends participated in the second annual moonlight outing of the Savannah M. C. on Thursday night, June 27. The procession got under way at 9 o'clock in the evening and was not disbanded until about 2 a. m.

The new officials of the club are developing plans for several social and racing programs to be held during August and September. There is some talk of holding two 100-mile events, for singles and twins, on Labor Day. An endurance run to Augusta, Ga., is on the tapis, and plans are also being discussed for beach races to be held at Tybee. Owing to the success of the lantern parade held some time ago, it is likely that another will be arranged in a week or two. On the whole, there is no danger of the club riders finding life monotonous for the remainder of the season.

Of late some of the club members have been boosting a scheme to obtain a dirt track, three-quarters of a mile to the circuit, in or very near Savannah. It has been suggested that the club should subscribe \$500 toward defraying the expense, and other individual members and local dealers have stated that they are prepared to make donations.

FRED VAN LIEW, superintendent of public safety in Des Moines, Ia., has requested that four new motor cops be added to the police squad. The city now has three motorcycle officers who have shown excellent results.

DOING STUNTS ON HENDERSON.

IN the accompanying photographs are shown Henderson machines, snapped while their riders were executing stunts on Belle Isle, Detroit's beautiful little island park, which is located on the Detroit river. The low center of gravity and the even distribution of weight and power in the Henderson machines enable the rider to take unusual liberties and the two enthusiasts shown in the pictures appear to be perfectly at home as they spin along over the driveway. Visitors to Belle Isle see many Hendersons these days, and the clean-cut lines of the machines, the absence of vibration and noise and the obvious ease with which the motorcycles are handled deeply impress all who give them even a passing glance.

PLANNING FOR BARBECUE.

THERE was a large turn-out of members of the Atlanta (Ga.) M. C. on a recent social run to Hampton, Ga., and, as a result, plans are being laid for a number of other outings. Trips are being arranged to Warm Springs, Tallulah Falls, Rome, Chatanooga and other points, and interest in the club affairs runs high. On Sunday, July 30, the club will make a run to Folsom's Park, 16 miles from the city, where an old-fashioned Georgia barbecue will be prepared.

CLUB IN MIDDLETOWN.

MOTORCYCLISTS in Middletown, Ohio, have formed a club and steps are being taken to affiliate with the F. A. M. F. M. Wittlinger, of 523 Yankee road, is secretary. The club held its first meet on July 4 and plans are being laid for several social runs.

FOUR CLUBS PROMISED.

AMONG enthusiasts who announce that they have new F. A. M. clubs on the way are the following: Willard E. Smucker, of Orrville, Ohio; Walker & Snyder, of Missoula, Mont.; Harry K. Bergerud, of Fergus Falls, Minn., and A. C. Penteter, of Watertown, Wis.

A FULL-FLEDGED ENTHUSIAST.

IN the accompanying photograph appear F. B. Shear, of Oakland, Cal., and Mrs. Shear, the latter piloting the twin Excelsior on which they have made many long trips. A new Excelsior was ordered some time ago, but Mrs. Shear became so impatient while waiting for it to arrive that she talked her husband into buying a Thor single for her personal use. Formerly she had not ridden alone, but after driving the Thor for a week she decided that she would not care to ride

any other way in future. As a result Mr. Shear will have the new Excelsior all to himself when it arrives.

A SIX-DAY TRIP.

WALTER BACON, of Gas City, Ind., accompanied by Mrs. Bacon, has just arrived in Philadelphia, Pa., after a highly successful motorcycle trip across country. They traveled via Ft. Wayne, Ind., to Sandusky, to Cleveland, to Erie, Pa., to Buffalo, and thence through Syracuse, Binghamton and Scranton to the Quaker City. The distance covered was 1,025 miles, and the running time was six and a half days. No tire or mechanical trouble was experienced, and Mrs. Bacon

was so well satisfied with the trip that she expressed her willingness to return in the same manner. Thirteen gallons of gasoline were used and about two and a quarter gallons of oil. The total running expense was \$22. Bacon states that he used a 29 by 2 3/4-inch Goodyear tire on his rear wheel. The accompanying photograph was taken in Gas City just before the riders started on their long jaunt.

EXPORTS INCREASING.

WASHINGTON, D. C.—Figures submitted by the Bureau of Statistics, Department of Commerce and Labor, for May, show a big increase in the value of bicycles, motorcycles and parts exported from the United States. In May, 1912, the value of such exports was \$143,898, as against \$82,445 in May, 1911. For the eleven months ending May, 1912, the total value of such exports was \$1,020,912. For the same period ending May, 1911, the total value was \$797,595. For the same period ending May, 1910, the total value was \$550,198.

RALPH DE PALMA, the near-winner of the 500-mile race at the Indianapolis Motor Speedway, began his racing career as a motorcycle racer.

CONGDON IS A WORKER.

MOTORCYCLISTS of Baltimore, Md., are congratulating Samuel H. Congdon, chairman of the legal action committee of the Maryland M. C., upon the success of his efforts to place motorcycle legislation in the Monumental City on a reasonable basis. Not long ago the City Fathers entered upon a campaign of ordinance-framing to curb owners of the single-trackers, and one of the provisions was that all motorcycle muffler cut-outs must be permanently sealed. Chairman Congdon and his committee took a hand in the matter and succeeded in having a number of revisions made. The cut-out sealing clause was stricken out of the ordinance.

PASTOR ON FOREIGN TOUR.

THE Rev. Alfred H. Backus, pastor of the Methodist Episcopal Church in La Grange, Ind., has sailed from Montreal, Can., for a tour of Europe by motorcycle. He mounts an Excelsior single, and intends to divide his outing into three parts, "John Wesley's Circuit by Motorcycle," "The Italian Trail of St. Paul by Motorcycle" and "European Mission Stations by Motorcycle." He will return to resume his pastoral work in La Grange in October.

A MOTORCYCLE TRAVELER

KENNETH SMITH, who travels Iowa and Nebraska for the Globe Tanning Co., of Des Moines, is a believer in motorcycles in general and a booster for the Henderson in particular, as the accompanying photograph indicates. It will be noted that Smith carries a large sample

case, but despite this extra load he has experienced no difficulty in plugging over usually rough roads in Nebraska.

WASHINGTON, D. C.—The next big event in the motorcycle line for this locality will be the meet at Benning's track, Labor Day.

A HANDY OUTFIT.

FROM Trenton, N. J., come the unusually interesting side-car pictures reproduced herewith. One shows David Sanford, a painter, who does not hesitate to load his basket with the materials of his trade when it is not being used for passenger work. He says the outfit is a time and money-saver. In the other photograph a Trenton patrolman is using Sanford's outfit in an emergency case. The side-car passenger has looked too long upon the amber fluid so widely popular during the recent hot spell, and is therefore not in a position to appreciate his first side-car ride.

HABICH'S BIG OUTING

Two Hundred Motorcyclists Enjoyed Day at Woodland Camp of Genial Indianapolis Dealer.

INDIANAPOLIS, Ind.—“Lost—One perfectly good duck, somewhere in the vicinity of the Habich camp in the central part of Indiana. Finder may keep it.”

While the above notice has not been inserted in the “Lost Column” of any newspaper, it might well go there. On Sunday, June 30, Gus Habich gave his fourth annual motorcycle run and picnic at the Habich camp, just fifteen miles of good road north of Indianapolis, and the feature of the outing was a duck chase. As will be inferred from the above notice, there is still a good duck dinner waiting to grace the table of the lucky person who can find it.

Four ducks were released in the river at the Habich camp, but when about forty motorcyclists swam after them three of the fugitives were captured. A motorcycle may be fast on a board track, but when it comes to the water the ducks have a lead. It took Charlie Bramlet, who captured the first of the three ducks, just twelve minutes to do so, and at the end of the chase Bramlet was much more exhausted than the duck, which made the fatal mistake of climbing out on dry land instead of sticking to the water. The other two “roasts” were captured by Leo Banks and Jim Chadwick. The latter had to swim fully half a mile. This event was the “mystery contest” which Habich had promised, and it was a fitting finale to the big picnic.

There were fully 200 motorcyclists present at the picnic, although only about 125 machines were in line for the picture in front of the Habich motorcycle shop at the start. A ball game was played in the morning at the picnic grounds, and by the time the dinner bell rang every one had a great appetite. As usual, the dinner that Habich served was a top-notch.

In the afternoon all kinds of contests, from motorcycle obstacle races to ladies' running races, were held and good prizes were awarded. The fifty-yard dash for the thirty ladies present furnished some excitement, and the winner, Miss Viola Allen, went home carrying a good camera. Harry Graff, president of the Indiana Motorcycle Club, and George Stone, of the Indianapolis motorcycle police squad, mated up for the three-legged race, which they won. They were awarded Thermos bottles as prizes.

Motorcycle “cop,” Dick Pressly, was a

runner-up in the obstacle race in which the motorcyclists had to ride across country and dodge bottles which were arranged so that only the most skillful riders could make the trip without knocking the obstacles over. Fred Small and Will Bryan took first and second places respectively.

To make the day more enjoyable for those who cared to smoke, Edward W. Mink and Lester G. Sigourney, of the New Departure Manufacturing Company, passed around the famous special brand of New Departure fifteen-cent Havanas. The two salesmen were extremely popular by the time they opened the second box of cigars.

The day was fine and the picnic was the best Habich ever gave, which is saying something.

ONE FORM OF AMUSEMENT.

THE motoring community of Toronto has been up in arms over the despicable action of some narrow-minded individuals who have been deliberately scattering large tacks on the main roads leading out of the city. A number of the Toronto riders have suffered punctures as a result of the mean trick. A reward was offered for the capture of the offenders but the latter have so far eluded the authorities.

Miss Ley, of Columbus.

PETERSON WAS GAME

Denver Sheriff Wrecked His Motorcycle in a Thrilling Race with a Union Pacific Train.

SHERIFF CHARLES E. PETERSON, of Denver, Col., is nursing a score of bruises as the result of trying to beat a Union Pacific train at its own game, a contest in which he lost out when the motorcycle he was riding broke down two miles south of Platteville. Peterson was serving papers in that part of Weld County and drifted into Brighton, where he met a friend. They stood talking until the afternoon train was about ready to leave.

“See you later,” said the friend, an officer.

“You’ll see me sooner than that,” was Peterson’s response, and he and the engine started at the same time. Passengers became interested in the race, as mile after mile was reeled off. The rider was ahead of the flyer when something snapped. The frame cuddled up close to the front wheel and the machine, then traveling at forty miles an hour, stopped. Peterson kept on going for about sixty feet.

The passengers thought he had been permanently disabled, but Peterson jumped to his feet and waved his cap. He applied baling wire to the motorcycle and later arnica to himself, and still maintains that he could have beaten the train if his machine had not been taken with cramps at such a critical time.

ELECT TRAYMORE OFFICERS.

THE Traymore Athletic and Motorcycle Club, of 623 West Girard avenue, Philadelphia, Pa., held its annual meeting and election of officers recently when the following staff was chosen for the current year: Andrew Schickling, president; David Dunn, vice-president; Albert Fairfield, secretary; Clem Kieffer, treasurer, and William Germann, recording secretary. Secretary Fairfield announces that he will be glad to hear from touring motorcyclists who intend to visit Philadelphia, and explains that the club is laying plans for several programs that will boost the cause of motorcycling in and about the Quaker City.

THE Coffeyville (Kan.) M. C. has the honor of having a “factory man” as a member of the club, and is doubly proud of the fact. Z. Godin, representing the Hendee Manufacturing Company, recently joined the club ranks and is one of the city’s most consistent motorcycle boosters.

TOURING

TO SOUTHERN BATTLEFIELDS

L. C. MEREDITH.—Go from Mountain Lake Park to Deer Park, Altamont, Wilson, Bloomington, Westernport, Franklin, Phoenix, Barton, Moscow Mills, Pekin, Laconing, Gilmore, Paradise, Ocean, Upper Ocean, Borden and Frostburg. Distance 36 miles; roads good and level, with fine mountain section between Wilson and Bloomington. Join route 11 reversed at Frostburg to Hagerstown, Md. From Hagerstown go to Fiert Sid, Lappans, Mondel, Sharpsburg, Shepards town, W. Va., and Harpers Ferry. Distance 25 miles; fair to good hilly roads. Return over this route to Hagerstown and follow back on route 99 to Washington, D. C. From Washington take route 98 to 18.1 Fairfax, where take left road to Centerville and Manassas, 32.2 miles. Go on through Bristoe, Catlett, Calverton, Midland, Remington, Elkton, Brandy, Inlet into Culpepper. Distance Fairfax to Culpeper, 63.1 miles. Indifferent roads. At Culpeper reset odometer and continue on route 98 to Richmond.

From Louisa it is about a 20-mile run to Spottsylvania, through Cuzco, Mercersville, Glenora, Andrews, Margo and McHenry. Rejoin route given to Richmond. Take route 89, Richmond to Petersburg. City Point can be reached from Petersburg via Halfway house; country roads, somewhat over 10 miles. Take route 90, Richmond to Old Point Comfort; Williamsburg is on this route. From Williamsburg cross to Jamestown, then to south shore of James river and follow south bank to Claremont. From the latter place go south through Spring Grove, Savedge and Carsley (country roads) to Waverly, where join route 89 to Norfolk or Richmond. Distances are estimated between Williamsburg, Claremont and Waverly, 45 miles. Route not mapped.

TO MIDDLETOWN, N. Y.

HENRY J. PARRY.—From our Spring Touring Number, page 14, take route 34, New York to Delaware Water Gap. Use this route reversed: call 203.8 New York, the start and reach Denton; 57.9 miles out. Go on to 59.6 miles, when turn right at 3-corners. Middletown is 4.8 miles from Denton.

BOSTON TO BUFFALO.

E. M. GUEST.—Referring to our Spring Touring Number, take route 10, Boston to Pittsfield. From Pittsfield go to Albany, N. Y., over route 26 reversed. Take route 28 from Albany to Utica, and route 49 to Syracuse. From Syracuse take route 47 to Buffalo.

TO AND FROM BRETTON WOODS

CLIFFORD H. BISSELL.—1. Take the west shore route up the Hudson to Newburgh. 2. Turn off at Poughkeepsie to go to Pittsfield. Go from Fishkill Landing north to Poughkeepsie. 3. Take route 22 reversed from Brettton Woods to Portsmouth. It is

the only main and direct road to the coast. Wolfboro is reached from Ossipee, going southwest to Lake Wentworth and Lake Winnepesaukee. Turn right at 3-corners, Ossipee, go on to 6.2 miles, Wolfboro Center, and reach Wolfboro Falls next (9 miles). Wolfboro is 9.4 miles out of Ossipee. 4. We prefer route 37 to Lakewood and Asbury Park. 5. Take route 34 to Delaware Water Gap by preference.

DAYTON TO NEW YORK.

N. A. KREIDLER.—Follow back over route 133 to Columbus from Dayton. Take route 136 to Sandusky, then route 103 reversed to Cleveland. (For reversal of route see method in touring section, June 27 issue.) From Cleveland go to Erie, Pa., over route 138 reversed. From Erie go to Buffalo over route 29 reversed. From Buffalo take route 47 to Syracuse, reversing it. From Syracuse to Utica, see detailed route under separate cover. From Utica for Albany take first part of route 28 reversed. From Albany to New York, see routes under separate cover. This gives the best route from Albany to New York and should be taken reversed.

Ohio riders, when licensed, are exempt in New York State. At present there is no license necessary in the latter State for motorcyclists. Use the Blue Book, published by the Automobile Blue Book Co., and obtainable at any automobile supply house. Vol. 4 takes in the Middle West, and Vol. 1 New York and Canada.

LITTLE ROCK TO PONTIAC.

HOMER ADKINS.—Follow route 310 from Little Rock to Memphis, Tenn., taking the route reversed. Take route 311 to Sheffield, Ala., then route 314 reversed to Nashville, Tenn. From Nashville take route 313 to Mammoth Cave, Ky., then route 140 reversed to Louisville. From Louisville take route 129 reversed to Cincinnati, Ohio. Take route 128, Cincinnati to Lima, Ohio, following this by route 102 reversed to Cleveland.

From Cleveland take route 102 again to Lima, and then route 118 from Lima to South Bend, Ind. From South Bend take route 160 reversed to Chicago.

Pontiac can be reached from Detroit. From Lima take route 122 reversed to Toledo, then route 111 reversed to Detroit. From Detroit proceed as follows: Highland Park 5.0; Royal Oak 12.0; Birmingham 16.5; Pontiac 24.5 miles. Roads fine to fair, level with some gravel.

CINCINNATI TO CLEVELAND.

E. A. WHEELER.—See the Touring Number, page 32 for route 128, Cincinnati to Lima, Ohio. See page 28 for route 122, Toledo to Lima, which follow reversed. That is, call Lima 0.0; Beaver Dam 10.0, etc. From Toledo take route 104 (page 26) reversed to Cleveland.

THROUGH NEW ENGLAND FROM NEW YORK.

LUDWIG FLACH.—See route number 39, special Touring Number, New York to Hartford, via New Haven. Follow to Hartford. Next take route 13 to Worcester, Mass. Go to Boston over route 10 reversed. From Boston next take route 2 through Lowell and Manchester, to Concord, N. H. From Concord go to Hopkinton, then to West Hopkinton, Henniker, Hillsboro, Bennington, Hancock, Dublin and Marlboro to Keene. Distance 97.3 miles, fair to good dirt roads. From Keene go to Greenfield via West Swanzey, Westport, Winchester, Hinsdale, East Northfield, Northfield, and Bernards town. Fair to good dirt with a little macadam roads. Distance, 38.6 miles.

From Greenfield go to Springfield, Mass., via Deerfield, South Deerfield, Northampton, Mt. Tom, Holyoke. Roads macadam mostly. Distance, 37 miles. From Springfield join route 13 to Hartford and return to New York as you came out.

NEW FERRY SERVICE.

BROOKLYN, N. Y.—Long Island motorcyclists will appreciate the new Brooklyn-to-Staten Island ferry which was formally opened on July 3. This ferry service eliminates the long roundabout route formerly necessary to reach Staten Island. The "Garden City" will make daily trips at intervals of one hour from the foot of Bay Ridge avenue, Brooklyn, to St. George, Staten Island. The boat will leave Brooklyn on the hour and Staten Island on the half hour. The trip takes eighteen minutes. The ferry service was inaugurated by fifty members of the Bay Ridge Motorcycle Club making the first trip to Staten Island, where a spin was enjoyed.

USE OF CUT-OUT PROHIBITED.

THE touring department of the Automobile Club of America calls attention to the fact that the muffler cut-out ordinance for Greater New York, which was returned by the Mayor April 16, will become operative July 16, and it is believed that so many complaints have been made of unnecessary cut-out nuisances throughout all parts of the city, that the police will be active immediately after the new law takes effect.

A MUNICIPAL GARAGE.

COLUMBUS, OHIO.—The director of safety of Columbus has advertised for bids for the erection of a \$3,000 municipal garage to be located near police headquarters in which will be housed the automobile police patrols and the motorcycles used by the department.

The Barr Motorcycle Company, of Columbus, central Ohio distributor for the Indian, has delivered to the police department three 7 h. Indians to be used in chasing speeders.

A NORTH SHORE ROUTE.

MOTORCYCLISTS of the metropolitan district who have made the trip from the Queensboro bridge plaza to the north shore report that the best road is as follows: Turn left over good asphalt to car barns on right; short stretch of cobbles, then fair macadam through Broadway, rushing to Little Neck. From Little Neck the best road is to Manhasset, Cold Spring Harbor and Northport.

The extension of the Jericho Turnpike from Woodbury east has been opened, and is in good condition as far as Commack. Between Commack and Smithtown the road is still closed, and a short detour is necessary either to the north or south of the trunk road. For through travel this obviates the necessity of running to Cold Spring and Northport; thence through Kings Park to Smithtown.

Long Island Motor Parkway is open between its western terminus and Lake Ronkonkoma, where the Petit Trianon is open to the public. This is the route outlined in a recent bulletin issued by the Touring Bureau of the Automobile Club of America.

WHITE MOUNTAIN ROUTES.

MOTORCYCLISTS who have been over the Boston Post road to New Haven of late report that it is in poor condition, some stretches being extremely rough. From New Haven, however, nearly all the road is very good, through Springfield to Boston. From here it is mostly good macadam to Portsmouth, with some worn stretches.

The roads from Portsmouth to the White Mountains via the Weirs are in fair shape, but they are better via Ossipee and North Conway. If the tourist wishes to go from Portsmouth via Concord and the Weirs, or via Plymouth, the roads will be found good out to Concord via Barrington and Northwood Centre, except for a short stretch in the town of Epsom. From Concord to Plymouth or the Weirs they are fair for so early in the season. From Plymouth there are good gravel roads via Woodstock and the Profile House to Bretton Woods.

On the direct routes from Portsmouth via North Conway the roads are reported in good condition. Between Portsmouth and the Weirs, via Rochester and Alton Bay, the roads are in good shape only in sections.

UTOPIA SOCIAL RUN

Members of Brooklyn Club Enjoy Sunday Outing Over Fine Long Island Roads.

BROOKLYN, N. Y.—The first annual run of the Utopia Motorcycle Club of this city was held on Sunday, June 30, over some of the finest roads on Long Island. This was purely a pleasure trip, all of the features of an endurance run being eliminated. The schedule was an easy one, calling for 18 miles per hour. The route covered a distance of 125 miles. Checking stations were located at Eastern Parkway and Bushwick avenue for the start; Floral Park, Rockville Center, Mineola, Jericho, Massapequa, and at Patchogue, where the dinner stop was made. The return journey was over the Merrick road to Jamaica, then to Brooklyn, where the riders checked out.

There were 21 machines entered in the run, five of which did tandem duty. All of the machines finished on schedule time, thereby assuring the riders of handsome gold fobs. Barring one accident, none of the riders experienced anything worse than punctures. The accident was caused by an open trolley switch.

Captain Louis Decker, riding a 6 h. twin Flying Merkel, with Harry Wilkins as passenger, while passing through the town of Sayville, ran into the switch, which threw them from the machine. Decker was unhurt but Wilkins was not so fortunate. The glass on his goggles was broken, pieces of the glass cut his eye and six stitches were necessary.

Those who entered the run were as follows: John Behn, Merkel 6; Geo. Blaurock, Merkel 5; Otto Cody, Merkel 6; Herman Cordez, Merkel 7; Louis Decker (Capt.) and Harry Wilkins on tandem, Merkel 6; Ed. Daly, Merkel 6; Bill Erath, Merkel 6; Geo. Eckert, Merkel 6; Chas. Frenzel, Merkel 7; John Golz and Charlotte Klenschi on tandem, Merkel 4; Henry Juenger and Mrs. Juenger on tandem, Merkel 6; Ernest Keller, Merkel 4; Chas. Miles, Merkel 6; W. E. Murphy, Merkel 4; T. Monroe, Merkel 6; Willie Pflieger and Anna Pflieger on tandem, Merkel 6; Ed. Minden, Merkel 6; Ed. Steiger, Merkel 6; Harry Wiggins, Merkel 6; H. Wilkinson, Merkel 6.

The checkers of the course were Louis Decker, Charlie Keonig, Fred Williams, Bill Burkmen, Edwin C. Barhart, and Jimmy Frederick.

ALONG THE HUDSON.

RECENT reports obtained by the Touring Bureau of the Automobile Club of America are to the effect that 90 per cent. of the route up the Hudson river to Lake George is in excellent shape at this time, but tourists should take a few warnings in order to prevent meeting one or two bad stretches of road caused by reconstruction.

It is preferable to cross to the west side of the Hudson river by the 130th street ferry and run through Tuxedo rather than taking route on the east side by way of Tarrytown and cross there, as a hilly detour is necessary on this route between Nyack and West Nyack.

Going by way of Tuxedo a detour will be found necessary between Mahwah and Suffern. This is not posted, and travelers should be careful to turn left at Mahwah under the railroad bridge; turn right at the end of the road; pass a cemetery and turn right at the end of the road; cross a bridge and bear right under the railroad; at once bear left to Suffern.

From Suffern there is a fine road to Newburg, with the exception of about a mile.

At Newburg cross the Hudson on a ferry to Fishkill Landing. From here the route leads over nearly all State road to Poughkeepsie by way of Wappinger's Falls.

From Poughkeepsie to Hyde Park nearly all the distance is good macadam. On reaching Hyde Park at about 6.2 miles from the Poughkeepsie another detour is necessary. Turn right to East Park. Turn left at the end of the road and go straight on to the end of the road; turn right on to an excellent State road, and follow the same through Phinebeck, Red Hook, Blue Store and Hudson. Three miles from Hudson macadam is worn for a distance of about two miles, then the travel is over good macadam through Stockport, with a slightly rutty stretch entering Stuyvesant Falls. It is also rough and rutty for about one mile entering Kinderhook, and then good to Albany.

Leaving the Capital of the State, follow fair pavement, passing the State House and running on Northern Boulevard for about one mile. At the end of the Northern Boulevard there is good asphalt and brick and macadam through Cohoes, Waterford and Mechanicsville. Very good macadam to Saratoga.

Some of the Riders and Tandemites Who Went on the Utopia Club's Run.

APPLEBEE WINS SENIOR TROPHY RACE

Scott Rider Springs Surprise by Capturing English Classic on Two-stroke Machine; Bashall, Mounting 2 3-4 Douglas, Takes Junior Event—Rain Hampers Belt Drivers

By BRITISHER

SOME people pretend that motorcycle engineers can learn nothing from racing; but the 1912 Junior Tourist Trophy Race is likely to be famous in history as having affected a revolution in transmission designs. At first sight the race seemed a trumpery little affair. There were only 25 original entrants, and the list shrank to 20 starters on the race day. A trade abstinence bond debarred most of the crack trade jockeys from turning out; and on paper the trophy seemed to be a gift for the Humber Company, which won all the top places in 1911, getting their complete team of six riders through to the finish. Such unappetizing fare scarcely afforded sufficient inducement for our representatives to face the 80 miles of choppy sea which separate the island of tailless cats from the mainland. However, Fortune is a capricious jade, and as luck would have it, not one of the five Humber machines ever figured in the race or even finished as an "also ran," while the technical teaching of the race is so simple and direct that its influence will be visible on all the best British machines in 1913.

I will tease your speculative faculties no longer. Let me be brief. During the month prior to the race it had rained nearly every day, as it only can rain in Manxland, and especially did it pour all the day before the event. The race day itself opened fine, with sun and wind exerting miraculous influence on the sodden roads, but just as the first men started, a gigantic rainstorm burst, and in five minutes the entire course was streaming and shining with surface water. As a consequence, the belts were soon soaked, and every rider who was using a straight-through direct belt drive from engine pulley to rear wheel rim found himself in awful trouble, for rubber belts, when wet, slip over a steel pulley like a Wall street magnate over a banana skin. A few cute spirits had looped leather belts round their waists, and managed to struggle on until the wet stiffened the leather to the likeness of a poker, and the far-flung grit glazed the sides of the rawhide. Of those who had only rubber belts, the tale is soon told. Last year's winner stopped 17 times in 60 miles with a one-inch rubber belt, in perfect adjustment and condition, absolutely refusing to bite on his pulley. Another rider said that while his wheels had done one lap his engine had done three. At any rate the rain only lasted for two-thirds of the first lap, after which not another drop fell; but that half-hour's downpour destroyed the chances of all the direct-belt-driven machines; when the sun shone out again, not one of them had a dog's chance of finishing.

Chain-drivers were conspicuous by their absence, and so the British motorcycling public is not compelled to reconsider a transmission against which it is so strongly prejudiced. A type of transmission which is practically unknown in America, and which is yet to sweep the field in England, emerged from the strenuous conditions with superbly victorious credit. From start to

finish the victory lay within the grasp of the Douglas team. Now the Douglas engine, gearbox and details are no whit superior to those of several other premier 2 3-4 h. machines, the Humber for instance, but it was their transmission that primarily secured their triumph. The drive goes from the engine to a countershaft gearbox by a chain, which may be totally enclosed in a light aluminum shell of detachable type. Any reasonable gear-reduction can be obtained between the sprockets. This allows of a belt-pulley of as much as 8 inches in diameter being mounted on the countershaft, whence the drive is by belt to the normal pattern of wheel rim. The Douglas belts, thanks to their large countershaft pulleys, gripped like a chain or a propeller shaft.

It is positively certain that if the T. T. races are continued, practically every British machine that competes in future will have the combined drive; and it is probable that most of our best roadsters will adopt it for 1913. A revolution of transmission is in progress, and I should not hesitate to prophesy that the American industry, now coquetting between chains and belts, will profit by considering the combination. I stake my personal reputation on the historic importance of this scathing exposure of the direct belt drive, and on the certainty of the "combination" drive topping

our market against the best chain drive ever invented.

Result.	Machine.	Hr.	M.	Sec.	Speed.
1. W. H. Bashall	2 3-4 Douglas	3	46	59	39 m.p.h.
2. E. Kickham	2 3-4 Douglas	3	51	36	38 m.p.h.
3. H. Cox	2 3-4 Forward	4	6	29	36 m.p.h.
4. J. Stewart	2 3-4 Douglas	4	29	4	35 m.p.h.
5. P. Owen	2 3-4 Forward	4	31	54	35 m.p.h.
6. R. Ellis	2 3-4 Nut	4	32	26	33 m.p.h.

Five other riders finished in slower times.

Returns on the Senior Tourist Trophy event are not as yet complete, but the winner and second man are announced. F. A. Applebee, mounting a 3 1/2 h. two-stroke Scott, carried off the laurels, while J. R. Haswell, a private owner, came second on a 3 1/2 h. single belt-driven Triumph. The Senior race result was very surprising to most prophets; the Scott riders were looked on as possibilities only, but Applebee rode his water-cooled, side-by-side cylindered mount to victory with the Triumphs fighting him hard. Applebee's machine has two speeds, drop frame and chain drive, while the Triumphs were fitted with three-speed hub gears and V-belts.

BIG CAPITAL INCREASE.

COLUMBUS, Ohio.—The final steps in the merging of the Diamond Rubber Company with the B. F. Goodrich Company were taken recently when application was made with the secretary of State for permission to increase the capital stock of the latter corporation from \$45,000,000 to \$90,000,000.

HOT FINISH AT DENVER.

IN the accompanying photograph, showing a hot finish on the Tuileries saucer in Denver, Cox, mounting a Flying Merkel, has just nosed out Boyd, the Indian speedster. It is

worthy of note that Bowen, in third position on a Merkel, has ridden the last mile on a flat tire. Close finishes have been the order of the day at Denver for some time past, and the fans are showing their appreciation by turning out in large numbers to every meet.

QUESTIONS and ANSWERS

IN order to add interest and value to this Department, an entirely new feature was announced in the June 27 issue. The Editor will, as heretofore, answer all inquiries to the best of his ability. In addition, however, he will in each issue propose a question of his own, and invite the readers of *MOTORCYCLE ILLUSTRATED* to test their ingenuity and mechanical knowledge in answering them.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most thoroughly characterized by clearness, accuracy and brevity. A new question will appear

in each issue. Answers will be published the *second* issue following the number in which each question is asked. For example, answers to the question originally published in the June 27 issue, and repeated below, will be printed in the issue of July 25. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York."

Question No. 1.—Define, briefly and accurately, the general design and operation of a carburetor. Answers to this question will appear in the next issue.

Question No. 2.—Describe, so that a novice will understand, the construction and functions of a spark plug. Answers to this question will be published in the August 8th issue.

MERRITT

PATENT INFRINGEMENT.

PATENTEE.—The usual defense of an alleged infringer or of the defendant in such a case would be the lack of validity of one or more of the claims of the patent. Thus, if the device was manufactured in public, whether sold or not, at least two years before the patent was granted, the courts would hold that the claim of originality was valueless. If the device was described or mentioned in a periodical so that the nature thereof would be clear to the average mechanic over two years before the application for the patent, a ruling of like nature would also be made. Any patent to be valid must show originality in its application to the industries, if it is of the class under which yours comes, and this applies also to patents for processes (gold refining, mixing carbon with iron in certain proportions along with other metals or metalloids, etc.). If, however, the device were made in secret, and only the workmen necessary to the manufacture thereof were cognizant of its nature or manufacture, there could be no defense as to lack of originality.

In a patent specification, the claims are found near the beginning of the specification and also in full at the end thereof. But there is no bar at present to a patentee making claims which are only partially correct and true as to their originality. Thus, in a patent for a device forming part of a spring fork, the claims for the entire fork construction as a mechanism could be made, but the specific device (a link or rocker) only would be recognized as valid by the courts in a case of infringement, the other members being accessory thereto and having no weight as regards

originality. But in many cases, threat of suit for infringement has been sufficient to cause cessation of the parties said to be infringers from manufacturing or marketing the device without recourse to law. See a good patent lawyer.

MOTOR MANUFACTURERS.

STIERLE BROS.—Following are makers of motorcycle motors: Waverley Mfg. Co., Waverley place, Jefferson, Wis.; F. W. Spacke Machine Co., Indianapolis, Ind.; Shaw Mfg. Co., Dept. 26, Galesburg, Kans.; Aurora Automatic Machinery Co., Chicago, Ill.; Sun Motor & Supply Co., 307 Amsterdam avenue, New York. The R-S machine is made by the Reading-Standard Co., 306-340 Water street, lawyer, as the patent laws are, to say the least, rather complicated.

A PATTERSON BOOMER.

FRRIENDS of Dr. B. J. Patterson, of Rexford, Kan., are leaving nothing undone to boost him for the Federation presidency, and the letter printed below is indicative of the enthusiasm with which riders throughout his territory are looking forward to the Columbus convention. P. E. Zimmerman, F. A. M. commissioner at Lindsborg, Kan., writes as follows:

"A recent article referring to Dr. B. J. Patterson as the only avowed candidate for the office of president of the F. A. M. was good news to that part of America situated west of the Hudson river, as it was in such marked contrast to the attitude of one of the Eastern motorcycle

journals which referred to the doctor's candidacy as 'something local,' intimating that it was confined to the prairies of Kansas.

"The fact of the matter is that Dr. Patterson, by every line of reasoning and system of logic, is the logical man to head this great organization. He has no ax to grind; has done more for the F. A. M. than possibly any other man in it, and it has been strictly a labor of love on his part. He is the very exemplification of unselfishness; and if there is any place on earth where such a qualification is imperative, it is the presidency of the F. A. M.

"Dr. Patterson is no uncertain quantity. He is time-tried and tested. And the big things he has done make him tower head and shoulders above the ordinary aspirant for the executive position. If left to an open vote of the riders of America, the result would be certain.

"Here's hoping that all the good scouts from Chicago, Los Angeles, Savannah, Denver, Rochester, Columbus and other great motorcycle centers get behind the candidacy of Dr. Patterson at that Columbus convention, and boost him into the presidency, where he belongs by all the traditions of the game."

IOWA GOOD ROADS SCHEME.

DES MOINES, Iowa.—The Polk County Good Roads Club, of this city, is adopting a novel plan to get the roads in better condition. Membership costs \$2, and every member is given a small, round shield to wear on the front of his machine.

A VISIT TO THE HOME OF THE DE LUXE MOTORCYCLE MOTOR

By A Staff Correspondent

HAVING seen and heard so much of the De Luxe motorcycle motors, I was desirous of knowing, at first hand, something of the factory and the manufacturing methods used in the making of these motors, and on a recent visit to Indianapolis I visited the plant of the F. W. Spacke Machine Co. I had no letter of introduction, but found these people easy of access. When my mission was learned I was turned over to a gentleman who showed me the plant in a very thorough fashion, and I will endeavor to give my general impressions of the visit.

In the first place, as a matter, perhaps, of historical interest, the F. W. Spacke Machine Co. has been engaged in the manufacture of automobile motors and automobile motor parts ever since self-propelled vehicles have been known. The company therefore has a plant and organization second to none for the turning out of the high-class work necessary to make a successful motorcycle motor, and at the same time their facilities are such that they are able to produce these motors in large quantities. The factory is one of the most compactly arranged and complete plants I have ever seen. Only the most modern and the highest class of machine tool equipment is used, such as massive grinding machines for inside, outside and flat grinding and accurate gear hobbing machines for generating the teeth of gears. The equipment of this factory consists of a total of three hundred machine tools.

The working conditions in this factory are up to the highest standard of present-day successful manufacturing, as great care is taken to provide the men with comfortable surroundings and every reasonable precaution for safety

in their work. The result is that this factory reminds one of a bee-hive wherein everybody is working to their utmost to do their part in the making of De Luxe motors.

The work of manufacturing is carefully scheduled from the initial operations on the raw materials to the final inspection and exhaustive block tests of the finished product. The raw materials are first received in the spacious receiving department where they are checked in and carefully inspected to see if they are up to the high standard set for material entering into De Luxe motors. From this department the material is taken to the various manufacturing departments, and every step of this journey is carefully watched to see that the quality is properly maintained. In the manufacture of a particular product, such as a motorcycle motor, many high-grade methods are introduced and I notice that these people finish all parts wherever possible by grinding. This is not only an economical way of manufacturing, but means that all such parts are more accurately finished and better finished.

Another point of interest to me was the method employed in the cutting of the spiral timing gears used on this motor. Not only are blanks for these gears ground to correct outside diameter, but they are also cut on self-generating automatic gear hobbing machines. The function of these gear cutters is to accurately generate the form of the gear tooth, which means that De Luxe gears are theoretically as well as practically correct. Then, too, the grinding of cylinders, pistons, piston rings and piston pins are interesting processes, and it will surprise any one to know the extreme closeness of size to which

all of these parts are made. In fact, in all of this manufacture an extensive system of jigs is used as well as close size limits maintained and the result is that the De Luxe motors are entirely interchangeable. The photographs accompanying this article represent partial views of the manufacturing departments of this factory.

From the manufacturing section all parts, after proper inspection, are taken to the various assembling divisions as noted by the other photographic illustrations. The departments are very extensive. Here the motors are put together by skilled men, and after they have been carefully adjusted the motors are delivered to the testing department. Upon coming to this division of the factory, I was first impressed by the terrific din, due to the open exhausts, which greeted my ears and the thought that such a place would be a heaven for the open muffler fiend. There is, however, a reason for this noise as by this means any inaccuracy in motor explosion or operation is detected.

Before the motors are given their power tests they are run by belt power so as to limber them up. After an extensive "limbering up" run the motors are mounted on a stand for power tests. In order to determine that these motors are properly producing their full power capacity, they are connected to an electrical dynamometer which is nothing more or less than an electrical generator provided with a suitable means for recording the horsepower developed. During a long period of power operation a continuous reading is taken of the horsepower output of each motor. Every motor must show a uniform power development which, of course, is far in excess

of the normal rating of the motor. Each motor is run under power tests with a magneto, carburetor and spark plug with which it is shipped and thus, when a motor leaves this factory, it is properly adjusted and ready to run without further change.

After each motor receives its test O. K. it is taken to the inspection department for final examination and approval. From the inspection department the motor goes to the shipping room, where it is carefully wrapped in a cotton sack and then, in turn, packed in a closed box surrounded by excelsior. This insures that the customer will receive a motor entirely free from damage to the fine adjustments necessary for its successful operation. Another thing which impressed me was the scientific methods employed by the F. W. Spacke Machine Co. in putting out De Luxe motors. Their engineering department is constantly figuring and experimenting with the various phases of motor operation, with the result that they have established a comprehensive list of tables showing the horsepower outputs of these motors under all conditions, their torque and various other things of scientific interest. In fact, the F. W. Spacke Machine Co. has brought to bear in the production of these motors all of their knowledge as gasoline motor experts, and it is not at all surprising to me that they have achieved such marked success.

With their large facilities, they are figuring

motorcycle motor manufacturing plant in the country.

SPEAKING OF ADVERTISING.

WITH Excelsior agents on all sides pleading for rush shipments of machines, Advertising Manager Aleck G. Whitfield, of the Excelsior Motor Manufacturing and Supply Company, has the best of reasons for knowing that publicity in behalf of a reliable product is the breath of business life, but that doesn't prevent him from making some straight-from-the-shoulder remarks anent the type of advertising which fires a broadside of adjectives regardless of facts.

"Reasonable advertising should be encouraged by every legitimate means," says Mr. Whitfield, "but whether a man is boosting a motorcycle or a steamship he should have facts to present—and present them. The buying public, on the other hand, should expect these facts and demand them. In all lines most of us must plead guilty to a hungering for the greatest possible returns with the least expenditure, but even this tendency should not lead us beyond the bounds of reason. There must be a limit to our credulity lest we go to the extreme of enthusing over a more or less humorous motor description which recently appeared in *Gas Review*.

The author of the article referred to was dwelling upon "A Mistake of Advertisers"

when he wrote as follows: "They tell us that a certain engine will do all our work and take care of itself; that it needs no foundation to stand on; that any convenient snowbank will do, and, if that is not handy, it will do its work resting upon the hot air of the advertisement which sold it; that it requires no attention beyond a half-hitch at the fly-wheel once or twice in two or three weeks, and a quart can of good engine oil set on the windward side of it; that the only fuel required is an occasional whiff of alcohol fumes from its owner's breath; that no repairs are ever needed and that the only engineer required is a babe in arms or a schoolgirl."

PETITION FOR EXTENSION.

CREDITORS of the Pierce Cycle Company, of Buffalo, N. Y., have received notice that Lawrence P. Hancock, trustee of the company, has filed a petition requesting that an order be made to continue the business in the ordinary course of trade for not more than sixty days from June 10. The petition is in the hands of Referee Barber B. Conable.

HOW THE BOOM GROWS.

THAT there has been no falling off in the motorcycle boom, which is now sweeping the country, is evidenced by a

Assembly Room.

on a big production for the forthcoming season, and they tell me that this output is, at this early stage, practically sold. De Luxe motorcycle motors are being built in four sizes: 4 h. single cylinder, 5 h. single cylinder, 7 h. twin cylinder and the large 9 h. twin special motor which has attracted so much attention.

Little did I know when I entered this plant, of the vast detail and energy devoted to the manufacture of motorcycle motors, but I now have a new and accurate conception of the largest and most up-to-date

Assembly Room.

recent report from the Hendee Manufacturing Company. The Wigwam officials opened the season by counting upon a demand for about 13,000 Indian machines, and up to the evening of June 29 the actual delivery of Indians was a trifle over 15,000 machines. In other words, the sales had run 2,000 machines beyond the outside estimate of the company, with the season only about half gone. The Hendee company states that its orders are piling up as rapidly now as they did during the spring.

Testing Department, F. W. Spacke Motor Co.

NEW BOSCH FACTORY ON MODEL LINES

Big Springfield Plant, Designed to House 1,000 Workers, Has Every Improvement Calculated to Increase Efficiency and Comfort of Its Magneto Experts—Nucleus of Mammoth Establishment.

L AID out along lines which insure economy in operation, a perfect system of collaboration in the various departments and a wonderfully comprehensive policy as to tests and inspections, the new factory of the Bosch Magneto Co., just finished at Springfield, Mass., stands as substantial proof of the firm's claim that its establishment as well as its products must rank high. In the buildings now constructed one thousand workers will be surrounded with conditions such as to enable them to give their skill its best expression and to produce only such work as will be in keeping with Bosch standards. Carefully prepared schemes for heating, ventilating, sanitation and general efficiency have been worked out by those who planned the structures so that absolute order and cleanliness will automatically prevail. Nor were the arrangements limited to present needs, but on the contrary the buildings now in use are but the nucleus for a prospective group that will house more than three thousand workers.

The site is on North Main street in the city of Springfield, the home of several active automobile enterprises, and is so located that the factory has direct rail connection, by means of a side track of the Boston & Maine Railroad, with the railroads of the country. In addition to the main or manufacturing building the buildings now erected include a power house and boiler house in addition to a number of small temporary ones. The manufacturing building is of a cross shape plan with four stories, each 13 feet 6 inches high, and contains the shops and factory offices. It is 315 feet long and 66 feet deep with the length extending north and south on Main street.

The east or front section, setting at right angles to the length of the building, houses the main entrance, main stairway and toilets, while the west or rear section contains the wash rooms and locker rooms. The intention is to add one wing extending from east to west on each end of the main building and to complete the square with a building similar to that now erected. In that way the buildings will form a large block with two light courts. The buildings are of reinforced concrete construction.

The machine tools are arranged for group drive. The mainshafts are about 60 feet long, each being driven by an induction motor of 10, 15 or 20 h. The power for the motors is transmitted by a 2-phase, 4-wire, 60-cycle, 440-volt system. Located in the power house is a private power plant in the course of erection, consisting of a 280 h. Diesel engine connected to a 200 K. W. Westinghouse generator which will furnish current for both power and light. When this plant is completed it is intended to use the present outside supply as a reserve.

The high tension cables of the electric light company do not enter the main building, the current being transformed from 5,400 volts to 440 volts by oil transformers, placed in a small building near North Main street. The current is carried by cables from there through the underground conduits of the main building into the power house where the central switch-board for power and light is located. The photographs herewith show (1) A general view of the new factory; (2) a typical floor plan, and (3) a section of the parts manufacturing department.

MANUFACTURERS

SETTING LIVELY PACE.

SO broad has been the demand for the attractive new catalog of the Chicago Cycle Supply Co. that the first edition, which was expected to cover the entire dealers' list, has already been exhausted, and it has been found necessary to have 2,000 extra catalogs printed. What's more the catalogs are bringing returns. President Hanson reports that the factory staff has been working in special shifts on nights and Sundays for some time past to keep abreast of the orders. The extra floor which the company intended to rent when it first occupied the building is now needed for the firm's own business so rapidly has it expanded of late.

H. E. Kenyon, formerly connected with the Excelsior Motor Manufacturing & Supply Co., is now with the Chicago Cycle Supply Co. as assistant to President Hanson, and Mr. Ash, formerly with the Hine Watt Co., of Chicago, has been taken on as a traveling representative in Western territory.

TWO EXTRA STORIES.

DESPITE the fact that an extensive addition was made to the Hendee Manufacturing Company's plant in Springfield last winter, it has been found impossible to keep abreast of orders for Indian machines, and as a result further additions are now being made to factory No. 3 of the big plant. The present building is three stories high, and two extra stories are to be placed upon the entire structure. Two large towers are also new; the larger one accommodates a freight elevator and stairways, and the smaller tower has lavatories on five floors and a large protected tank in the sixth story. These improvements will add over 20,000 square feet to the building's floor space.

EXTENSIONS NEEDED.

NEW equipment recently installed in the spacious factory of the Empire Tire Company at Trenton, N. J., will permit the company to more than double its output. A large force of tire experts is now working at top speed to meet the demand for Empire products. President Charles H. Semple is well remembered by all the veteran bicycle and motorcycle riders in this country, as he has been an enthusiastic booster of the two-wheeler, motor or no motor.

A BIG MOTOR ORDER.

THE Great Western Manufacturing Co., of La Porte, Ind., has placed an order for 1,000 Spacke motors. The company contemplates manufacturing motorcycles for 1913, and it is understood that a formal announcement of its plans will soon be made.

BIG GOODYEAR ADDITIONS

Will Increase Capacity of the Already Extensive Plant from 5,000 to 8,000 Tires a Day.

EXCAVATIONS are being made for another monster building at the Goodyear Tire & Rubber Company's plant, Akron, Ohio. This addition to the present great factory group will be 400 feet long and 80 feet wide. It will be six stories high, with basement, and will be made as nearly fireproof as possible. The Goodyear company is also adding two stories to two of the present buildings. Each of these buildings is 450 feet long and 60 feet wide. The new buildings and the two new stories will give the plant additional floor space of 266,000 feet, making in all a total floor space of 1,266,000 square feet.

The additions and the new building are being erected for the purpose of taking care of the increase of the tire business, and the enormous output of Goodyear No-Rim-Cut tires and other popular lines. At the present time the Goodyear Tire & Rubber Company is turning out 5,000 tires a day; the new buildings will enable the company to turn out 8,000 a day.

The company employs 5,000 men, but when the new buildings are completed employment will be found for 2,000 additional hands.

VISITORS AT MERKEL PLANT.

AMONG recent visitors at the plant of the Miami Cycle and Manufacturing Company in Middletown, Ohio, were A. C. Edwards and Lawrence Kunle, who rode down from Columbus on their Merkel sixes; George Reisinger, of Anderson, Ind., who made the trip to Middletown on his belt-driven Merkel 6; Gomer Walters and John Walters, of Buffalo; A. D. Rivers, of Toledo; T. E. Johnson, of Lima; F. McCarthy, of Detroit; William G. Pierce, of St. Louis; Orvis K. Newby, of Kansas City, and John E. Merz, of Indianapolis. Merz rode down from Indianapolis in the early morning hours, covering the distance of about 100 miles in less than four hours.

THE "SILVER LINING."

THAT the old adage with reference to clouds and silver linings is not without modern applicability is proved by the recent experience of President Heitger, of the Heitger Carburetor Company, of Indianapolis. After a sojourn in a hospital following an operation for appendicitis Mr. Heitger returned home to be greeted by a brand new baby which arrived at the Heitger residence on Sunday, June 23. It goes without saying that the head of the well-known carburetor firm at once became a cheerful convalescent.

"ALIVE WIRE" STILL BUSY.

FOLKS throughout the country who keep a business eye on the newspapers and magazine these days—and there is a mighty big family of us, by the way—are getting so well acquainted with Alive Wire, the advertising philosopher who figures in the publicity campaign of the Miami Cycle & Mfg. Co., that they would no doubt feel a bit lonesome without him. Just where Alive Wire "lives, breathes and has his being" is a small matter; the fact remains that he is whooping along joyously, turning up in print regularly, delivering straight-from-the-shoulder business arguments and getting results. He is never without something to say anent Flying Merkel motorcycles and that he says it interestingly and convincingly is evidenced by the number of his friends. Alive Wire is a booster, coming and going, as his name implies, and when not talking Flying Merkel machines exclu-

sively he is booming motorcycles in general. His headquarters is at the Herbert M. Morris Advertising Agency, in Philadelphia, Pa., but he does not consider it an unusual performance to whoop things up in the print of half a hundred newspapers and magazines all over the country on the same day. In the accompanying illustration he is merely calling attention to the fact that he is still "in the ring."

AN attractive catalog, telling the story of Simplex side-cars, is now ready for distribution by the Simplex Machine Co., of Forty-sixth street and Sixth avenue, Brooklyn, N. Y.

SHIPPING FIRST TRIUMPHS

Recently Organized Detroit Company Swings Its Plant into Operation in Record Time.

THE Triumph Manufacturing Company, of Detroit, organized last April for the production of the Triumph motorcycle, has made such splendid progress in the innumerable details of factory organization that the first machines will be shipped this coming week. Two thousand motorcycles are now passing through the busy plant at 51-55 East Woodbridge street, in lots of fifty, and within a few days dealers throughout the country will be receiving their first allotments. To bring this about the men at the head of the company have been working night and day for several weeks, and they now feel that they can almost take a long breath. The establishment of an entirely new plant, the installation of machinery, the gathering of tools and supplies, the details of factory organization and sales plans combine to make a large undertaking; but the task has been achieved successfully in record time.

The officers of the Triumph Manufacturing Company are: President, Robert M. Brownson; vice-president, C. C. Wormer; Muir B. Duffield, secretary; and George W. Sherman, treasurer. Mr. Brownson and Mr. Sherman are men of vast practical experience in the automobile and motorcycle business.

The Triumph Company is turning out two types of motorcycles, a single cylinder one-speed model and a two-speed model. The first develops $5\frac{1}{2}$ horsepower; the second model gives 10 horsepower to use where the going is rough and the hills are steep. The first is equipped with pedals; the second is equipped with running boards instead of pedals and is started and controlled like an automobile. Both feature a special and exclusive type of front forks and a "no jolt" seat which is covered by broad basic patents. The Triumph includes a Bosch armored type magneto. The $5\frac{1}{2}$ h. motor has a bore of $3\frac{1}{4}$ inches and a stroke of $4\frac{1}{4}$ inches. The two-speed model is of the planetary type, and has no gears working on the high speed.

A LIVELY JERSEYITE.

NORMAN E. HEIL, Flying Merkel agent in Paterson, N. J., and one of the liveliest motorcycle boosters in and about the New Jersey city, recently managed to remain in a given spot long enough for a camera man

Norman E. Heil.

to snap him. The picture reproduced herewith is the outcome. In addition to being an enthusiastic agent, Heil is a consistent pluggier in endurance runs and seldom misses one in his section of the State. In the endurance contest of the North Jersey M. C., of Paterson, on June 24, Heil carried a lady passenger on his tandem attachment and went through with a perfect score. Harvey Snyder and W. Heil, two other Merkel riders of Paterson, also scored perfectly.

PIONEER MONUMENT.

THE center of the motorcycle trade in Denver. The Flanders agency is directly across the street; Thor, a half block south; Indian, one block north; Excelsior, one block south; Merkel, three blocks north; Pope and Pierce, one and one-half blocks north.

DENVER TRADE NEWS.

W. E. JOHNSTON, manager of the local Hendee Mfg. Co. branch, has just returned from a visit to the factory. He was successful in securing the shipment of a number of machines to the Denver branch, but on his return he found that the boys he had left in charge of the establishment had disposed of all the new machines.

The Pettie Cycle Co. has taken the agency for Pierce and Pope motorcycles and reports that "the game looks good."

The Carstarphen Electric Co. has opened an agency for the Flanders, placing Harry Good, the motorcycle racer, in charge.

Walter Whiting, Harley-Davidson agent, has racing aspirations and is fitting up a ported seven, which will be ridden by Curly Fredericks.

Old Man Brown, a veteran of the game, and Denver agent for the Merkel, states that sales are fine, but that shipments are a bit slow.

Fred Williams, Thor agent, has not yet received a 1912 model, but expects to get in a few during the next week.

The Emblem agency in the far northern part of the city and the New Era agency in the extreme southern portion are making steady sales.

NEW MANAGER NAMED.

SIX hundred employees of the Aurora Automatic Machinery Company, of Aurora, Ill., and their foremen, who left the plant on Monday, July 8, because of the reinstatement of former Manager Daniel E. Cary, returned to work on Tuesday after Cary had resigned. The men who quit compose the entire day force at the plant.

Mr. Cary was reinstated at the request of former Mayor John P. Hopkins, of Chicago. As soon as it became known that he would assume charge of the plant again, First Vice-President E. N. Hurley tendered his resignation and the men prepared to go on strike. At the conference which followed Cary withdrew and J. D. Hurley, a brother of First Vice-President Hurley, was placed in charge. The big factory is again working at full blast, very little time having been lost through the action of the force.

EBY TO MAKE CEMENT.

HENRY E. EBY, JR., of Fernwood, Pa., sole owner of the formula for the rubber cement in tubes formerly sold under the name of "Quality Rubber Cement," has gone into business for himself and will market this product as Globe Rubber Cement.

ASH JOINS THE RANKS.

SECRETARY JAMES W. ASH, of the Miami Cycle & Manufacturing Co., can ride as well as sell a motorcycle, and he gets as much enjoyment out of one occupation as the other. The accompanying photograph shows him with the machine on which he recently broke into the ranks of single-tracker enthusiasts. Mr. Ash is a veteran bicyclist, but it was only recently that he decided to operate his own motorcycle.

James W. Ash.

MOTORCYCLISTS of Troy, N. Y., rode to Cortland in a body on July 4 where several of their speedsters participated in the races held under the auspices of the Cortland M. C.

Two Interior Views of B. A. Swenson's New Indian Wigwam in Providence, R. I.

A PRACTICAL SUGGESTION.

WASHINGTON, D. C.—W. F. Throop, agent for Haverford machines and one of the best known Washington motorcycle dealers, has his own idea of the proposed action of the post office department in substituting motorcycles for horses and wagons in the collection of mails for the larger post offices of the country. Mr. Throop does not believe this plan will prove entirely successful until the department arranges to have its own repair shops, with a competent man in charge at each post office, and one or two extra machines for emergency use.

As he sees it, the average mail collector who owns his own machine will be inclined, after attending to his postal duties, to use the motorcycle for pleasure purposes and thus subject it to considerable wear and tear, so that in time it might cause trouble. Then, unless a mechanic were available to make repairs and another machine were on hand for immediate use, the mail collection would be apt to suffer, the post master would be out of sorts, and the motorcycle would be blamed.

JENKINS' FINE DES MOINES PLACE.

THIS is the handsome new home of Jenkins & Co., Iowa agents for the Excelsior and Indian. The new building is 50 by 82 feet. Of the total floor space, Jenkins & Co. use 6,600 square feet for show room, garage, offices and repair shops. The building is located at Twelfth and Locust streets, Des Moines, Iowa. The club rooms of the Des Moines Motorcycle Club are on the second floor. F. R. Jenkins, president of Jenkins & Co., and State F. A. M. commissioner, is promoter of the new building. It is one of the finest exclusive motorcycle structures in the United States, and the Des Moines motorcyclists are duly proud of it.

IN MORE SPACIOUS QUARTERS.

FINDING its old quarters unequal to the demands of a rapidly growing business, the California Motorcycle Company, of Los Angeles, Cal., has moved from the corner of Sixteenth and Hill streets to a spacious store at 818 South Main street, within a few blocks of the center of motorcycle activity in the city. The California company handles Eagle and M.-M. machines, and in its new quarters a fully equipped machine shop will be an important feature. In addition to doing repair work the company intends to manufacture a few light motorcycle accessories.

Andrew Lardino's F. A. M. Repair Shop in Jersey City.

REGISTERED SHOPS.

CHAIRMAN ESTABROOK, of the F. A. M. membership committee, reports late additions to the list of registered repair shops as follows: O. & D. Motor Company, 809 Allen street, Boone, Ia.; Solt-Frederick Auto Garage, North Carroll street, Frederick, Md.; Brandenburg & Miller, 228 West King street, Martinsburg, W. Va.; Roscoe N. St. John, 914 Maple street, Rocky Ford, Col.; S. Page, Jr., Waverly, Ia.; E. S. Henderson, 153 Thacher street, Hornell, N. Y.; A. E. Sherwin & Co., 212 North Main street, Goshen, Ind.; Alliance Motor & Supply Company, First National Bank building, Alliance, O.

HARLEY-DAVIDSON STOLEN.

HAGEDORN & WEBSTER, of 206 East Jefferson boulevard, South Bend, Ind., report the theft of a 1912 Harley-Davidson machine from their headquarters. The machine is a battery model, fitted with Troxel saddle, Empire checkered tread tires and engine No. 5178-B. When stolen it was equipped with a nicked Simplex spring carrier. A reward of \$25 is offered for the recovery of the machine.

BYERLY IS ASSISTANT MANAGER.

GUS HABICH has appointed Alex Byerly, former manager of his motorcycle department, as assistant manager of the concern. On July 1 Habich sold two 7 Excelsiors to the Indianapolis Police Department for the motorcycle squad.

J. M. GROSSMITH, J. cashier of the Excelsior Motor Manufacturing & Supply Co., was stricken suddenly with appendicitis while at his duties recently, and an operation was necessary. He has now almost entirely recovered. Mr. Grossmith is one of the few identified with the new Excelsior Company who were also connected with the old firm.

ANOTHER TRACK RECORD

Hung Up by Otto Frykman on Hamline Course in Minneapolis Last Week.

MINNEAPOLIS, Minn.—Daring riding by Ray Porter and Otto Frykman featured the races held July 6 on the Hamline race track in this city under the auspices of the Minneapolis Motorcycle Club. One track record was lowered when Otto Frykman, on an Indian, covered a mile in 55½ seconds, breaking the record formerly held by Harvey Barnard, of Milwaukee, made two years ago on a Harley-Davidson, of 56 flat. Unfavorable weather conditions had put the track in bad condition.

Frykman and Porter, on Indians, furnished the most excitement of the afternoon in the fifteen-mile contest, in which seven riders competed. Frykman jumped to the front at the start and held that position till the sixth lap, when Porter caught up with him and the two fought it out for first place for the next three laps, Porter finally sprinting away in the tenth lap. He was never headed after that. His time for the fifteen miles was 14:33½.

In the one-mile time trial, on his first time around, Ray Porter nearly equaled the track record of 56. He was followed by Frykman, who first made the distance in 57¾ seconds and then succeeded in hanging up a new record on his second trial by covering the ground in 55½ seconds. Summaries:

Three-mile race for novices.—First, Irwin Embickson, Harley-Davidson; second, Frank Low, Harley-Davidson; third, Jerry Miller, Excelsior; time, 3:47½.

Five-mile race, 54 cu. in. limit; stripped stock machines.—First, Ray Porter, 4 Indian; second, Ed Hammer, 7 Indian; third, C. C. Gould, Thor; time, 5:46½.

Five-mile, free-for-all.—First, Otto Frykman, Indian; second, Ray Porter, Indian; third, Ed Hammer, Indian; time, 5:01½.

Five miles for private owners, 30.50 cu. in. limit.—First, Frank Low, Harley-Davidson; second, Charles Boyer, Wagner; third, Carl Peavey, Thiem; time, 6:10½.

One-mile time trials for track record.—Otto Frykman, Indian, :55½; Ray Porter, Indian, :56¾; Joseph Shimak, Indian, :56¾; Tom Miller, :56¾.

Five-mile free-for-all, 30.50 cu. in. limit.—First, Ed Hammer, Indian; second, C. C. Gould, Thor; third, Irwin Embickson, Harley-Davidson; time, 5:45.

Three-mile free-for-all.—First, Ray Porter, Indian; second, Otto Frykman, Indian; third, Tom Milton, Indian; time, 2:59½.

Ten-mile race for private owners.—First, Tom Milton, Indian; second, Louis Gerber, Indian; third, Fred Lussier, Excelsior; time, 10:14½.

Fifteen-mile free-for-all.—First Ray Porter, Indian; second, Otto Frykman, 7 Indian; third, Ed Hammer, 7 Indian; time, 14:35½.

Three-mile race, 61 cu. in. limit, stripped stock machines.—First, Ray Porter, 7 Indian; second, Tom Milton, 7 Indian; third, Joseph Shimak, 7 Indian; time, 3:03.

Referee, William Edwards. Judges, N. A. Frykman, P. G. Nichoff, S. Berkmyer. Timers, A. J. Ludwig, G. H. Riebeth, J. W. Trumble. Starter, Tom Bird.

RICHMOND RACES.

FOLLOWING are the results of the race meet held by the Old Dominion Motorcycle Club, Richmond, Va., July 4:

Three-mile novice, 30.50 class.—First, Fletcher, 4:32; second, D. Catonni, 4:35; third, Sapere, 4:36.

Five-mile club championship, 30.50 class.—Won by Fletcher, 7:15.

Five-mile club championship, 61.00 class.—Won by Bivins, 6:20.

Five miles, 30.50 class, open.—First, Philnots, 7:01; second, Bivins, 7:15; third, Fletcher, 7:17.

Five miles, 61.00 class, open.—First, Hines, 6:04; second, Bivins, 6:05; third, Suttle, 6:07.

Ten-mile handicap, open.—First, Bivins, 12:49; second, Hines, 13:39; third, Lenz, 13:50.

Match race, in three heats, between Hines and Lenz.—First two heats won by Hines. Time, 3:14 and 3:18, respectively.

The mile track was very heavy on the curves, which was a serious handicap. The sensational riding of Bivins and Hines was the features of the day. Fletcher, a novice, also lead in his class.

FATAL CRASH AT CLEVELAND.

CLEVELAND, June 30.—Racing tonight was brought to a sad end when Bob Hunter, of Newark, N. J., a professional rider, was instantly killed in a collision with Finn Huttering. The accident occurred in the second heat of the three-cornered two-mile professional match between Huttering, Hunter and Buzz Knapp. They were on the third lap and well bunched, Huttering leading, Knapp second and Hunter third. Knapp overtook Huttering and passed him and Huttering rubbed Knapp's rear wheel, throwing Huttering up the track directly in front of Hunter. Hunter saw Huttering fall and was seen to shoot up the track like a bullet; thousands of spectators sprang to their feet in horror as Hunter smashed into a lamppost at the top of the saucer. Huttering had spun around on the track with his machine and then jumped, after first doubling himself up in a knot, and his machine collided with Hunter and his machine for the second time. The machines rolled down the steep incline upon the ill-fated Hunter and difficulty was experienced in shutting the racing motors off. All that saved Huttering from death was the fact that when thrown from his machine he doubled up with hands over his head and turned somersault after somersault down the incline. Summaries:

Three miles, amateurs, for 7 h. stock machines.—Roehl (Indian), Henikman (Indian), Norton (Indian); time, 2:54.

First heat, three-mile three-cornered match race.—Knapp (Indian), Huttering (Indian), Hunter (Indian); time, 1:29½. Second heat stopped at second mile account of accident.

Four-mile invitation professional.—Gibson (Indian), Seliga (Indian), Carslake (Indian); time, 2:57½.

Time trials for two-mile track record.—Smiley breaks record; time, 1:25½; Gibson, 1:28; Standen, 1:30; Seliga was flagged account of break in track.

Five-mile free-for-all professional.—Gibson (Indian), Knapp (Indian), Smiley (Indian); time, 3:45½.

GIBSON A WINNER.

CLEVELAND, June 29.—Wylie Gibson, of Lorain, Ohio, came into his own last night at the motordrome and won both races in which he was entered, the three and five-mile events. Frank Seliga was the only man who could keep up with Gibson and he was away in the rear at the tape. Carslake was entered in the five-mile event and had a hard time to keep from being lapped. His machine did not seem to be rolling. Summaries:

Three miles, amateurs, 7 h. stock machines.—Roehl (Indian), Henikman (Indian); time, 2:55½.

First heat of two-mile match race for best two out of three heats.—Carslake (Indian), Smiley (Indian); time, 1:32. Second heat, Smiley (Indian), Carslake (Indian); time, 1:31. Final, Carslake (Indian), Smiley (Indian); time 1:29.

Three-mile invitation, professional.—Gibson (Indian), first; Seliga (Indian); Standen (Indian); time, 2:14½.

First heat five-mile free-for-all, professional.—Gibson (Indian), Carslake (Indian), Standen (Indian); time, 1:29. Second heat, Seliga (Indian), Knapp (Indian), Hunter (Indian); time, 1:29½. Final, Gibson (Indian), Seliga (Indian), Knapp (Indian); time, 3:48½.

RIVERVIEW RACES.

CHICAGO, July 5.—In the absence of Ray Seymour and Morton Graves, Joe Wolters and Chas. Balke had things their own way in the July 4 races at Riverview. Summaries:

Nine-mile professional match race between Joe Wolters and Balke, three-mile heats.—First heat won by Wolters in 2:10; Balke won second heat in 2:11½ and third heat in 2:11½.

Nine-mile invitation professional race, three-mile heats.—Dave Kevnie, first; Wm. Samuelson, second; time, 2:15. Second heat, Theodore Samuelson, first; Wm. Samuelson, second; time, 2:17½. Final heat, Wm. Samuelson, first; Theodore Samuelson, second; Court Edwards, third; time, 2:16½.

Four miles, for amateurs.—Peter Wenk, first; Ed Bethke, second; J. T. Traftsky, third; time, 4:14.

Ravenswood Sweepstakes, free-for-all, six miles.—Joe Wolters, first; Balke, second; Wm. Samuelson, third; time, 4:22½.

BIG LANTERN PARADE

Motorcyclists, Automobilists and Bicyclists Will Figure in New York Program on July 24.

WHAT promises to be the largest and most novel affair of its kind ever held will take place in New York and Brooklyn on Wednesday evening, July 24, in the form of a monster lantern parade of motorcycles, bicycles and automobiles, under the auspices of the United Cyclists. There will be music, red fire and fireworks and from the interest already shown with the announcement but a few days old, enthusiasm aplenty will not be missing. All riders and clubs are invited to join in the parade and requested to decorate their machines with the national colors and lanterns.

Participants in the parade have been invited by Manager Wellman to witness the motorcycle races at the new Brighton Beach Motordrome, and the parade will finish at the track. A special card of events is being arranged in which all the speed stars will appear, including the United Cyclists Sweepstakes and the Brooklyn Invincible Handicap.

Several boxes have been reserved and Mayor Gaynor, Borough President Steers and other city officials have been invited to review the parade and witness the races as the guests of President J. A. Hall, of the United Cyclists.

New York riders are requested to assemble at 7 o'clock sharp at Columbus Circle. The main parade will form as follows in Brooklyn, where it will be joined by the New York division:

Grand marshal, band, motorcycle police and motorcycle division on Heyward street, east of Bedford avenue.

Automobile division—Rutledge street, east of Bedford avenue.

Bicycle division—Penn street, east of Bedford avenue.

Route of parade—Bedford avenue to Parkside, to Ocean avenue, to Sheepshead Bay, to Brighton Motordrome.

The officials, so far selected, are Grand marshal, J. A. Hall; assistant grand marshal, A. H. Patterson; marshals, O. P. Warlick, V. J. Lind, Julius Bindrim, Sylvain Segal, Jerome Shaw and Jerome Mann.

Clubs or individuals desiring place in line or further information are requested to communicate at once with the United Cyclists' Parade Committee, 1080 Bedford avenue, Brooklyn, N. Y.

CHICAGO M. C. PICNIC.

CHICAGO.—Last Sunday was picnic day for the Chicago M. C., an outing being held for the members and friends at Sharpshooters' Park, a little over a mile from Hammond, Ind. Nearly six hundred riders were in attendance, including many tandemites. Competitions of every description were held, and the list of prizes was long.

All the events were scored on the point system, a first counting five, a second, three, and a third, one. Each contestant, therefore, was almost compelled to enter any event, and the one scoring the largest number of points was given first choice of the prizes. Wm. Murray won first choice with sixteen points, and picked a diamond ring donated by Marcus Gelder, a live member of the club. Rex Wickwire took a speedometer donated by the Edwards-Christ Company as second prize, and Wm. Covington picked a silk mohair riding suit for third; it was donated by The Hub.

AT Florence, Texas, June 28th and 29th, Gordon Purl riding his stock single cylinder Harley-Davidson (nearly two years old) won first place against all comers, including, among others, a port holed factory racing machine of another make.

His machine had been ridden 15,000 miles on a rural mail route previous to the race.

The day after the race the owner left on a pleasure trip through Mexico *on the same machine*, which trip would hardly have been undertaken if he had not been confident that his Harley-Davidson could still render satisfactory service.

Continued service is what you get in a Harley-Davidson and what you cannot obtain in any machine at a lower price.

Milwaukee, Wisconsin

SCENIC FEATURES OF COLUMBUS

IN addition to a squad of high-pressure enthusiasts the city of Columbus, toward which the eyes of motorcyclists throughout the country are now being turned, has many natural advantages as a convention scene, and not a few points of scenic beauty calculated to impress the visitor. The committee in charge of arrangements for the F. A. M. convention is keeping in mind all these natural conditions and making the most of them. As was shown in the detailed program of entertainment, which was printed in a recent issue, one of the big features of the entertainment is to be a barbecue at Olentangy Park, one of the real beauty spots of Columbus. This park, which is named from the Olentangy River, which runs through it, is one of the best natural parks in the State of Ohio. Situated on either bank of the Olentangy, it is sufficiently rolling and hilly to present most charming scenery. Nature has been lavish in framing this piece of woodland, but what nature has omitted the hand of man has accomplished, and landscape gardeners have made a portion of the park into a bower of flowers.

Olentangy Park.

Olentangy Park contains many pleasant retreats for motorcyclists, and in addition there are the usual forms of amusements found in parks of that nature. Manager J. W. Dusenbury has spared no pains to put the amusement plant in excellent shape for the F. A. M. barbecue and vaudeville entertainment. The park is reached over North High street, which is one of the best paved streets in the city. The street passes along the fine campus of the Ohio State University, which is another of the beauty spots of the Buckeye capital. The campus contains hundreds of acres laid out in excellent drives and boulevards, and there are no restrictions as to the use of the drives and boulevards by motorcyclists. On the campus are many fine buildings which are charming from an architectural standpoint.

Another park of great natural beauty, called Indianola, is located just outside of the city limits in the northeastern section. This park, like Olentangy, is situated on rolling ground. One of the features of entertainment at this park is the large swimming pool, located near the entrance. This pool is made of cement and is fed by natural springs which abound in that vicinity. The temperature of the water is controlled by the flow of different springs, and during the summer months thousands of people take advantage of the pool to have a cool plunge. Indianola Park is one of the charming spots of Columbus and will be a favorite place for motorcyclists to spend a few hours after a long, hot ride in the country.

But these two parks are not the only places

where a few hours can be spent in quiet and comfort. The city has a goodly number of public parks which are kept in excellent condition and which are open to the motorcyclists who will visit the Buckeye capital. Among these are: Goodale Park, Franklin Park, Schiller Park, Livingston Park and Heimandale Grove. Goodale Park is located nearest to the center of the city and is only half a mile from Broad and High streets. It is one of the best-kept parks, and is an ideal recreation spot, even in the torrid summer months. It is reached from Goodale street, which branches off High street within one block of the main entrance.

Fine Boulevards.

Schiller Park, formerly called City Park, is located in the southern end of the city and is two squares off High street, which is the principal thoroughfare of the Buckeye capital. Here is a statue of Schiller, the patron of that portion of the city which was settled exclusively by emigrants from Germany about a century ago. Schiller Park is one of the oldest of the city's parks and is well kept. It covers hundreds of acres. Excellent drives and boulevards penetrate the various parts.

One of the finest parks in the city is located in the extreme eastern part and is called Franklin Park. This was formerly the old Ohio State fair grounds and contains what is now styled a circle, formerly a race track. The park contains close to 1,000 acres, and is plentifully supplied with trees. Fine drives penetrate it in many directions, and the approaches are over excellent paved streets. The principal approach is over East Broad street, which is one of the thoroughfares often used by motorcyclists and automobilists. At Franklin Park most of the tours run by the Columbus Motorcycle Club are started, as it is an excellent place to congregate.

Livingston Park is located in the southeastern part of the city and is one of the newer breathing spots. It is a natural woodland and is beautifully laid out. It is located quite close to the Columbus Driving Park, which is credited with having the best dirt track in the United States. Heimandale Grove is a piece of woodland located outside of the city limits on the Groveport Pike, southeast of the city. This is a favorite picnic ground and is a point where motorcyclists can go for a day's pleasure.

United States Barracks.

Another point of interest is the United States Barracks, located on Cleveland avenue in the northeastern part of the city. The grounds are spacious and are provided with macadamized drives and boulevards. There are no restrictions against motorcyclists using the grounds for pleasure purposes.

Columbus contains many beautiful streets, which are one of the attractive features of the Buckeye capital. The city is shaped like a Maltese cross, being longer from east to west and north to south than in other directions. High street, which runs north and south, is the principal business street of the city. Beyond the few business blocks in the downtown district this street is paved with asphalt and is very frequently used by motorcyclists. The principal thoroughfare running east and west is Broad street, which is paved with asphalt east of High street for a distance of about five miles. Broad street is the principal residence thoroughfare of the city, and both sides are lined with beautiful mansions for a distance of several miles.

The city government has just completed the installation of a new lighting system, which will be in operation during the meeting of the F. A. M. It is an up-to-date cluster system and covers all of the central portion of the city. While the distinctive feature of the old system was that of the arches, the lighting under that plan was inadequate.

One of the places where activity will not be lacking during the F. A. M. meet is the home of the Columbus Motorcycle Club, which is located on East Eighth avenue. The clubhouse has been improved and the grounds have been placed in excellent shape for the coming of the horde of riders. The enthusiasm of the club members knows no bounds, and everything will be done to make the stay of the visitors break all sociability records.

ST. LOUIS CLUB BOOMING.

WITH a new set of officers in charge the St. Louis (Mo.) Motorcycle Club is keeping on the move these days, and interest in the organization is booming. From 35 to 40 members go out on the Sunday runs which are held regularly, and the meetings are also well attended. Not long ago the club cleared up all its outstanding bills and still had a tidy sum in the treasury. The club has made arrangements to have a strong delegation at the Columbus convention.

CHANGES OF ADDRESS.

SUBSCRIBERS to MOTORCYCLE ILLUSTRATED who contemplate changing their addresses are requested to send us notice to that effect at least two weeks in advance. Although the post offices notify this paper in such cases, its notices are usually received some time after the change of address has been made. As a result subscribers who depend entirely upon postal notices to this paper, often miss one or even two issues of the paper, or at least have such issues delayed in transmission.

REDUCE FRICTION

In the end, friction destroys all motors

Without friction your motor would never wear out.

Friction slowly but steadily wastes the power and wears the moving parts of motorcycle motors. This accounts for their short life.

To reduce this friction you should secure the nearest possible approach to perfect lubrication.

That involves the quality of your lubricating oil and its fitness for your motor.

Different types of motors demand different grades of oil.

Before correct lubrication can be determined, frictional conditions peculiar to different types of motors must be given consideration.

In producing Gargoyle Mobiloils we studied the construction of every American motorcycle.

We have drawn up a list of recommendations, showing the correct grade of Gargoyle Mobiloil for these various machines.

The complete list is shown on the right.

These oils and recommendations come from the Vacuum Oil Company, recognized by power-engineering circles throughout the world as the authoritative leaders in lubrication.

The oils specified will give the nearest approach to perfect lubrication that you can secure.

Gargoyle Mobiloils in quality establish a world standard. The various grades for motorcycles, refined and filtered to remove free carbon, are named:

Gargoyle Mobiloil "A"

Gargoyle Mobiloil "B"

Gargoyle Mobiloil "Arctic"

They are put up in barrels, half-barrels and in 5 and 1-gallon sealed, white cans.

All are branded with the Gargoyle, which is our mark of manufacture.

They are handled by the higher class garages, automobile supply stores and others who supply lubricants.

This list shows the right oil for your motorcycle.

Explanation: In this schedule the letter opposite the name of motorcycle indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." Recommendations cover all types of the same make unless otherwise stated.

MESINGER

MESINGER CAVALRY No. 4, with open front, for lowest saddle position. The ideal seat for man or woman.

STANDARD No. 4, showing open front for lowest position.

Comfort—Ease—Durability—that's what the Mesinger Saddle offers You

To you who contemplate extended trips this summer, we offer the Mesinger Cavalry Saddle as the maximum of comfort, ease and durability. There is no other saddle on the market to-day into which has entered such high-class material, such skilled workmanship, such scientific construction. All Mesinger Saddles are absolutely proof against any and all conditions which tend to destroy the efficiency of the ordinary saddle.

WHY? Because

- 1st—All frame parts are made of highly carbonized steel—no castings whatever are used in Mesinger Saddles.
- 2nd—All tops on Mesinger Saddles are made of the finest leather obtainable, and are stretched **before** shaping—not afterwards. All Mesinger Saddles are hand-padded with curled hair.
- 3rd—Our patent shock absorber not only positively absorbs all shocks, but also adds materially to the life of the springs.

Ask your dealer for a demonstration—or—

"ASK THE RIDER AND WATCH HIM RIDING."

Important—All tops and frame parts are guaranteed for one year.

POLICE CAPTAINS DON'T GUESS!

Capt. A. J. Stiles and ten members of the Chicago West Park Police motorcycle squad.

THEY KNOW THEIR SPEED AND YOURS

Police Departments make it their business to buy speed-indicators that are absolutely accurate, instruments capable of offering real evidence in Court. We reproduce an unsolicited letter from Capt. Stiles, of the Chicago Police. Read what he has to say about the JONES Speedometer. This is additional and undeniable evidence regarding our claim that the JONES is the most accurate speedometer obtainable.

WEST CHICAGO PARK COMMISSIONERS

Department of Police.

A. J. Stiles, Captain.

Chicago, June 21, 1912.

Jones Speedometer, Chicago, Ill.

Gentlemen: It is with great satisfaction that I have at last found a Speedometer that has proven under all kinds of tests to be almost absolutely perfect. I have tried all other Speedometers and was compelled to discard them as they would not stand a test for accuracy; or, in other words, were merely a guess. In using the Jones Speedometers in my Department, I can conscientiously say that we have found no condition, and under no circumstances the Jones Speedometer to be wrong.

Inasmuch as we are making a great many arrests for the violation of the State Vehicle Law, and with a disposition to be fair, I say again that it was a great consolation that we have found a Speedometer that we can depend upon. These Speedometers I test every day under a Stop-watch, and with a very few exceptions they are always accurate.

Yours very truly,

ARTHUR J. STILES, Captain.

West Park, Police Dept.

THE JONES

Model 31—3" 60 mile.

" 831—3" 80 "

Price \$20.00

The JONES is used by the police in all the larger cities of America and Europe. It is selected above ordinary speedometers because of its unerring accuracy—because it is the best instrument. Constructed on the principle of CENTRIFUGAL FORCE, impervious to temperature changes, and identical in construction with the famous JONES Speedometer used by motorists. Get a JONES for your machine. Quickly and easily attached. Ask your dealer. Do not accept an inaccurate substitute.

8,000 Miles on Empires

FRANK LIBBEY VALIANT
Manufacturer and Distributor of
SPECIALTIES

Angola, N. Y., Feb. 1, 1912.

EMPIRE TIRE CO.

Buffalo, N. Y.

Gentlemen:—I want to tell you the excellent service I have secured from Empire Checkered Tread Tires. When I started my test for the War Department last February I looked around for the tire best suited to stand the severe use to which it was to be put and chose the Empire. I never regretted it. I traveled a little over 8,000 miles without a puncture and nearly 14,000 miles before the tires were accidentally destroyed in a fire. They then appeared good for another season. "Service" and "Empire Tires" are synonymous. The wise rider chooses his mount—the ultra-wise insists on having it equipped with Empire Tires.

Yours very truly,

FRANK LIBBEY VALIANT.

DOESN'T THIS CONVINCING YOU?

Patterson's Tool-roll Carrier

Compact, Convenient,
Indestructible.
Straddles the lug-
gage carrier.
Especially adaptable
to Indians.

A tool-roll made of any cloth with departments sewn in for each tool, besides keeping each particular tool where it can always be easily found prevents tool-rubbing and the usual noisy rattle of loose tools.

When finished using the tools, simply roll up the tool-roll and insert in one of the tubes of the carrier. The second tube can be used for other purposes.

P.E.M. LEADS THEM ALL!

In every race meet in which the P.E.M. has been entered this year, its first season, this wonderful motorcycle has captured the big end of the first and second places. Just read this record—Deeds talk louder than claims.

JANESVILLE, WISC. — Big Decoration Day Meet. Six events; The P.E.M. took four firsts. In event 5, A P.E.M. "single" won by over 13 seconds a 10-mile race against a field of "twins."

MILWAUKEE, WISC., June 8th—The P.E.M. took first in novice, first in Private Owner and Second for Stock Machines (in this latter event the winner was a stripped machine with a trade rider).

OSHKOSH, WISC., June 9th—In Six events on a half mile track P.E.M. won five firsts and two seconds.

There is a reason for this regular consistent winning—and that is the superiority of the P.E.M.—Easy riding on bad tracks because of the "leaf-spring" hung frame.

High powered Engine because of high compression due to overhead valve mechanism. Positive chain drive with free engine clutch.

If you want to be a winner on the track or on the road—you must ride a P.E.M. Write today for booklet and special rider agency offer.

WAVERLEY MFG. CO., Waverley Place, JEFFERSON, WIS.

PIERCE SINGLE CYLINDER Wins Another Victory

Following letter received from F. A. Baker & Co., New York agents for Pierce motorcycles.

June 24, 1912.

The Pierce Cycle Co., Buffalo, N. Y.

Gentlemen:

"We wish to advise you that one of our riders yesterday went through the 200-mile Endurance Run of the North Jersey Motorcycle Club.

The rider says: 'I made them all sit up and take notice, for my Single would pass even the 7 h. p. twins.' He completed the entire distance without a single mechanical adjustment."

Ask for catalog and agency proposition. Immediate Deliveries.

The Pierce Cycle Company, Buffalo, N. Y.

Do Justice to Your Motorcycle

Equip it with the "Simplex" Spring Tandem Attachment

Safe, simple, durable.

Indestructible, because made of highly tempered steel.

Most efficient, because of its two shock absorbers.

Pleasing to the eye; finished in enamel and nickel.

Low saddle position; light and flexible.

Eliminates all discomfort; adjustable to weight of rider.

Xactly what you need; you won't feel lonely any more.

The extraordinary compactness of the "Simplex Spring Tandem Attachment," together with its two shock absorbers, weight adjustments, etc., make it the ideal attachment for comfortable and safe riding.

Price, including Saddle, \$15.

What Enthusiastic Riders Say About the Monarch BIG 5

44 Baltimore St., Hanover, Pa.

"I received the Monarch Big 5 on the 20th inst., in first-class condition. Have just tested it out on the biggest hill in this vicinity and it climbed a hill here, with the throttle only half open, that few of the singles have ever been able to make.

"In your letter of the 6th inst., you stated that you would give me the agency for this vicinity after I had taken the machine, tried it out, and saw for myself what it would do. Put me down quick for this vicinity.

"This machine more than exceeds my expectations. I will cover this territory thoroughly and if you receive any inquiries from this vicinity, send them to me. I can see now why you are willing to send the Monarch out and let a fellow see what it will do before he takes the agency. You know that your machine will do more than you claim for it. Your proposition is backed by facts."

(Signed) C. J. FREY.

Esbon, Kans.

"My machine came in last Saturday, the 18th, and about twenty-five people have been in to look at it. I took it out and the man here took his two speed motorcycle and we tried them on a hill and I could pull with the clutch hooked up solid as slow as he could on low. That's good, I think; it more than comes up to the mark."

(Signed) V. E. YAPP.

Fulton, N. Y.

"I have ridden my machine about two hundred miles and am very much pleased with it, and would not let it go unless I could get one just like it. Everyone that has inspected my machine thinks that it has unheard of improvements upon other machines that are selling in this vicinity."

(Signed) WESLEY J. GOODFELLOW.

Won Gold Medal with Monarch Big 5, Brooklyn to Southampton. 200 mile endurance run. Large field, all makes represented. Monarch proves "King of them all."

THE 'BAXTER SIDE-CAR

**The Strongest, Lightest
Most Comfortable Side-Car
in the World**

Ten years of side-car manufacturing experience has qualified us to state authoritatively that the Baxter side-car is fit to cope with any and all road conditions in America.

Its chassis of seamless steel tubing, double truss frame construction and rigid mudguard give it enormous stability.

Yet so scientifically is the weight distributed that it is the lightest frame on the market. Then, too, the hub spindles, the most vulnerable point on a side-car, are turned from solid Bessemer steel.

Comfort is assured by its tension spring absolutely absorbing all shocks, its deeply upholstered basket of India rattan and its popular English shape.

Note.—We make baskets to specifications. All parts quick-detachable and furnished separately if desired.

Always Ask FOR ANDERSON MOTOR Glass and Steel Spark Plugs

Model A

Licensed Price, \$1.50

and you will get a plug that you can always depend upon—a plug that makes good by sparking every time, all the time and always on time.

THE ANDERSON GLASS AND STEEL SPARK PLUG

is made of glass and steel, the glass being welded by a patented process to the steel shell and central electrodes which forms one integral whole, making this plug the strongest and most enduring one on the market.

The Anderson Glass and Steel Plug is absolutely gas tight under highest pressure—it is a perfect insulator and provides a maximum of insulating distance within the limits of the plug—it is a perfect non-absorbent and, lastly, being made of glass, it provides a “window to the engine” so that every spark can be seen from the outside.

The Anderson Spark Plug will increase very materially the speed of the machine using it.

The Bowden Patent Wire Mechanism

TREMENDOUS INDIAN BUSINESS

Four Thousand Orders Behind—10,000 Machines Season's Total Output—T. T. Models Big Favorites.

"Decidedly the chief reason for these repeated increases of output may be said to be the phenomenal and utterly unlooked for popularity which the Tourist Trophy models achieved as soon as they were announced. It was thought that this year, at least, the run of T. T.'s would be comparatively light, owing to the high price and the many innovations embodied in them. Instead, the demand exceeded the company's fondest expectations, the run on these models exceeding that of the rest of the line combined. Then, of course, there is to be considered the European business, which is entirely supplied by T. T. models.

"Price has been a totally negligible factor in Indian business this year, the buyers almost invariably ignoring this factor in booking their orders."

Bicycling World and Motorcycle Review, June 8, 1912.

(Signed) "J. C. STUART."

THAT TELLS THE STORY

The Persons Mfg. Co.
Worcester, Mass.

Before

After

J-D Visible Cured This Man

\$1.00

DIAGNOSIS—Ignition Trouble

PRESCRIPTION—One set J-D Visible Spark Plugs

FEE—\$1.00 per plug—money back if not absolutely satisfied

We can cure your ignition troubles, too. The new principle embodied in the J-D VISIBLE GAP SPARK PLUG enables you to locate and cure ignition trouble at a single glance. Through the port in the porcelain—outside the motor—you see if the spark is jumping the gap in the central electrode. If the spark jumps, but proper ignition fails to follow, then the plug must be foul or the carburetion faulty. If the spark does not jump, then trouble lies behind in magneto or wiring or coil or batteries. Knurled adjusting nut allows you to widen or close gap. Opened, it intensifies spark and cleans point automatically. Uses minimum current, makes timing of engine easy, and permits regulating of spark in any cylinder.

One look tells everything

If your dealer has not yet put the J-D VISIBLE PLUG in stock, we will mail you as many as you want, guaranteed, prepaid on receipt of price—just \$1.00 per plug. Write and tell us the size wanted or make of car.

A REVOLUTION IN MOTORCYCLE MOTOR DESIGN

In bringing out our DE LUXE line of motorcycle motors, we have introduced a large number of improvements, and offer these motors as the most advanced now before the trade.

NOTEWORTHY IMPROVEMENTS.

One-piece crank shaft.
One-part crank case with cover.
Improved cam and magneto drive.
Oil tight motor.
Large Valves.
Simplified design throughout.
Reduced number of parts.
Silent Motor.
Large ball bearings mounted in steel lined pockets.
Equipped with Bosch Magneto.

These improvements in design, together with the high grade materials used in construction, the modern methods of manufacturing applied, and the remarkable performance of these motors in road tests mark a revolution in motorcycle motor building.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS

THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

Model G-D—Price \$10.00.
Metal or Glass Bowl.

THE HEITGER CARBURETER

Model H, new type, has but *one* gasoline adjustment, but *two* feeds, one for high, one for low speeds, feeding from separate nozzles, giving maximum results at both speeds and intermediate with simplicity and reliability. No amount of vibration can affect it. Any speed easily adjusted and *stays* adjusted. Satisfaction guaranteed on *any* make of machine; adopted by manufacturers for 1912.

Model G-D is our double adjustment, or mechanical needle valve type, which has been used for two years by leading manufacturers and thousands of riders with best of satisfaction. As some prefer this we will continue to make it. Either type gives maximum results with minimum of fuel.

WE'RE FAIRLY SWAMPED WITH LETTERS LIKE THESE

Dallas, Texas, April 8th, 1912.

H. A. SIMPSON, Dallas, Texas.—This is to let you know that I am riding a big powerful 8 h. p. twin cylinder motorcycle equipped with one of your Model G-D double adjustment carbureters.

I have tried three other makes of well-known carbureters, and find by actual experience on the road that the Heitger gives more power and speed, greater flexibility and is more economical than any other I have ever used or tested.

With the Heitger I have made a record of thirty-five miles on one pint of gasoline, this being done against a strong wind on a rough, hilly road, with a big twin thrown into the bargain. I have also had the satisfaction of increasing the speed of my machine over twelve miles per hour, and while I do not claim that these things are world's records, let the fellows with the other carbureters beat it if they can, and under the same conditions.

**Heitger
Car-
bureter

When writing to advertisers, please mention **MOTORCYCLE ILLUSTRATED**.

For All Machines

There is no device on the market so peculiarly applicable to every make of machine, no matter whether it be a 1907 or a 1912, as the

Eclipse Free Engine Clutch

We have made thousands of Eclipse Clutches this year so far, and will make many more during the balance of the year, and will make twice as many next year. And the beauty of it all is—there isn't a single clutch we have made **THAT HAS NOT GIVEN ABSOLUTE SATISFACTION AND EFFICIENT, RELIABLE SERVICE AT ALL TIMES.** Let us make this plain to you—we *haven't had a complaint since we started!*

The ECLIPSE FREE ENGINE CLUTCH does three things and *does them well.*

First—It puts into the discard the old method of starting; climbing on and pedalling by main strength for half a block, before the motor picks up; or running alongside and taking a flying leap into the saddle. That's an awkward way—it prejudices a prospective buyer. With the ECLIPSE all you have to do is to climb on the machine, pedal a couple of revolutions, lift your stand and glide away easily as a touring car.

Second—it affords the widest range of speeds. When traffic riding, the ECLIPSE enables you to throttle down to five miles or even less an hour.

Third—On hills, in sand, mud or snow, the ECLIPSE enables you to negotiate

it is necessary either to coast back to the bottom or push the machine to the top. With the ECLIPSE, all that is necessary to do is to lower your stand, climb on, pedal once or twice, lift your stand and continue to the top of the hill. Simple, isn't it?

Simplicity of control—the ECLIPSE is supplied in either handlebar or side lever control. *Small number of parts*—the reason why we haven't received any complaints is because there is nothing about the ECLIPSE FREE ENGINE CLUTCH to get out of order.

The Eclipse Free Engine Clutch

The Clutch of many Speeds

For the rider who wants to lift his old machine out of the has-been class and make it a standard 1912 model—for the dealer who is desirous of handling an article which is absolutely guaranteed not only to give universal satisfaction, but practically sells itself—for the manufacturer who wishes to add a potent selling point to his machine, the ECLIPSE FREE ENGINE CLUTCH fills the bill.

Mr. Dealer—Now is the time to replenish your stock of ECLIPSE FREE ENGINE CLUTCHES. If by any chance you are not now handling the ECLIPSE, write for our proposition. You can't afford to wait.

ECLIPSE MACHINE CO.

ELMIRA, N. Y.

MOTORCYCLE TALKS

No. 9

(NOTE: This is the ninth instalment in the series of talks now appearing in the motorcycle papers dealing with those practical features that you should look for in the machine that you require for everyday service.)

Carburetion in the Schickel Motor

Five Years Ago

It was in the spring of 1907 that Mr. Norbert H. Schickel put his two-cycle engine into his first motorcycle. This machine could show a mile a minute on a level road, it negotiated easily a 50% grade and the motor was silent in its operation.

That was five years ago—a performance that is hard to duplicate today with any machine at any price.

It took five years of persistent and intelligent effort to bring the Schickel motor to its present high state of development. The 1912 motor in the main resembles the early 1907 model but certain changes have been made by way of introducing refinements in design.

THE INTAKE WITH A DOUBLE CURVE

The 1912 Schickel Valveless Two-Stroke motor takes the gas into the crank case through a double curved passage. This passage is completely surrounded by the exhaust gases. When a particle of fuel strikes the hot wall it gasifies and a thorough vaporization of the fresh charge is assured.

You can throttle this motor to four miles an hour. It will start on a quarter turn of pedal crank and thirty seconds later show maximum road speed. You can use this motor everyday for a whole season and still find the cylinder clean. The ingenious design of the intake passage makes it impossible for liquid fuel to enter the crank case. The charge is thoroughly gasified and burns clean.

The double curve intake is one of the many features that justifies our claim—The Master Motorcycle. Request us to send you literature describing all features.

The Truth Regarding The Gas Tank Patents

The U. S. Court for the Northern District of Illinois has, on final hearing, re-affirmed its previous decision in the gas tank patent case.

The case will now be appealed to the U. S. Circuit Court of Appeals, 7th Circuit, and a decision which will settle the controversy is expected in the fall.

Until a final decision is reached, the dealer is advised not to jump at conclusions. Meanwhile, these facts may be of interest:

Have the Gas Tank Patents Expired ?

Decided "Yes"

U. S. Court, Northern Dist., Illinois.

Decided "No"

U. S. Circuit Court of Appeals, 6th Circuit.
U. S. Court, Eastern Dist., Michigan.
U. S. Court, Indiana.
U. S. Court, Eastern Dist., Missouri.
U. S. Court, Southern Dist., California.
U. S. Court, Western Dist., Washington.
U. S. Court, Colorado.
U. S. Court, Western Dist., Texas.

Can Other Firms Re-fill Prest-O-Lite Tanks ?

Decided "Yes"

U. S. Court, Northern Dist., Illinois.

Decided "No"

U. S. Court, Eastern Dist., Wisconsin.
U. S. Court, Western Dist., New York.
U. S. Court, Indiana.
U. S. Court, Northern Dist., Texas.
U. S. Court, Eastern Dist., Michigan.
U. S. Court, Eastern Dist., Missouri.
U. S. Court, Southern Dist., California.
U. S. Court, Western Dist., Washington.
U. S. Court, Colorado.
U. S. Court, Western Dist., Texas.

One Case Already Decided by Higher Court

The decision in the U. S. Court for the Eastern District of Michigan, favoring The Prest-O-Lite Co., has already been affirmed on appeal by the U. S. Circuit Court of Appeals, 6th Circuit.

Appeal in the case just decided at Chicago is being taken to the U. S. Circuit Court of Appeals, 7th Circuit.

We wish merely to emphasize this:

Until this appeal has been decided by the higher courts, the questions involved in the gas tank patent suits are not SETTLED, even as against the defendant in this one case.

The Prest-O-Lite Co., Indianapolis, Ind.

Charging Stations and Branches in All Principal Cities.

Regardless of the Final Decision on Gas Tank Patents, No Dealer Can Afford to Overlook These Points:

- 1st—Every concern that has tried to win agents and customers away from Prest-O-Lite has failed to do so; and ALL except those involved in the present law suits have gone out of business.
- 2nd—In each and every case, where the gas tank maker quit the business, the dealers have “held the sack” on worthless tanks that could not be re-filled.
- 3rd—Every company, past or present, that has claimed “more gas and better gas than Prest-O-Lite” has failed to make good the claim.
- 4th—Every company, past or present, that has promised an adequate exchange service to compete with Prest-O-Lite, has fallen down.
- 5th—Prest-O-Lite is, and will continue to be (no matter how the patent cases finally go)

The ONLY gas tank backed by adequate exchange service.

The ONLY gas tank that motorists and the vast majority of dealers will have anything to do with.

The ONLY gas tank that a dealer can handle without risk of “holding the sack.”

The ONLY gas tank that will pay the dealer the profit he has a right to expect.

**Prest-O-Lite has always MADE money for dealers.
Imitations have always LOST money for dealers.**

The Prest-O-Lite Co., Indianapolis, Ind.

Exchange Agencies EVERYWHERE.

We Ask You to Take One Ride
on the

HENDERSON MOTOR CYCLE

7 h. p. 4 Cylinders; free engine, no pedals, chain drive—\$325

Ride on the Henderson once—and we are willing to leave the rest to your own judgment.

If you can do this and not come instantly to the conclusion that the Henderson is the greatest machine—in every respect—that you ever bestrode, we shall have nothing more to say.

You crank the Henderson by hand, mount and engage the clutch.

Instead of keeping your feet in uncomfortable positions on a pair of pedals and cooking your legs with the heat of the motor, you rest your feet on a foot-board well forward of the motor.

Instead of being shaken like jelly by the engine's vibration, you ride at ease.

Instead of having your ears filled with an exhaust crackle as sharp and nerve-racking as musketry fire, you hear only a low, business-like hum from the motor.

These are the things we want you to find out for yourself, in your own way and to your own satisfaction.

You can easily do it, as there doubtless is a Henderson dealer in your town.

If you don't know him, write us at once.

Sensation of the season. A new high-grade motorcycle lamp called the X-RAY at a price within reach of all. This lamp is being put on the market by the largest automobile lamp factory in the United States. We have had years of experience in making lamps for automobiles and motor trucks where excessive vibration must be overcome and we have constructed the X-RAY so there is no possible chance for the lamp to rattle or fall apart.

On account of our enormous automobile lamp business we are able to name a very low price so that we can secure a volume of business.

We want all jobbers and dealers to write for our proposition. Mention your buying capacity and let us send you samples prepaid express on approval.

READ THE SPECIFICATIONS

Front measurement $7\frac{3}{4}$ ", body measurement 6", genuine magnifying mirror lens 5". Props soldered and riveted to body. Hood or ventilator riveted to body. Body stamped of one piece heavy metal. Heavy

hinge and door catch thoroughly riveted. Lens (reflector) fastened with removable lugs, lens can be replaced in a few seconds, screw driver all that is necessary. Adjustable focus, can throw light in front of wheel or 200 feet ahead if necessary.

We are furnishing the X-RAY in two finishes, black and nickel and full nickel. All automobiles for 1913 are equipping with black and nickel finish on account of being so easily cleaned and never looking shabby. Our black enamel is baked at high heat and can be cleaned same as the motorcycle. It is guaranteed not to chip off.

TO RIDERS. The regular price of the X-RAY, black and nickel finish, is \$5.50, full nickel \$6.00, but to introduce X-RAY, knowing your friends will also want one, we are making the following special offer for 30 days. Black and nickel \$4.75, full nickel \$5.00, express charges prepaid. Send Postal order with order.

**WE POINT OUT TO YOU
THAT THE TRIUMPH
"NOJOLT" SEAT
IS A DISTINCT FEATURE
WITH A WIDE RANGE OF ACTION**

It has swivel action at three points and ball bearings. The rider sits on the shock absorber and not away from it. It suspends the rider practically on air. Does not impair the rigidity of the motorcycle frame; thus, wheels and transmission are always in alignment.

This device not only relieves the rider from all fatigue but eliminates shocks and strains from the entire motorcycle.

Triumph "NOJOLT" Seat is not a fad talking point, it is a necessity. One that now makes motorcycling a pleasure.

One would think that this is the only feature the Triumph possesses. Such is not the case. We just desire to impress upon your mind, that from now on, the rider will demand comfort and some other valuable features he has not enjoyed. There are other things more valuable to the average motorcyclist than excessive speed all of which the rider is now seeking.

Triumph Motorcycles

are built for comfort, for body and mind.

The "NOJOLT" features give the body comfort, while its sturdiness and strength relieves the mind from receiving jolts from repair bills. If you have received and read our booklet, "Brass Tacks", then send for the one called "A Celluloid Cat".

FEDERAL TIRES

THESE "Extra Service" tires constantly gain in popularity. Pronounced favoritism is shown for them among motorcyclists who understand the true meaning of *mileage*. In point of tire upkeep Federal Tires afford a decided saving. *They endure.* But they also have other distinctive advantages that appeal strongly to motorcycle riders.

Federal Tires are comfortable because of their wonderful elasticity and their exceptional ability in absorbing road irregularities. They are speedy, safe and easy riding.

The main reason for this big preference for Federal Tires is summed up in one word—*Quality*—simon-pure—unadulterated "all-wool-yard-wide" quality.

Federal Motorcycle Tires are supplied through leading dealers everywhere. Interesting tire book mailed on request

8 H. P. Twin, \$225

Speaking of tours and motorcycle endurance, here is an eye-opener.

Mr. F. W. Baum, of Champaign, Ill., surprised us Saturday (July 13) by arriving at the factory after covering a distance of 1,606 miles, by speedometer, in 7½ days' riding, an average of over 214 miles per day. Any experienced rider will admit that this does not allow time for much tinkering en route. You can figure it out yourself from the following itinerary:

Champaign, Ill., to Chicago, and return. Indianapolis. Thence by the National Pike to Columbus, Ohio; Wheeling, W. Va.; Uniontown, Pa.; Cumberland, Md.; Martinsburg, W. Va.; Washington, D. C.; Atlantic City; Baltimore, Md.; Philadelphia; New York; Boston, and Brockton, and the good old M-M was in perfect running order, and as good as new upon arrival at the factory, with the exception of broken pedals, and a very thick coating of mud, which testified to the extremely difficult riding encountered by this stalwart 187-pound student of the University of Illinois. Filled with enthusiasm, he started today, July 22, on a tour through Europe and the British Isles. You will hear more about the endurance of our machine on this trip in MOTORCYCLE ILLUSTRATED later on.

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and gives maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen $\frac{1}{4}$ -inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

POPE MOTORCYCLES

Model H, With Imported Magneto, \$165

A Pope Doing Double-Tandem Duty

The combined weight of the four men riding on the Pope Motorcycle shown in the above picture is 636 pounds. The motorcycle is owned by the Brown Music Company of Chicago, and the riders are employed by them in various capacities.

To carry four people, a motorcycle must not

only have strength enough to support their combined weights, but it must have plenty of reserve power to propel this enormous weight. That Pope Motorcycles are sufficiently strong and powerful to do this proves what we have often said concerning their wonderful durability and power in action.

A test such as this shows that for individual riding, the Pope may always be relied upon as a powerful thoroughly roadworthy machine, to go the route.

5,000 Miles on a Set of Empires

Ellis Rides 'Em on His Thor

JUNE 3, 1912.

EMPIRE TIRE CO.,
City.

Gentlemen:—

For the past two seasons my Thor 4 has been equipped with Empire Tires and Peerless red tubes. These tires have run in the neighborhood of 4,000 to 5,000 miles. Having been employed by the various repair shops in this city, I have had occasion to note the splendid service that Empire Tires have given to their users, especially where equipped with red Peerless tubes. In view of this, I feel that a few words in reference to this, would not be amiss.

Trusting that Empire Tires will have their continued good success as in the past, I beg to remain,

Yours respectfully,
JOHN ELLIS.

CHAINS too!"

Oh!

NECESSARY FOR THE MOTORCYCLE - AS THEY ARE NECESSARY FOR THE AUTOMOBILE

Necessity is the Mother of Successful Invention

THE insistent demand for a Motorcycle Anti-Skid Chain proved to us that it was a *necessity*. We have therefore produced **Weed Anti-Skid Chains for Motorcycles**—just as perfect in principle, construction and workmanship as **Weed Anti-Skid Chains for Automobiles**, which are so recognized as a tested, tried and time honored necessity that we are now *manufacturing and selling over forty miles of Weed Chains every day in the year.*

Weed Anti-Skid Motorcycle Chains

With the "Creeping Grip"

Give perfect traction, *prevent skidding and slipping.* Make motorcycling absolutely safe—sixty miles an hour—with perfect safety—make *all roads good roads.*

The continuous "creeping" prevents injury to the tires and keeps them clean, minimizing the chances of punctures.

The secret process of hardening the cross chains, just adopted, gives extreme lasting qualities.

Easily carried, as the small bundles they make in their canvas bags take so little room that they could be carried in your pocket, when not in use, without inconvenience.

Order them from your dealer or write us direct for full particulars.

A SEASONABLE SUGGESTION FOR MOTORCYCLISTS

Has your tire experience thus far this season been entirely satisfactory?

We hope it has been. Excessive tire trouble robs motorcycling of about one-half its pleasures. Besides, undependable tires are a constant drag on the pocketbook.

Therefore, we sincerely hope that no matter what brand of tires you have been using this season you have been getting service returns proportionate to your dollars and cents investment in tires. If you haven't been getting such results let us make a suggestion—

Try one or two Four-factory-tested United States Tires. Get the benefit of the extra strength, and the distinctive, all-around, service-yielding qualities built into these tires through our co-operative method of manufacture.

United States Tires are the product of four of the largest, most completely equipped and most expertly operated tire factories in the world.

They are not only four-factory-made but they are four-factory-tested, as well, giving the user a four-fold guarantee of quality and four-fold assurance that he will receive the long-lived road service he has a right to expect from his tires.

We believe that the extra strength we put into United States Tires through our exclusive methods of manufacture is all any motorcyclist needs to relieve him of unnecessary tire trouble.

Why not try them?

CONSTANT IS AMATEUR CHAMP

Brooklynite Sweeps Boards at Columbus, Piling Up Twenty-nine Points
Against Seventeen for Don Klark, His Closest Competitor—
Full Racing Returns.

HAVING rolled up a total of 29 points for the Bosch trophy, representative of the amateur championship at the F. A. M. national meet, John U. Constant, the Indian rider, of Brooklyn, N. Y., came into the limelight at Columbus and found himself the idol of race followers at the close of the four-meet convention program. Constant had a lead of 12 points over Don Klark, of Detroit, his nearest competitor. Klark managed to corral 17 points and thus took a substantial lead over E. R. Baker, of Indianapolis, who finished the program with nine points to his credit. "Shorty" Matthews had six points and Don Johns tied with him. Dan Willis and G. Evans figured in another tie, each having three points. Constant's 29 points were gathered out of a possible 37.

Each of the programs, which were staged on Thursday, Friday, Saturday and Sunday of the convention week, brought out a large crowd but not nearly as large as might have been attracted had the transportation facilities been up to the standard of the other arrangements. Visitors to the convention city experienced considerable trouble in reaching the motordrome by trolley and as a result motorcyclists who made the trip on their machines composed the bulk of the race following. There were finishes as tight as the wildest fan could hope for and plenty of sensational riding by the boys who were on the trail of the elusive championship points. Seymour showed well, as did Eddie Hasha, Klark, Graves, Willis and Evans and there was never a time when any speedster could count upon a runaway.

The official staff at the motordrome was made up as follows: Charles Fuller Gates, referee; A. H. Bartsch, of New York City, clerk of course; Robert Kirby, of Urbana, Ohio, assistant clerk of course; Paul J. C. Derkum, T. L. Morse, Howard French and H. G. Jacobs, starters for the four meets; Frank Flinn,

announcer; George W. Duncan, of St. Louis; Stanley Kellogg, of Bridgeport, Conn.; Charles H. Drude, of Detroit, Mich.; C. W. Hulse, of New Haven, Conn., and J. A. Turner, of Chicago, judges; J. A. Campbell, of Dayton, Ohio; T. J. Sullivan, of Chicago; W. M. Mathews, of Columbus; J. J. O'Connor, of New York City, and J. L. Donovan, of Chicago timers; G. J. Wagner, of Rochester, N. Y.; W. J. Surre, of Erie, Pa.; A. J. Lewis, of Alliance, Ohio, and J. Leo Sauer, of New York City, scorers; W. O. Law, of Troy, N. Y.; A. H. Harrop, of New Britain, Conn.; William Wood, of Baltimore, Md., and Thomas O. Wansleben, of Washington, D. C., umpires.

THURSDAY, July 18.—Ray Seymour struck his gait at the opening meet by carrying off first place in the 10-mile professional event with little difficulty. He was pressed by Eddie Hasha, the Texas speedster, for six miles but at that stage the Texan was retired by the bursting of his rear tire. Hasha managed to control his machine and avoid a spill, although he was clipping off about 80 miles per when the casing went bad. This event was one of the big features of the first day's racing.

About 4,000 people witnessed the races, most of them crowding into the infield in preference to occupying seats. Considerable interest was aroused in the 5-mile novice event, which was won by Charles Barker, of Attleboro, Mass., mounting an Indian, was in second place. John U. Constant, the amateur champ, featured in the 10-mile race for belt-driven machines, winning by more than a lap from Ray Snyder, of Columbus, his nearest competitor. Summaries:

Five miles, novice, stripped stock machines, 61.00 class—Won by Chas. Barker (Thor); second, B. M. Spencer (Indian); third, Chas. Dressell (Indian). Time, 4:42½.

Ten miles, F. A. M. amateur championship, 61.00 class; first heat, 3 miles—Won by E. W. Mathews (Thor); second, J. U. Constant (Indian); third, E. G. Baker (Indian). Time, 2:13¾.

Ten miles, F. A. M. amateur championship, 61.00 class; second heat, 3 miles—Won by Don Klark (Indian); second, Geo. Evans (Indian); third, Dan Willis (Indian). Time, 2:12¾.

Ten miles, professional, 61.00 class—Won by Ray Seymour (Indian); Eddie Hasha (Indian) out. Time, 6:49.

Five miles, F. A. M. amateur championship, 61.00 class; first heat, 3 miles—Won by E. W. Mathews (Thor); second, E. G. Baker (Indian); third, Dan Willis (Indian). Time, 2:13.

Five miles, F. A. M. amateur championship, 61.00 class; second heat, 3 miles—Won by J. U. Constant (Indian); second, Don Klark (Indian); third, Geo. Evans (Indian). Time, 2:06¾.

Ten miles, amateur, 61.00 class, restricted to belt-drive machines—Won by J. U. Constant (Indian); second, Ray Snyder (Emblem); third, Geo. Evans (Indian). Time, 8:57.

One mile, F. A. M. amateur championship, 61.00 class; first heat—Won by J. U. Constant (Indian); second, E. W. Mathews (Thor); third, Dan Willis (Indian). Time, 4:3¾.

One mile, F. A. M. amateur championship, 61.00 class; second heat—Won by Don Klark (Indian); second, Geo. Evans (Indian); third, Dan Willis (Indian). Time, 4:5¾.

FRIDAY, July 19.—Eddie Hasha put up a pretty exhibition in the 10-mile pro event which was a feature of the Friday night races, and managed to lead the field home, although he was hard pressed by Graves and Seymour. They were at his rear wheel when the tape was reached, and the finish brought the 3,000 spectators to their feet cheering.

It was found that the machines entered in the 15-mile pro event were not equipped with tanks sufficiently large to hold a supply of gasoline that would carry them over the route, and this race was postponed. The 5-mile race for the M. M. A. amateur trophy was also postponed, as the riders could not get their machines ready in time. The 10-mile race for trade riders, 30.50 class, brought out five entrants who put up a pretty exhibition. They got away in fine shape at the gun, with Lon Clafin leading. At the second mile the riders began to string out with Tay-

AT THE COLUMBUS MOTORDROME.

Top photo—Manager Snyder and W. G. Schack. Bottom—Russell Cole, of Worcester, Mass. Left column—Marty Graves, Don Klark, Ray Seymour and S. S. Taylor. Right column—Ed. Hasha, "Shorty" Matthews. One of the starts.

lor trailing. The squad passed Taylor on the eighth lap.

Willis was leading at this point, with Clafin and Constant at his rear wheel. On the eighteenth lap Clafin succeeded in passing Willis, and Constant followed his example. The starter failed to give the flag for the last lap, and the speedsters, not knowing that the race was over, continued riding with Clafin leading, Constant at his shoulder and Klark a few yards in the rear. After the race the riders entered a protest because they were not given the signal at the opening of the last lap. The race was awarded to Clafin, with Constant second and Klark third.

In the 5-mile professional championship race Eddie Hasha broke one of his grip controls in the first mile and was retired. Seymour won.

One of the unique features at the Motor-drome was the method of announcing the race results. A Goodyear balloon floated over the enclosure, and an official seated in its basket made the announcements through a megaphone. Summaries:

Five miles, private owners, stripped stock machines, 30.50 class—Won by Earl Converse, Columbus (Thor); second, Noble Sheppard, Kokomo, Ind. (Merkel). Time, 5:29.

Five miles, professional, F. A. M. championship, 61.00 class—Won by Ray Seymour (Indian); second, M. H. Graves (Indian). Time, 3:22½. Hasha started but dropped out.

Ten miles, professional championship, 61.00 class—Won by Eddie Hasha (Indian); second, Raymond Seymour (Indian); third, M. H. Graves (Indian). Time, 6:40½.

Ten miles, trade riders, 30.50 class, open—Won by Lon Clafin (Indian); second, John U. Constant (Indian); third, Don Klark (Indian). Time, 8:14½.

Five miles, professional, open—Won by M. H. Graves (Indian); second, Ray Seymour (Indian); third, Dave Kennie (Thor). Time, 3:25½.

SATURDAY, July 20.—Johnnie Constant, the Brooklyn record-crimper, showed his rear tire to a classy squad of speedsters at the Saturday meet. In the 10-mile event for the F. A. M. amateur championship Constant, Matthews, Klark, Baker and Evans faced the starter. Constant shot into the lead and cut out a terrific clip. He was unable to shake the others, however, and the first five miles were covered in 3:29, with the Brooklynite and Klark neck and neck. Baker was lapped by the leaders. In the seventh mile Klark gained a slight lead over Constant, which he held until the ninth mile, when John U. slowly crept back into his former position.

At the drop of the flag for the last lap Constant caught up with Klark, and started to pass him. Then came a battle royal. The fans cheered like fiends as the Brooklyn boy flashed across the tape in the lead, with Klark hugging his rear wheel. Matthews was a good third, and Baker was 100 yards in the rear. Referee Gates announced that Klark had fouled Matthews and he disqualified the Detroit and gave second place to the Thor rider. Constant led again in the one-mile F. A. M. championship event, winning from Klark and Willis handily. Summaries:

Five-mile novice, 61.00 class, stripped stock machines—Won by Joe Miller, of Columbus (Indian); second, Chas. Dressell, of Columbus (Indian). Time, 4:26.

Ten miles, F. A. M. amateur championship, 61.00 class, open—Won by J. U. Constant (Indian); second, E. W. Matthews (Thor); third, E. G. Baker (Indian). Time, 6:59½. Don Klark finished second but was disqualified.

Fifteen miles, professional, open, 61.00 class—Won by Eddie Hasha; second, M. H. Graves. Time, 10:53½.

Final 5 miles, F. A. M. amateur championship, 61.00 class, open—Won by Don Klark (Indian); second, J. U. Constant (Indian); third, G. E. Evans (Indian). Time, 3:28½.

Ten miles, trade riders, 30.50 class, open—Won by J. U. Constant (Indian); second, Don Klark (Indian); third, Dan Willis (Indian). Time, 8:51½.

One mile, for F. A. M. amateur championship, 61.00 class, open; final heat—Won by J. U. Constant (In-

dian); second, Don Klark (Indian); third, Dan Willis. Time, 4:40½.

Five miles, M. M. A. Trophy event, 61.00 class—Won by J. A. Yates, of Columbus (Indian); second, H. D. Woolley, of Columbus (Indian); third, Joe Miller. Time, 4:06½.

SUNDAY, July 21.—The biggest crowd that turned out during the four-day program witnessed Sunday's races on the bowl. All the boys were on their mettle and the fans were treated to a series of snappy finishes interspersed with some hair-raising escapes from spills and neck and neck brushes between the leaders for the honors of the last day. Constant romped off with first place in the 10-mile event for trade riders in the 61 class, and Seymour took the 3-mile open professional race. Seymour also bested Graves in the 5-mile open professional event, and Eddie Hasha was high man in the one-mile professional time trials. Summaries:

Five miles, private owners—Woolley (Indian), first; Dressell (Indian), second; Yates (Indian), third. Time, 4:13½.

Ten miles, trade riders, 61.00 class—Constant (Indian), first; Evans (Indian), second; Klark (Indian), out. Time, 7:13.

Three miles, professional, open—Seymour (Indian), first; Graves (Indian), second; Hasha (Indian), third. Time, 1:56.

Ten miles, trade riders, belt-drive, 61.00 class—Snyder (Emblem), first; Evans (Indian), disqualified for riding on running board; Willis (Indian), disqualified for riding on running board. Time, 9:42½.

Five miles, professional, open—Seymour (Indian), first; Graves (Indian), second. Time, 3:26½.

Professional time trials, one mile—Hasha (Indian), 37½; Seymour (Indian), 37½; Graves (Indian), 38½; Balke (Indian), 38½.

Amateur time trials, one mile, 30.50 class—Constant (Indian), 50½; Taylor (Emblem), 58.

AT THE HENDEE WIGWAM.

THE Indian representatives in Columbus pitched their wigwam at the Virginia Hotel, the official F. A. M. headquarters. Among those who were on hand to welcome the boys were Vice-President Oscar Hedstrom, F. J. Weschler, Edward Buffum, Charles Gustafson, Charlie Spencer, Billy Teubner and Fred L. Hunt. The Indian boosters kept "open house" and welcomed all riders regardless of their tribe.

THE YALE HEADQUARTERS.

YALE riders in the convention city found a squad of genial representatives of the Consolidated Mfg. Co., holding forth in room 422, on the fourth floor of the Virginia Hotel. Every Yale dealer and rider who registered at the company's headquarters received a souvenir and an old-fashioned handshake, not to speak of satisfying refreshments.

PLENTY OF ACTIVITY.

THERE was no end of activity at the headquarters of the Motorcycle Manufacturers' Association, in the parlor on the fourth floor of the Virginia Hotel, and M. M. A. officials were kept on the jump throughout the week. It was here that the joint tour committee of the F. A. M. and the M. M. A. held forth and hundreds of riders and dealers called to pay their respects.

H-D FOLKS AT HARTMAN.

HARLEY-DAVIDSON dealers and riders made their headquarters at the Hartman Hotel during the convention. With a view to affording their squad all the comfort possible the Harley-Davidson folks obtained a special room rate at the Hartman, and the boys took advantage of it and at the same time made most of their opportunity to fraternize with H-D riders from all parts of the country.

SEVERAL Baltimore, Md., motorcyclists are planning tours to Nova Scotia, Newfoundland.

MUNRO WINS ROAD RACE

Harrison Police Captain Sets Fast Clip Over a 10-Mile Course Featured by Dangerous Turns.

HARRISON, N. Y., July 20.—Mounted on a 7-h. Indian twin, Andrew Munro, captain of police of this town and widely known as a daring rider, won the ten-mile road race today, the first of its kind to take place in eastern Westchester County. It was under the auspices of the Aranac Athletic Association, in connection with an outdoor fair. Although a novelty hereabouts, the motorcycle race helped to bring out a thousand spectators. Munro's time for the ten miles was 15:07.

The course was a very difficult one, having four bad turns, one of them a right angular one. It led the motorcyclists through beautiful Macy Park, an exclusive residential section, the winding drives of which were opened to the race, through the courtesy of the owners of the property. An oiled and level straightaway of half a mile was at the finish. The riders went four times around the circuit of two and a half miles.

Munro took the lead almost from the start and despite an accident when he ran into a private hedge, maintained the lead throughout the race. Narrow escapes were frequent where the riders had to turn the right-angular turn, which was bounded on the outside by a rail fence separating the highway from a declivity leading to the railroad tracks of the New Haven R. R. Spectators grouped about this turn held their breath as the machines skidded dangerously near the fence in turning.

William Ford, of White Plains, on an Excelsior 7 was second; R. C. Queen, of Tarrytown, on a similar machine was third, while Joseph Kapp, of Port Chester, on the only single cylinder in the race, 4-h. "R.S.," was fourth. Queen sustained a bad fall when Ford ran into him while rounding a curve, but the machine only received slight damage and the rider was up and away in short order. The winner received a silver cup while the others got gold, silver and bronze medals respectively.

NEW ROAD HOG SPECIES.

COFFEYVILLE, Kan., can undoubtedly lay claim to having the meanest road hog in existence. A few nights ago Fred Scothorn, secretary of the Coffeyville Motorcycle Club, and his wife were riding their two-wheeler near the city limits, and a man was driving just ahead of them. Looking around he saw the motorcyclists and pulled his horse toward the edge of the road. Scothorn started to pass, and when he had advanced far enough to have his front wheel even with the back wheel of the buggy, the road hog let his horse take the middle of the road again, sending Scothorn into the ditch. Fortunately neither he nor his wife were hurt, but the machine was damaged. The engine refused to run after the spill, so the motorist could not find out who the miscreant was. This is the second time that an incident of this nature has occurred near Coffeyville. The club has vowed vengeance if the road hogs are found out.

COFFEYVILLE, Kan., with a population of 12,689, has 46 motorcyclists and 226 auto owners. Over two-thirds of the motorcycle riders are factory men whose weekly pay is less than twenty dollars. All the riders claim that the upkeep of the single-tracker is less than carfare would amount to in going and coming from their work.

PATTERSON IS F. A. M. PRESIDENT

IN accordance with general expectations, Dr. B. J. Patterson, of Pratt, Kan., was elected last Friday afternoon by the National F. A. M. Assembly in Columbus to succeed G. H. Hamilton as president of the Federation. Although it required two ballots to determine the contest, the Kansas candidate won by a comfortable vote over J. Leo Sauer, of New York, and Dr. Clint La Salle, of Rochester. The election was a spirited one, and fully enjoyed by all of the eighty-one delegates who participated.

At the morning session, among other constitutional amendments, the Assembly had adopted one providing that it require a majority vote to elect a national official. There being eighty-one delegates present, when nominations for the presidency were called for, President Hamilton announced that it would require forty-one votes to elect. The first ballot stood: Patterson, 36; Sauer, 28; La Salle, 17; on the second and final ballot Patterson received 42 votes, one more than a majority; Sauer 29, and La Salle 10.

Mr. Sauer was placed in nomination by Eph Ball, of Norfolk, Va., his nomination being seconded by Fred I. Willis, of Indianapolis. Dr. Patterson's nominator was P. N. Bushnell, of Aberdeen, So. Dak., and the nomination was seconded by Charles Fuller Gates, of Los Angeles. Dr. La Salle who, owing to the serious illness of his wife, was unable to be present, was placed in nomination by G. J. Wagner, treasurer of the Rochester club.

When the nominations were closed and before the first ballot was taken, Mr. Sauer arose to explain that he had never been a candidate for the office and from the start had made it very plain that he was not seeking the honor. He explained that it would be impossible for him to give the office the attention it deserved, and that those who voted for him would do so at the risk of having the presidency in the hands of one who could not devote sufficient time to the duties of the office. He stated, furthermore, that it was his belief that, inasmuch as the East had been well represented since the start, the West should now have a chief executive of the Federation.

Upon motion made by Sauer, the election of Dr. Patterson was declared unanimous. The Kansan was plainly pleased with his selection by the Assembly and, in response to urgent calls for an address, made an excellent

The New President

Dr. Patterson is the first F. A. M. chief executive to hail from a State west of the Mississippi. His election will undoubtedly give impetus to the Federation movement in the Far West, while the East may be depended upon to give its heartiest support to his administration.

impression. He thanked the delegates and, among other things, stated that he endorsed the policies of Dr. Thornley as chairman of the Competition Committee, and that he would reappoint the Doctor to his present office. As the reappointment of Thornley was regarded as even a bigger question than the presidency, Dr. Patterson's announcement that Thornley was his choice brought forth enthusiastic cheers.

E. M. Estabrook, of Bangor, Me., chairman of the Committee on Membership, was unanimously elected a director to succeed himself. When nominations for a director to succeed Winfield Graham were called for, Dr. Thornley named William N. Johnson, of Chicago, owner of the Riverview Motordrome. In explanation of his nomination, Dr. Thornley stated that inasmuch as board track racing had reached such proportions in the United States, it was only fair and wise that the board track owners should have a representative in the F. A. M. Board of Directors. Johnson was elected, though by only a few votes, over A. B. Coffman, president of the Motorcycle Manufacturers' Association. Paul Derkum, of Newark, N. J., and C. E. Barr, of Columbus, were the only other nominees.

Dr. G. B. Gibson, of Westboro, Mass., was unanimously elected secretary-treasurer, Mr. Fred I. Willis being instructed to cast the unanimous vote of the Assembly for the Westboro man. When called upon for a speech, Dr. Gibson expressed himself in two short sentences, as follows: "Gentlemen, as in the past, so in the future. I thank you."

At the beginning of the business session Friday morning, Mr. A. B. Coffman, president of the Motorcycle Manufacturers' Association, presented to the F. A. M., in behalf of the M. M. A., a beautiful silver trophy cup sixteen inches in height, to be competed for each year in a five-mile amateur, stock event at the national meet. The cup must be won three times in succession by one rider before it becomes his personal property. The cup was received with a vote of thanks.

Several reports of officers were read and adopted. The first was that of Chairman Estabrook, of the membership committee; the next that of Chairman Thornley, of the competition committee, followed by the report of J. Leo Sauer, chairman of the legal action committee, and F. I. Willis, chairman of the press committee. Synopses of these reports follow:

Vice-President La Salle, of the Atlantic District, sent in an exhaustive report, with many excellent recommendations. Dr. Patterson, vice-president of the Central District, rendered an oral report, as the detailed written report which he had prepared was left at home by accident. However, Dr. Patterson told of the great growth of interest in the sport in the West, and explained at length the details of the annual trip which the Short Grass Motorcycle Club is soon to take, he invited fifty more members of the F. A. M. to join. The report of A. W. Green, vice-president of the Southwestern District, was adopted, as was also that of E. L. Moore, vice-president of the Pacific District.

Several communications were read to the Assembly. Toledo, Ohio, and San Francisco, Cal., put in bids for the 1913 convention. A letter was read from the Auto Cycle Union of England, stating that the Union was in favor of forming an international motorcycle federation, and of forming an alliance with the F. A. M. as soon as possible. The letter met with much favor. The convention took a noon recess.

There was plenty of activity at the Saturday morning session of the delegates, and the matters demanding attention were discussed in a spirit which betokened a healthy interest in the affairs of the Federation. Several propositions were thoroughly threshed out, among them an amendment offered by J. A. Hall, of New York, which proposed that the F. A. M. transact its business at an annual session to be held alternately at the New York and Chicago shows. It was not the intention to abolish the annual summer meeting, but to devote it entirely to tours, racing and a general entertainment program. Mr. Hall argued that the business and social features should be separate, on the ground that delegates could not be expected to give proper attention to business details when entertainment inducements were being held out to them on all sides. The amendment was voted down, however, many of the delegates explaining that it would be impossible for them to take two vacations each year to attend the separate business and entertainment sessions.

Several of the speakers arguing along this line stated that with such an arrangement as the amendment proposed the business session in the winter would be handled entirely by trade interests, as trade representatives would be the only ones in a position to make the trip to New York or the Windy City. Objections were raised to this line of argument, but it was not denied that delegates in general would be seriously inconvenienced by the proposed rearrangement. Attention was also called to the fact that the delegates were displaying plenty of interest in the business sessions at Columbus despite the fact that there were many entertainment features to attract them. In this connection it is worthy of note that as many as 100 delegates were on the convention floor during most of the business sessions, a better showing than has ever been made in the past.

It was at the Friday afternoon session that the batch of amendments given above were adopted, and at the same time the following resolutions against tank-riding, speeding and other abuses of the single-tracker were passed upon:

Whereas, The Federation of American Motorcyclists believes in the use and not in the abuse of motorcycles; and

Whereas, One of the chief purposes of the Federation is to promote the best interests of motorcyclists and motorcycling; and

Whereas, The practice of "tank-riding," or carrying two passengers on a one-passenger motorcycle; the unreasonable and unnecessary use of the open muffler, and reckless and fast riding on streets, thoroughfares and roads in defiance of law and the rights of others are harmful and prejudicial to the best interests of all motorcyclists; therefore be it

Resolved, That the Federation of American Motorcyclists, in annual convention assembled, does hereby declare its opposition to the so-called "tank-riding," speeding and the open muffler, and does now call on each and all of its individual members and its affiliated clubs

to lend their active aid and influence in stamping out these evils; and be it further

Resolved, That the Federation of American Motorcyclists does now pledge itself to fight these abuses to the end, in order that the thoughtless acts of irresponsible riders shall no longer create public prejudice against law-abiding motorcyclists, and that motorcycling shall be known for what it truly is, a health-giving, comfortable and pleasurable recreation, a necessity in the quick dispatch of modern business and the king of sports.

THE NEW PRESIDENT.

"CONGRATULATIONS! All Kansas is proud of Pat, our new president."

The above telegram reached the F. A. M. convention at Columbus early Saturday morning. It was sent by P. E. Zimmerman, in behalf of Dr. Patterson's great following in Kansas.

Dr. Patterson brought a number of his followers and supporters to the Columbus convention; or, rather, the Patterson supporters just followed their candidate to Columbus to see that he was elected.

General approval of Dr. Patterson is expressed by those who know him intimately. He is described as a man who carries out his plans. The fact that he is plain-spoken and courageous was brought out at the convention.

The new president, in his final word to the Columbus convention said: "I want to see 30,000 members in the F. A. M. next year and I believe we can get them."

The election of Dr. Patterson may be traced back to the work of his wife, who was the originator of his "boom" and his campaign manager. "My work is done," said Mrs. Patterson. "I know that Dr. Patterson will make a good president and I am overjoyed to have the F. A. M. elect him, for I know they have not made a mistake. I am one of the proudest women in the United States today, and I am going to quit politics for good now, before I spoil my record."

Dr. Patterson has his "hobbies." He plays a cornet and is the leader of a band of forty pieces in his home city. Eph. Ball, the well-known Virginian delegate, "dared" Dr. Patterson to lead the band at the Columbus national race meet, and "Pat" answered: "Tell the band to play something decent—say, 'Poet and Peasant' or 'William Tell,' and I will lead them. But I don't care for the 'ragtime' stuff."

VICE-PRESIDENT LA SALLE'S REPORT.

This district held a meeting in Rochester, N. Y., August 19, 1911, at which Arthur Stroble, of Rochester, was elected district secretary, and R. S. Morton vice-chairman of the district. At that meeting the Atlantic District went on record against tank riding and in favor of State legislation prohibiting the practice, and also in favor of a State law making uniform regulation of the use of motorcycles in the State, thus eliminating the petty exactions of the smaller towns, as is now the case. This legislation was attempted by the writer, but for reasons later given no such law is yet on the books.

The annual meeting was held at Elmira, N. Y., July 4, at which Arthur Stroble was unanimously nominated for the vice-presidency of the Atlantic District for the coming year, the writer declining to serve another year. Many matters looking to the betterment of the F. A. M., increase in efficiency, giving the members more for their dollar, and means for keeping their membership and interest, after they are once in, were discussed. All of which points will be covered in the recommendations which follow.

The writer feels that he has been singularly fortunate in the officers that he selected to aid him in the past year's work. Vice-Chairman Morton, who has also acted as New York State Commissioner, has been at all times and places cheerfully ready to put his shoulder to the wheel, both in State and district affairs, and has been a most helpful and efficient officer.

E. B. Connell, Pennsylvania Commissioner, who was State Secretary last year, has used his previous experience to splendid advantage. He has worked hard and unceasingly, and after a short observance

of the way Mr. Connell took hold, we felt that Pennsylvania could take care of itself, a view which has been justified by the well-nigh perfect State organization Connell has built up.

W. T. Reed, appointed New Jersey Commissioner, vice Anderson, is a comparative newcomer in the motorcycle game, and feeling his inexperience at this line of work he has gone carefully at his task. He has applied the practical methods acquired through a long and successful business career, and his work up to date has been effective and complete.

That Maryland has been in good hands is shown by the activity apparent in Baltimore, wherein is the major portion of the motorcyclists of the State. Woods' previous work as Maryland Commissioner fitted him admirably for the continuance of the office under our administration.

In organizing and getting into motion the new Atlantic District, we were at once put to it to secure State Commissioners. None were appointed without their ability to handle the office in a businesslike, thorough way being established. We have not been able to secure commissioners for West Virginia and Delaware at all. Virginia lingered for a time, but the delay has been justified by the splendid work of E. B. Ewell.

Just a word of comment on the work of our Secretary-Treasurer. One who has not had the enlightening experience of being secretary to smaller organizations than our National body, as has the writer on several occasions, can not appreciate what it means to keep the work of the Secretary-Treasurer's office of the F. A. M. up to the minute. True, the present incumbent receives an amount sufficient to make it no falsehood when we say, "He's paid"; still the recompense he receives compares poorly with the amount similar labor and responsibility would command in the world of business. Dr. Gibson is deserving of recognition of his enthusiastic service by as much of an advance in emolument as we can afford to render.

A national officer, who is in position to speak with authority, has said that the Atlantic District is the best organized in the country. This might be considered provocation for us to get chesty—but it isn't. What the gentleman meant was that the district committees were filled and that the State commissioners were doing their work in getting local commissioners. It is a fact that most of the Atlantic District States show a fairly good list of officers, but the real test of the effectiveness of our, or any other district's work, in fact the work of the entire F. A. M., lies farther afield.

During the past year the ubiquitous "What do I get for my dollar?" has stuck its unlovely phiz into our sanctum so often that we made up our mind there must be a reason for the persistent life of the query. Conscientious study has convinced us that there is reason for it.

The proper question should be: Are we giving our members all they are entitled to? Are we seeing to it that the motorcyclists of the country enjoy all the safeguards that surround the users of other utilities of transportation, which are theirs by right? Are we as well prepared to resist encroachment upon our constitutional rights as the users of the auto, for example? If one of our members wishes to tour from Baltimore to "Frisco" via New York and Buffalo, can we give him a map and road dope covering the main trunk route through the Atlantic District, and sell him at cost the same books covering the other districts he will pass through? And do the books mentioned contain registered F. A. M. hotels wherein he may get good service, courteous treatment and reasonable rates? Along with the list of registered repair shops, F. A. M. clubs, does the book list an F. A. M. attorney in each large town who may be depended upon to take care of the rider's interests in case of local prosecution—or persecution, as is sometimes the case? And in case of a successful defense is the rider sure of being charged a moderate fee?

These things are all in the scope of the avowed purposes of the F. A. M., and if the organization does not give all of them to its members it does not live up to its avowed intent and purpose, and there is reason for the question anent the dollar.

It is not, however, "How much can we give for a dollar?" The public will buy when it knows it gets value for value and it is plainly up to us to determine what we shall list in our stock so that the proposition will not be "Why don't you join?" but, "How can you afford to stay out?" Further, let us stock up with the right goods, find what it is worth to give real value, and then charge accordingly. No business of consequence today can run successfully for long unless it be run on the basis of cost. Do we know what it costs us to make a member? Can we tell within a few cents what renewals cost us?

Taking our questions seriatim, let us see where we stand. Before going further, we wish to state that all this matter was thoroughly considered at the beginning of our administration, and portions of the plan outlined would have been attempted, except that it was more than a one-man job.

As to legal safeguards: In New York conditions are such that different townships may pass restrictive legislation that hampers our riders going from town to town. In order to correct this condition, we requested R. Douglass Boyd, Fulton County Commissioner, and member of the New York State Committee, to draft a bill covering this and other points, which he did, making a very good bill. This we forwarded to the National Law Committee Chairman with the request that he make such corrections as he deemed advisable and see to its early introduction into the State Legislature. He examined the bill and

(Continued on page 55.)

TO the end of placing the F. A. M. in a position where its officials may direct their efforts along thoroughly co-operative and genuinely constructive lines, and with a view to affording the Federation rider tangible returns for his membership, a number of broad amendments to the Constitution and By-Laws were submitted at the Columbus Assembly and adopted without opposition. Of chief importance is the amendment providing for the abolition of the existing system of districts and district vice-presidencies, the aim being to offset the present unwieldiness of the governmental units through the perfecting of compact and well-directed State organizations. That the solution of the problem which has given leading spirits in the F. A. M. food for serious thought of late lies in this direction was the practically unanimous opinion at Columbus, and the amendment paving the way for the revision was promptly approved. This provision carries with it a clause permitting the President, with the consent of the Board of Directors, to remove any State Commissioner who proves his unfitness for the office by laxity in the performance of his duties.

Of almost equal importance, and certainly of more direct interest to the average rider, is another amendment calling for the organization of a National Touring Bureau of the F. A. M. This bureau will be substituted for two national committees, on Tours and Hotels and Transportation and Facilities, these committees being abolished under the amendment. It is the intention to have the bureau directed by a salaried man to be appointed by the President with the approval of the Board of Directors. The tour official will be called upon to obtain and file all available data with reference to routes and road conditions throughout the country in order that he may be in a position to answer any reasonable query from an F. A. M. member who is preparing to make a tour. As the bureau develops an effort will be made to supply maps for all tourable districts and to give motorcyclists many of the advantages now afforded automobilists through their national organizations. That this is one of the most important steps so far taken by the Federation, from the viewpoint of riders in general, goes without saying, and the officials look forward to making the National Touring Bureau a potent factor in the upbuilding of the F. A. M. of the future.

A radical change is provided for in the committee system by another amendment, which states that the committees on Membership, Legal Action, Competition, Publicity and Highway Improvement shall consist of a chairman and the members of the Federation Board of Directors. With this arrangement the Directors cannot fail to be closely in touch with the work of each committee, responsibility will be centralized and the several chairmen will of necessity put forth their best efforts for the advancement of their departments. The resolutions embodying the amendments were adopted in full as follows:

Whereas, under its present system of government, the Federation of American Motorcyclists is not in position to make the most of its opportunities; and

Whereas, We have been handicapped by the absence of continuity and by a lack of co-ordination of the different units of our government, because parts of our Constitution and By-Laws are not properly adopted to satisfy the requirement of an organization of this character in a country of this size; and

Whereas, It is the sentiment of this Assembly that the future should witness the accomplishment of more genuinely constructive work for the direct benefit of our entire membership; therefore be it

Resolved, That this Assembly so amend the Constitution and By-Laws of the Federation of American Motorcyclists as to incorporate the following changes and additions:

First, the abolition of the District System and the District Vice-Presidencies.

Second, an exact definition of the duties of the State Commissioners, including the appointment of local commissioners, and the rendition of monthly reports to the National Secretary concerning all matters affecting motorcyclists in their respective territories, together with the proviso that it shall be the privilege and the duty of the President to remove from office, with the consent of the Board of Directors, any State Commissioner who has shown lack of ability or inclination to do his work.

Third, so changing the committee system as to have the Committees on Membership, Legal

Action, Competition, Publicity and Highway Improvement consist of a Chairman and the Board of Directors.

Fourth, the abolition of the two National Committees on Tours and Hotels and Transportation and Facilities.

Fifth, the organization, in place of these two committees, of a National Touring Bureau, to be in charge of a salaried man, to be appointed and to be removable by the President with the approval of the Board of Directors.

Sixth, a provision that in the event of a vacancy occurring in any elective office, it shall be filled by a two-thirds vote of the entire Board of Directors.

Seventh, that it shall require a majority vote, at any Assembly, of the delegates present to elect any national official except Directors, in the selection of whom a plurality vote shall be sufficient.

Eighth, that upon petition of three or more directors any act of any F. A. M. national official shall be called up for approval or nullification by a majority vote of the Board of Directors; and

Be it further resolved, That these amendments go into effect immediately; that a committee of two be appointed by the President to write said amendments into our Constitution and By-Laws; that said committee is hereby authorized and instructed to have a copy of the so revised Constitution in the hands of the National Secretary within ten days after the adjournment of this Assembly, and that the exact language of the changes and additions be given out for publication in the trade press as soon thereafter as possible.

ESTABROOK'S REPORT.

I HEREWITH submit my annual report: The work of this office is so closely associated with that of the National Secretary and the results of its efforts, in a membership way, are so intermingled with the work of our secretary and other good workers, that it would seem meet that the secretaries' report should cover the joint efforts of all workers in common.

Manufacturers of motorcycles and accessories, jobbers of motorcycle and bicycle sundries, motorcycle and bicycle dealers, together with repairers, have co-operated with this office in an efficient and friendly manner, in the dissemination of the gospel of the F. A. M.; and it is safe to assert that

the Federation has been well advertised.

The work of club organization throughout the country has been steadily advanced and also carried to a successful termination in the Canal Zone and the Philippine Islands, while prospective work has been done in other remote quarters. Several hundred dollars' worth of Old Sol lamps have been distributed among our clubs as prizes for building up their membership, and more are in prospect.

Considerable work has been done in the interests of membership by establishing recruiting stations throughout the country, and it may be interesting to note that we have a station in Culebra, Panama, and one in Edinburgh, Scotland.

Considerable laborious work in the interest of better State and local organization has been directed from this office with but indifferent results, due to adverse conditions existing locally.

SECRETARY'S REPORT.

HEALTHY gains in all departments of the F. A. M. are set forth in the report of Secretary Gibson with reference to the growth of the organization for the fiscal year just closed. The national secretary submitted the following statement:

It is very gratifying to be able to show such a healthy growth in our organization during the past year, and to feel that we have now reached a strength that is causing us to be recognized as a power in the motor world. I confidently expect that within five years, we will have reached the membership and recognition formerly enjoyed by the grand old (L. A. W.) League of American Wheelmen, which organization's logical successor we are. I might incidentally state that we hold membership card No. 775 in the L. A. W., joining in old high wheel ordinary days, and still keep up our membership like many of the old members, for sentiment, if nothing else.

I wish to state that the vital records of the F. A. M. are kept in a good safe, which is now full almost to capacity; the vital membership records are kept in duplicate, one set in concise form in our safe; we are protected by a \$1,500.00 fire insurance policy; we keep tabulated, in arranged forms, data regarding the various departments of our work, and are able in a few moments to obtain any data we may be called upon to furnish.

We have outgrown our present quarters and must seek another location for our increasing work; with four stenographers, an office boy, five typewriters, two roll-top desks, four typewriter desks, a safe, two writing tables, six large three-section filing cabinets, a stock room, and a cabinet for odds and ends, papers and reports, you will at once obtain some idea of our office equipment and needs.

The total enrollment of the Federation on July 9, 1911, was 9,664, and on July 1, 1912, it had jumped to 16,250, a gain of 6,586. The fully paid up membership on July 9, 1911, was 7,296, and on July 1 of the current year it was 11,929, divided as follows: Affiliated riders, 9,077; unaffiliated, 2,852. The records show that on July 9 of last year 168 clubs had been affiliated, and on July 1 of the current year the F. A. M. clubs numbered 291, a gain of 123. The registered repair shop list also shows a marked gain, no less than 356 establishments having been brought under the Federation banner in the last fiscal year. On July 1 last the Secretary's records showed that 678 shops were on the registered list.

LEGAL ACTION.

Chairman J. Leo Sauer, of the National Committee on Legal Action, briefly reviewed the work of his committee and expressed his intention to introduce resolutions looking to several important changes and extensions, his report being substantially as follows:

As a result of action taken by this committee, a bill prohibiting motorcycle racing in the State of New York was defeated, as was also a measure in New York City, the object of which was to impose unfair regulations upon the owners of motorcycle garages.

Action is pending in a number of cases, the most important among these being as follows:

Against an ordinance in Lockport, N. Y., which would prohibit tandem riding in that city; in connection with the arrest of endurance riders in Bakersfield, Cal.; relative to the passage in Alabama of a law imposing an annual license fee of \$100 on motorcycle dealers; to the end of reducing some of the motorcycle toll rates in the State of Pennsylvania; also ferry charges between San Francisco and Oakland.

For a number of reasons the work of this committee has not been at all satisfactory to its chairman. He is perfectly willing to assume his share of the responsibility, though much of the difficulty lies at the very roots of the organization. However, the object of this report is simply to state what has been done, and not give reasons or excuses for your chairman's failures to do certain other things.

Aside from my duties as chairman of this committee, I have been delegated by your President to undertake several missions of more or less importance, concerning which the following report may be of interest:

(1) Last fall I went to Toronto, Canada, in order to ascertain the sentiment of Canadian riders toward the F. A. M. Although I found the Toronto and other Canadian clubs to be very friendly to our organization, I soon learned that there was very little prospect of their joining the Federation as a Canadian District. As a matter of fact, as I predicted at the 1911 Assembly, the Canadian District has never existed except on paper. Accordingly, I endeavored to make it very plain to our Canadian friends that our organization was not seeking to control the situation there, but simply to insure, among other things, reciprocal competitive relations. Since my visit to Toronto a separate Canadian organization has been formed, and I therefore recommend the abolition of the so-called Canadian District of the F. A. M., and also the adoption of a resolution inviting the Canadian Association to enter into a close alliance with our Federation.

(2) Your President instructed me to investigate the matter of providing up-to-date touring maps for F. A. M. members. I have given this question exhaustive study, and have come to the conclusion that, instead of using the maps of some automobile association, we should at once establish a touring bureau of our own, this bureau to replace our present inactive national committees on highway improvement, tours and hotels, and transportation and facilities.

(3) The writer is a member of a committee instructed by your President to report with reference to the adoption of an F. A. M. uniform. This matter was taken up with Mr. A. B. Coffman, who will report his findings to the Assembly.

(4) The writer was authorized to prepare a draft of a contract for exclusive board track franchises and also to arrange for the auditing of the books of the chairman of the Competition Committee. Both of these matters have been attended to.

Referring directly to the work and also the failures of the Legal Action Committee, the fact should be emphasized that this committee has never enjoyed proper co-operation, without which very little is possible. For example, in four out of five cases of adverse legislation, this committee has been advised after instead of before the enactment of objectionable laws. In some cases the information has come from a State Commissioner, but not always. Now it is a fact that it is easier to defeat legislation before its passage than after.

That is why we have been successful in New York State, where we learned of the prospect of the adoption of legislation while it was still in the hands of a committee. The undersigned has received at least one criticism, anent our activity in New York State at the apparent expense of other parts of the country. Such criticism would be justified were it not for the fact that the chairman of this committee had to depend upon others for information from other States, which information was forthcoming very rarely.

The chairman has found it necessary to decline to take up personal damage suits owing to lack of facilities and lack of funds. It is to be trusted, however, that in time special arrangements may be made with a view to this committee's assisting in particularly distressing cases.

In this connection, aid could be rendered by this committee in at least a few personal damage suits

each year, if it was certain that the income from exclusive board track franchise fees is to be permanent. Under the resolutions adopted by the Board of Directors early this year, the first \$1,000 was to be set aside each year for the uses of the National Committee on Legal Action. As a matter of fact, \$1,000 was set aside this year, but as there is no way of knowing how much, if anything, will be available in future years, the committee cannot very well plan far ahead.

Legal action is always expensive, as compared with the average grades of other work. Experience has demonstrated that a poor lawyer is worse than none at all, while a good one comes high. As the chairman of this committee does not profess to be a lawyer, he has found it necessary in cases of doubt to consult men who make the law their profession. One thousand or \$1,500 will not go very far in buying legal advice, and the writer believes that in due time, though not this year, it will be wise to pay a good lawyer to take charge of the National Committee on Legal Action and, perhaps, charge larger membership fees for special benefits in the way of legal protection, insurance, etc. I am of the opinion, however, that at the present time we should concentrate our efforts to the end of building up a first-class touring bureau, which I believe to be entirely practical and detailed plans for which I intend to place before this Assembly this week.

My one year's chairmanship of the National Committee on Legal Action has convinced me that our present system of organization is much at fault for the failure of most of the national committees to do constructive work. I recommend radical changes, notably the placing of more responsibility upon the shoulders of State Commissioners.

FINE PUBLICITY

Obtained Along the Routes by F. A. M. Tour-Masters.

INTERVIEWS like the one below appeared in many a newspaper last week, thanks to the foresight of Guernsey Van Riper, who is in charge of the F. A. M. Publicity Bureau and who supplied the various tour-masters with some clever made-to-order "dope":

"We're on our way to Columbus, O., to attend the 1912 convention and meet of the Federation of American Motorcyclists, and if we have one-half as good a time at Columbus as we are having on the road it will be a record-breaking meet," said J. A. Campbell, of Dayton, the tour-master.

"Columbus will entertain the F. A. M. for five days, beginning Wednesday, July 17, and Columbus has promised visiting motorcyclists a royal welcome and continuous entertainment. But let me say this: The four national tours to Columbus are giving the riders a world of pleasure, and Columbus will have to hurry to show the boys more fun than they are having on the way.

"We are just loafing along, enjoying the scenery and the fresh air. We start each morning when we get ready and we stop at any point along the route that proves of interest. That's better than riding on a train, isn't it?

"The motorcyclist knows what freedom means. He can go anywhere—at any time. His machine is always ready. It costs but a trifle to operate it. It is simple—and above all it is comfortable. It doesn't take a skilled engineer to run it. Anyone who can ride a bicycle can ride a motorcycle.

"The increased interest in motorcycling is shown by the wonderful increase in membership of the Federation of American Motorcyclists. It now has more than 16,000 members. It is gaining approximately 750 members each month. The Federation encourages motorcyclists to use and not to abuse the motorcycle. Its influence is bringing the public to realize that a motorcycle—already conceded to be convenient, comfortable and inexpensive—is also clean, silent and almost a modern necessity in business or pleasure. And we believe the four tours to the F. A. M. meet at Columbus will do much to demonstrate these facts to the public."

E. M. ESTABROOK,
Chairman F. A. M. Membership Committee.

ONE of the most significant points to be noted in connection with the four national tours to Columbus is that the riders were recruited from an area embracing a dozen States, thus indicating that touring interest among motorcyclists is no longer confined to half a score of the larger cities. The small-town tourist was much in evidence. In some cases a single rider traveled fifty, or sixty miles in order to join one of the tour branches, but in every instance he managed to join. That was the feature of real import. He might be a solitary enthusiast in a town where solitude was the principal asset, and where he had an absolute corner on the motorcycle interest, but when the tour call reached him he trussed up his mount and went forth to join the boys. The heavy percentage of riders in this class, among the 400 tourists who rode into the convention city, is a highly encouraging feature for consideration with the convention aftermath. Touring with a party of congenial spirits is a comparatively simple matter, but playing a lone hand over bad roads in a sparsely settled district is the supreme test of interest and enduring spirit. Plenty of just such spirit rolled into Columbus on Wednesday of the convention week.

That the tours were successful was admitted by even the most captious. Mishaps that caused serious annoyance were comparatively few, despite the fact that certain stages of the runs took on all the earmarks of endurance contests, and when the four squads met in the convention city there was not a rider in evidence who regretted his part in the four-cornered pageant. Each tour started with a handful of riders, but as the divisions made their way to Columbus little parties joined here and there, and at some of the most out-of-the-way points a rider or two popped suddenly out of a by-road and chugged merrily along with the boys. As a result each division had assumed creditable proportions when the night stops were made before the final jaunt into the Buckeye capital.

While every effort was made to avoid imposing hardships on the riders, the traveling schedules were adhered to fairly well. The entrance of the tourists into Columbus could hardly have been more impressive. The visitors were joined on the outskirts of the city by about 200 Columbus riders so that the squad that finally rolled into the convention city numbered about 600 enthusiasts. A halt

was made just outside the city, and the riders gave their machines and clothing a hurried overhauling. During this stop President Hamilton and other R. A. M. officials reviewed the big squad, and congratulated the tourmasters and their assistants.

Then came the run into the city. President Hamilton took a seat in a side-car driven by W. J. Teubner, who was also carrying P. B. Whitney, of Chicago, on his tandem attachment, and the word was given for the start. The riders were strung out two abreast for more than a mile as they passed into High street on their way to the State House. Traffic was brought to a standstill as the riders entered the city, and thousands of Columbusites lined the streets. When the machines were finally parked for a photograph they made a double line two blocks long.

IN PRISON GARB.

Representing Joliet, the Penitentiary Town:
F. E. Beck, Glenn Peterson and H. F. Stoll, All Harley-Davidson Riders.

Later each rider who finished the tour on time received an attractive medal suitable for use as a watch fob.

The northeastern tour, of which Fred S. Ellett, of Elmira, N. Y., was tourmaster, was the longest, and the start was made on Saturday morning, July 14. The distance traversed was a little over 700 miles. The southeastern tour started at Baltimore, with J. A. Robison, of Baltimore, Md., as tourmaster. This trip of nearly 500 miles was probably the hardest of the four, although the boys from Albany say, with much pride, that they experienced the hardest trip. The northwestern tour of about 400 miles was started on Monday, July 15, on the same day that the southwestern tour got into action. Jesse Campbell, of Dayton, Ohio, and Erwin G. Baker, of Indianapolis, were the tourmasters of these two divisions.

No one will dispute the fact that the southwestern trip was the most pleasant, and nearest to the ideal which the originators of the tours had in mind. Weather conditions were excellent all the way, and the roads, except for a short distance the first day, were unusually fine.

It was not so with the three other tours, for each of them experienced more or less (usually more) rain, and consequently great stretches of almost unrideable roads. These tourists were unfortunate enough to strike many roads which were just being constructed, and as it was either raining at the time, or just stopping, the roads at some places were so bad that detours from the scheduled route were necessary.

Most of the road trouble was in the East near Cleveland, and every one of the tourists who finally pulled through and who had not been heretofore an ardent worker in the cause of good roads, had been converted. The Baltimore tourists, as was to be expected, experienced their most serious trouble in the eastern ridge of mountains, where, to make matters worse, they were caught in the rain. Not all of the Eastern tourists arrived at Columbus on schedule time, and many were as much as a day late.

MAPPING LONG TOUR.

ONE of the summer tours for the Minnesota State Automobile Association is being outlined and mapped by J. W. Whitehead of Minneapolis on a motorcycle.

NEARLY 400 TOURISTS.

AL BARTSCH, of the Bosch Magneto Company, carefully kept and compiled a record of the machines which entered Columbus Wednesday on the four F. A. M. tours. Excluding those who came into town later than six o'clock Wednesday evening, there were 385 participants, their machines being as follows:

Emblem, 11; Thor, 33; Minneapolis, 3; R. S., 3; Pierce, 3; Flanders, 4; Henderson, 7; Pope, 3; Indian, 147; Excelsior, 38; Harley-Davidson, 70; New Era, 5; Wagner, 2; M. M., 3; Merkel, 24; Yale, 29.

Battery equipped, 6 per cent.; magneto, 94 per cent.; 97 per cent. of the magneto equipped were fitted with Bosch instruments.

IMPROVEMENT CONTEST.

OWING to the pressure of convention news and the necessity of getting it into type while it is still fresh from the scene of action several interesting features were crowded out of this issue, among them the first batch of designs and descriptions in the Improvement Contest which was inaugurated in the issue of June 27. More than a score of creditable improvements were submitted in time for publication in this number and they will all appear, with a few later arrivals, in the issue of August 8.

There are four cash prizes, \$50, \$25, \$15 and \$10 waiting for the ingenious riders who submit the most desirable improvements for the standard motorcycle, and designs and descrip-

tions should be forwarded without unnecessary delay. Address them to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

BERKS M. C. RUN.

THE Berks Motorcycle Club, of Reading, Pa., will hold its first endurance run on Sunday, July 28, from North Ninth street, Reading, to Lancaster, Harrisburg, Lebanon and back to Reading. The run will be open to all riders and it is expected that about fifty will participate. Many riders from Philadelphia, Pottstown, Lancaster, Harrisburg, Lebanon, Allentown and Easton have entered. A gold medal will be given to each rider making a perfect score.

From CHICAGO to the BIG SHOW

CHICAGO, July 15.—Motorcycle tourists began flowing into Chicago on Saturday afternoon, mostly from points in Wisconsin and Illinois, while several were from far away cities, such as St. Paul and Minneapolis. A bunch came in Sunday from Milwaukee on the *Silent Gray Fellows*. Most of the boys spent Sunday in taking the 50-mile tour around the Chicago chain of boulevards. George McIntire, of Cleveland, shipped in to Chicago to make the big tour.

Considerable delay over details made the tourists a half hour later in starting; while they were scheduled to leave at 6 a. m., they did not get off until about 6:30. After the press men were on the job with their cameras, the boys lined up in pairs and soon were off. Michigan avenue was lined for blocks with the two-wheelers. The weather was bad for the photographers, and it looked as if rain would get the best of the tourists. The trip out of Chicago was led by Tourmaster Campbell, with Graham as his first lieutenant. Division "B" was piloted by George Puls, the smiling Harley salesman, on a new chain 7. Division "C" consisted of only four machines. About sixty-five machines in all left Chicago.

The First Rough Roads.

At East Chicago, the roads began to get rough. Here a bad spill resulted when one of the Flanders riders went down and two machines rolled over him. The machines were put in running order again and again joined in the procession. Bruno Stechard's front tire went bad on his De Luxe twin seven, the first evidence of tire trouble. Out of East Chicago the tourists hit muddy roads with puddles here and there, and skidding was common. Several riders were goggleless and many sore eyes resulted, as the roads were dusty. Soon Hammond was sighted and Campbell, on a twin Harley, went to the wayside with a puncture in his rear tire. At Hammond a large crowd turned out to greet the riders and the live motorcyclists of the town were on hand to direct the tourists. Several of the boys stopped at a garage that bore the F. A. M. emblem for oil and gasoline. Out of Hammond fairly good roads greeted the tourists, and a hot sun beamed down on them. Dust covered machines and riders. Some sand was experienced and a halt was called by Tourmaster Campbell at a sharp turn to warn tourists of a change in route. The roads as scheduled were under reconstruction and this necessitated making a detour of a few miles into Hobart. At Hobart, some of the boys stopped for oil and gas and a few went through swinging doors; this was especially notable in Division "B," captained by Puls, from Milwaukee.

A Bad Sand Patch.

Out of Hobart, the tourists met trouble, as they ran into a construction gang repairing the road. A few of the boys went back and took a different road, while most of them went down off the road into a valley, a sort of a thick woods, and pushed around the sand, which appeared to be at least three feet deep. It took two men to a machine to make the lift; a derrick would have been more appropriate. The two-speeds spun their wheels in the sand and were simply overwhelmed, as the sand was too deep to get even a bite on the road. They, too, finally joined the pushing brigade. A stop was made to see that every one got safely around the torn-up spot. The *MOTORCYCLE ILLUSTRATED* automobile, which left Chicago, went back to Hobart for a detour.

Later, the tired tourists found a fine macadamized road, but to their dismay, it soon ended in a rutty road with plenty of dust. This continued into Valparaiso. Threatening clouds foretold rain, and the order went out to beat it as fast as possible and many thought that the run into Ft. Wayne would be impossible, as much time was lost on account of the road conditions. At Valparaiso a large banner read "Welcome F. A. M. Tourists." Out of Valparaiso a very fair macadamized road was found, but it was very dusty.

Almost a Road Race.

As the sky still threatened rain the boys rode faster and for a while it looked as if the Northwestern Tour would end in a road race. The boys hit up an awful clip for country roads for a stretch of 15 miles, averaging close to 45 miles an hour. The crew of the automobile piloted for *MOTORCYCLE ILLUSTRATED*, said that they made forty, and were unable to keep in sight of the fast-traveling tourists. About six miles out of La Porte, Ind., several La Porte riders met the tourists and escorted them into the city. Just before entering La Porte Turner, the Minneapolis tourist, broke a chain. This was quickly repaired by Turner, who knows the mechanical end of the game as well as the office end. At La Porte a short stop was made for the benefit of those who needed gas and oil. The La Porte M. C. was absent, although it was in the air that the drinks would be on the club. Several good fellows of the La Porte squad showed the tourists the way out of the town and started them on to South Bend.

After riding roads that were good, dusty, rutty and indifferent, the climax for the tourists came when a lake extended for 70 feet across the road, about three feet deep. This brought a halt and the riders considered it for a few minutes. Then Division "B" blew up, with Puls at the head. Puls looked for a moment at the stream and then decided to take a daring chance

and ford it with his Harley. Many of the boys said it was impossible, but Puls turned the trick. Although his magneto was under water, he negotiated the pond in good style. He was followed by three others, one of whom went down with his machine completely covered with water. One made the ford and the other pushed. It was then decided to take no chances and a detour through a cornfield was necessary. This brought out the farmers, who evidently did not like motorcycles and threatened arrest if the boys kept on using their property for a public highway as they called it. Finally the farmers kept the boys from going around the stream, and it was a case of riding back twelve miles or walking through the water; and the boys walked, much to the surprise of the farmers. After draining the water from his carburetor, the lad who fell in the water got his motor going and all were under way once more over a fairly good road. The sun came out and the threatening clouds drifted away.

In South Bend at Last.

A little sand was experienced into South Bend. On arriving the boys all lined up in the public square in neat fashion and then scattered for dinner. After filling up with gas and oil, they started at 1 o'clock. Out of South Bend the route was very narrow and dusty, with a ditch four to six feet deep on each side of the road. More than one tourist took the ditch route. A passing automobile would not give an inch to the boys, and it was a case of stop and let the car go by; several took a chance and passed by a hair's breadth, but no serious accident resulted. More tire trouble was experienced at this point, and several riders were passed tinkering with machines. One rider, who was absent-minded about fuel, had the pleasure of stopping the *MOTORCYCLE ILLUSTRATED* car for enough gasoline to run into Elkhart where he filled to capacity. Into Elkhart the roads were fine. George Puls took a graceful slide getting into town and his riding pals gave him a big laugh.

Out of Elkhart there was more dust and the weather gloomed up again and looked like rain. A stretch of crushed rock, with the appearance of being very fresh, cut many a tire and a good many riders took to the grass along the side of the road. Soon the tourists found themselves going into Goshen, where the largest crowd of the day turned out to meet them. Evidently the newspapers had the dope in advance; at any rate the Press Man was swamped with inquiries. After a short stop, during which Tourmaster Campbell conferred with the town constable, a kind hearted old gentleman, he ordered all machines and vehicles other than motorcycles to clear the way for "them there motorcycles," and once more they hit the roads. The roads were of the rutty kind and very

dusty. The riders strung out in single file, it being dangerous to ride in pairs on account of the bad going. This lasted for several miles; then came more crushed rock for a quarter of a mile.

Tanks Filled at Ligonier.

About three miles from Ligonier M. S. Hersey, of Alben, met the tourists and led them into the town, where they stopped for gas and oil. A bunch of the boys feasted on a half bushel of apples donated by Puls. After a delay of twenty minutes, Mr. Hersey led the boys over a fine soft dirt road into Churubusco, where he wished them good luck and started back to Ligonier. Only a three-minute stop was made at Churubusco. Out of Churubusco the tourists hit an oiled stretch and skidding was common. Over fine roads of macadam and hard clay, the boys struck a clip of 45 miles per hour. Finally E. R. Francis, of Newark, Ohio, on a Harley, met Tourmaster Campbell and they beat it into the outskirts of Ft. Wayne, where they stopped and waited for the bunch of dust-covered but happy Northwesterners to pair up. Just before the squad landed on the main street rain began to fall. The Anthony Hotel got a large percentage of the tourists, while the Wayne was the real home of khaki suits, red bandannas and tassel caps.

That Downpour of Rain.

Ft. Wayne, Ind., July 16.—Oh! you second rain on the heels of the night's cloudburst! The start was a half hour late, it being eight o'clock when the boys got away. Several of the riders had punctures early in the day, but the rest kept the pace set by Tourmaster Campbell, it being slightly slower than the previous day as the mileage was forty miles shorter. The roads were full of puddles and it was a case of you splash me and I splash you. The automobiles were soon left far behind by the tourists, and here it was demonstrated that the motorcycle could make better time than the automobile on bad roads. A lad named Shipp, on an Excelsior single, skidded and went down and R. H. Martin, on a big seven, had the pleasure of running directly over the Excelsior and going off the road into a ditch with badly bent pedal crank and handlebars. The roads continued muddy and the boys eased up somewhat. Soon Van Wert was sighted, where a short stop was made. At Van Wert the newspaper boys were on the job and so was H. M. Bienz, with a large portable tank of gasoline. He escorted the tourists out of town for a distance of five miles over very watery roads. Delphos was passed without a stop and soon Lima was within a handshake. Several of the Lima riders met the tourists and led them into the town, where a band greeted them and they were invited to the clubrooms. The boys went, too. Here dinner was enjoyed. At 1:30, after a stop of two hours, the boys took to the road again.

Out of Wapakoneta the roads were very rocky; then came a stretch of mud. Some walked and some did the skiddy glide over the spots, while many took flops. In Sidney the Sidney M. C. greeted the tourists with ice-cold tubs of bottled soft drinks and the gang surely took to the bottles. After a cheer for the Sidney squad, the riders headed for Piqua over fairly good roads. The sun had, in the meantime, im-

Purdy, Wickwire and Dudley Smith, Who, Riding Indians, Made the Journey Between Chicago and Columbus in One Day. They Were on the Road Seventeen Hours.

proved the muddy roads somewhat. In Piqua the boys were greeted by an F. A. M. member with a camera, who took a seven-foot photo with the promise of bringing it to Columbus. After the Piqua M. C. had distributed five large baskets of cheese, ham, egg, hamburger and salmon sandwiches, the boys rode on into Troy, where a Dayton M. C. bunch in an automobile and several motorcyclists met the tourists and informed them that a different route would be necessary to get into Dayton as a bridge was closed on the route as scheduled.

From Troy the roads were of the bumpy sort and exceedingly dusty. At Ebernezer the automobiles made a roundabout run into Dayton, but the motorcycles continued and went over the bridge that was supposed to be closed and waited outside of Dayton for the automobiles. At Dayton the boys lined up at the Algonquin Hotel. Machines were garaged and the riders went to hotels. The Algonquin was the official hotel. At Dayton about thirty-five riders joined the 125 already in line. Miss Helen White, of Indianapolis, was on hand with her Pope to make the trip with the crew into Columbus. She had ridden down from Indianapolis. Mrs. O. W. Rockfield and Mrs. F. M. Siler rode tandems with their husbands.

On the Last Leg.

Dayton, July 17.—Today the last stretch was before the boys and they were eager to get to the Convention City, but Tourmaster Campbell called a start by twos at short intervals. Jacobs, the New Era rider, captained Division "E" out of Dayton. The lunchroom across the street from the Algonquin was crowded with the boys who were late getting out of the hay. Outside of Dayton a stretch of very muddy roads bothered a number of riders. Tourmaster Campbell fouled a plug and was left behind for a few miles, but he soon breezed to the front. One rider, on an Excelsior single, got six punctures in a row and was delayed. From mud to dust and ruts was the order of the road; then came a hill with stair steps that made the one lungers hump some and the big twins take flying leaps into the air. Plenty of puddles also were found. Large crowds were on hand to see the boys join Baker's squad of speedsters from Indianapolis. Many of the Columbus boys were at Springfield to escort the combined body of southwest and northwest tourists to the Convention City.

List of Chicago Starters.

ANNUAL LISTER OUTING.

CLEVELAND, Ohio.—The Lister Motorcycle Company, distributors for Harley-Davidson and Flying Merkel machines, recently gave their annual chicken dinner to the boys riding their makes of machines. About 150 machines lined the block near the Lister establishment early in the morning and after a line-up for a photograph, they were led by "Bill" Lister over a joy ride on Cleveland's chain of boulevards. The run ended on the Sprague road, at Mrs. Deitrick's chicken farm, where the boys spent some time in foot racing and other games while the chickens were being prepared.

A vote of thanks to the Lister Brothers was given by the boys, who then hustled back to the city in time to attend the races at Luna Motordrome in the evening.

A TRAFFIC ORDINANCE.

COLUMBUS, Ohio.—Motorcycles as well as automobiles and all horse-drawn vehicles are included in an ordinance recently enacted by the City Council of Columbus, Ohio, which requires vehicles to come to a full stop while approaching street cars discharging passengers. An exception in the interest of traffic is made in the case of downtown congested sections, where the vehicle does not need to come to a full stop.

COLUMBUS, Ohio.—The American Machine Co., 338 North High street, has contracted for the central Ohio agency for the Henderson.

Arrival of the Western Tourists at the Outskirts of Columbus.

How BAKER'S SQUAD *went Through*

SEVEN motorcyclists—dubbed “the lucky seven”—lined up for the start of the Southwest Tour at Louisville, Ky., on Monday morning, July 15, in front of the Seelbach Hotel. The start was made promptly on schedule time at 6 o'clock, for Tourmaster Erwin G. Baker, of Indianapolis, and the six other riders had been on hand an hour before starting time. The riders were jovial over the fact that there were just seven in the party; they took this for a good omen, which it really proved to be later on. There were not many people about the hotel when the start was made, and considering the number that started, and the manner in which they got under way, it can not be said that the start was “auspicious.” However, as the tour grew from day to day, the departures from the cities in which stops were made proved to be very interesting to hundreds of onlookers, and a good impression was created.

Helm in Hard Luck.

But to get back to the start—the “lucky seven” didn't remain seven very long. Those who formed the original “luck” group were Tourmaster Baker, of Indianapolis; William Helm, of Owensboro, Ky.; Frank Marshall, of Louisville; Peter Kline, of Louisville; Robert Sturm, of Indianapolis; Henry Pardom, of Owensboro, and Earl Trabue, of Mitchell, Ind.

It fell to the lot of William Helm to break the “seven charm.” Helm traveled about thirty miles from Louisville, and there he stopped. He didn't do it willingly, either, for he had expressed his desire before starting to win a medal for finishing. However, the gigantic hills of Brown County, Indiana, proved his undoing. Helm was riding a four-horse machine, and when he came to the steepest hill on the route—Snakey Curve, which is two miles long—his machine refused to climb, and he had to stop. There was nothing left for him but to turn back, as he didn't feel like using the “ankle express” on the many hills that were still ahead of him. Baker and the rest of the “lucky seven” tried to help Helm along, but after stopping for some time to see what they could do for him, the remaining six started on their way again, bidding their friend goodbye.

The trip through Brown County was by far the most interesting part of the Southwest Tour. It was a fact to be regretted that only a small number took advantage of the trip through that country, for, from a scenic standpoint, as well as from the standpoint of historic interest, nothing on the remainder of the trip to Columbus could compare with it. The six riders had a great time in the hills and they took their time, stopping at farm houses, and the little country towns along the route.

Refreshments at Bloomington.

The noon stop on Monday was scheduled for Bloomington, Ind., the home of Indiana University, which the tourists visited. In keeping with his plans to arrive at all points on sched-

uled time, and to follow the same rule when leaving, Tourmaster Baker brought his men into Bloomington on the dot, and they settled down for a good dinner at a bakery-restaurant, where all arrangements had been made by a press representative who followed the tourists. At Bloomington the riders found a garage where they renewed their supplies of oil and gasoline.

From Louisville to Bloomington the actual riding distance was found to be 96 miles, although on the tour sheet it was booked at 75 miles. The riders' actual riding time averaged a little less than 20 miles an hour, which was extremely good considering the hills. Four stops were made on the morning journey. The riders decided to alter their course a bit at the start of the tour and leave Louisville by the New Albany route instead of via Jeffersonville, Ind. It cost each of the seven riders 25 cents toll to cross the Ohio River at Louisville. The weather was great for riding, the hilly roads were good, and all the tourists were feeling fine when they reached Bloomington. They still believed that their “seven charm” would remain unbroken even though they had lost one of the original seven.

The good luck they were hoping for was again assured soon after they left Bloomington, for at Martinsville, they picked up Earl Potter, of Paragon, Ind., and once more the lucky combination ruled the tourists. Potter stuck all the rest of the way into Columbus.

On a Hilly Stretch.

Where the tourists had the most fun Monday was between Bloomington and Gosport. There were hills, and more hills, between these two towns, as well as many stone quarries, and the scenery was refreshing. The paths and roads followed by the tourists were winding, and it was with some difficulty that the riders kept to the best part of the roads. Just at the bottom of “Ole Snakey Curve,” on Taber Hill, was a creek. It was about thirty feet wide, but only a couple of feet deep, the bottom being of rock. Tourmaster Baker first waded across to work his kodak on Sturm, who was the first to ride across, or rather to try to cross the stream. “Bob” tried to cross, but his machine wouldn't “cut it” and he got stuck in the middle, while the others on the banks sat down and “kidded” him. Sturm got off his machine and pushed it across, and then it was his turn to watch the others try to ford the water.

Tourmaster Baker declared he knew “the only place” to cross, and waded back to get his machine. Needless to say, Baker got stuck also, and he finally resorted to the method used by Sturm to get to the other side of the stream. The other riders didn't attempt to ride but waded the whole distance.

The riders soon left Gosport, where they stopped for a time, and they enjoyed some beautiful scenery on the way to Paragon. About that time it grew dark and the tourists feared they would be caught in the rain which

was ahead, for the roads were muddy and hard to traverse. The seven miles to Martinsville were the worst of the whole Southwest Tour. As the six riders approached Martinsville about 4 o'clock in the afternoon they felt their good luck slipping and each one was prepared for the storm which was still a little distance ahead, and which had been heralded to them by many people along the route who had come from the opposite direction. A few drops of rain fell as they entered Martinsville, but before the looked-for rain could do any damage, Earl Potter appeared on the spot, joined the riders, put old “lucky seven” back in good standing again and saved the day. The boys went ahead then without fear. It didn't rain. The clouds rolled away, and the hearts of the tourists were glad.

In Indianapolis on Time.

The riders reached Indianapolis, the night stop, on scheduled time. They stored their machines at John Kinney's shop, and put up for the night at the Colonial Hotel. The men from Louisville traveled 165 miles on Monday, with their actual riding time averaging about 18 miles per hour. At Indianapolis the tourists were joined by almost forty others from all parts of Indiana, Ohio, Illinois and Missouri. These tourists, who were to make their start in the morning, also put up at the Colonial Hotel and garaged their machines at Kinney's. Mr. Kinney also furnished the tourists entertainment Monday evening and turned his spacious storeroom over to them.

Tuesday.—It was very gratifying on Tuesday morning to see forty-two motorcycles in line at the Soldiers' and Sailors' Monument, in Indianapolis, ready for the start of the second day's journey, which was to end at Springfield, Ohio, Tuesday evening. There were eight riders from Kokomo, Ind., in line for the start, and Baker appointed Noble Shepard, one of the bunch, a lieutenant. G. A. Scott, of Marion, and Calvin East, of Logansport, were also appointed. The St. Louis delegation joined at Indianapolis. There were five of the boys from that city, representing the St. Louis Motorcycle Club, and they were accompanied by three other St. Louis motorcyclists who made the complete trip in a Ford delivery wagon. They acted as the “trouble” car on the tour to Columbus and proved very helpful along the route. The men in the automobile were F. Greenfield, G. W. Duncan and H. Dyck.

Mrs. Helen White, of Indianapolis, joined the tour Tuesday morning and was the only woman rider on the trip. She now wears a medal for finishing on time. She proved to be a happy subject for photographers along the route and was photographed plentifully.

If the motorcyclists had been given the power to order “tailor-made” roads from Indianapolis to Springfield, and on into Columbus, they could not have asked for better roads than those they traversed on the remainder of the tour from Indianapolis.

Six South-Western Tourists.

Last Leg a Joy Ride.

There was just one road, the famous National road, which was used by the tourists on Tuesday and Wednesday, and the pike is one of the greatest in the country. This road led directly east, right into the convention city, and the riders couldn't have got lost if they had wanted too. Along the road all the way was an interurban line, and it was rather embarrassing to the motormen on the limited traction cars to see the motorcycles pass. There is no use denying the fact now that it is done, although the riders' instructions were to keep within the 20 mile per hour limit.

The second day's trip, while it was not a road race or speed contest, furnished the riders all the opportunity they cared for to do fast riding, and the fact that the tourists averaged 27 miles per hour for the actual riding time on Tuesday bears out the statement that there was "some going." However, there was not an accident that day or on Wednesday, and the last two days of the tour were uneventful.

To get back to the details of the run on Tuesday, the first stop the tourists made was at Cambridge City, Ind., where they replenished their oil and gasoline tanks. They reached Cambridge City at 9 o'clock, after starting from Indianapolis at 6:50. The distance was about 40 miles. From Cambridge City on to Columbus, it had rained the night before and rain had helped to make the roads more perfect.

Richmond, Ind., was passed shortly before noon and the tourists stopped forty minutes to look over Earlham College and to take a rest. Then they started to hurry on to Dayton, Ohio, passing through Eaton, on the way. The tourists reached Dayton at 12:30 and stopped at the Algonquin for dinner. A body of eighteen riders from Cincinnati, under the leadership of Olin Ross, had reached Dayton shortly before the tourists from Indianapolis, and when the combined body left for Spring-

field in the afternoon at 3 o'clock, there were over sixty machines in line.

The tourists reached Springfield soon after four o'clock, the distance from Dayton being 25 miles. The riders put up their machines at a number of the places provided by the motorcycle dealers in the town, and roomed at the Bookwalter and Arcade Hotels.

Word was given out by Tourmaster Baker that the body would move toward Columbus at 8 a. m. Wednesday, and the riders went to bed early. There was some disappointment expressed by the riders because Tourmaster Campbell was holding his men at Dayton over night, instead of bringing them to Springfield, as at first planned.

Wednesday.—As the southwest tourists were lined up at the public square in Springfield on Wednesday morning at 8 o'clock, Tourmaster

Campbell and his body of riders on the Northwest Tour from Chicago, dashed down the street unheralded and joined Tourmaster Baker's men. The Northwesterners rested a short while at the public square while Baker and Campbell conferred, and at a quarter after eight, Tourmaster Campbell led the body of 200 or more tourists out of Springfield.

As the riders went single file and about a 100 yards apart, it gave each one a good opportunity to "cut loose" in the country. As stated before, better roads could not have been asked for. The riders passed through Vienna, Summerford and West Jefferson. The latter town is just twelve miles from Columbus, and the macadamized road stretching all the way between the two cities was a real boulevard for the riders who reached the convention city tired, tanned and dusty—but happy.

**NEW MESINGER FACTORY.**

THE H. & F. Mesinger Manufacturing Co. is having erected a spacious new factory at 144th street and Austin place, New York, one block east of the Southern boulevard. The factory, which has 30,000 square feet of floor space, is of heavy mill construction throughout, and is particularly well lighted, so that first-class work will be facilitated. It will be equipped with new machinery, specially designed for the production of the Mesinger saddles. The first floor will be occupied by the offices, and there will be the employee's entrance and stock room in the rear, with the

freight elevator on the same side as the offices. The second floor will be given over to the machinery and stamping departments, while the third floor will be used for the leather department. On the fourth floor will be located the assembling and finishing departments. Coupled with the company's already extensive saddle business in America, which has made a new plant very desirable, an increasing export trade is a factor which promises to necessitate even further enlargement. The Mesinger, it is announced, will be standard equipment on Merkel and Indian motorcycles for 1913.

On the NORTH EASTERN Route

ALBANY, Friday, July 12.—When motorcyclists from eastern and southern New York and Massachusetts began to assemble here for the tour to the convention city the club rooms of the Albany Motorcycle Club were thrown open, and the local motorcycle agents co-operated to accommodate the riders. On Friday evening the Albany M. C. held a dinner and smoker, and the plans for the tour were fully explained by J. Matanley, acting tourmaster. F. L. Hunt, of Albany, was unanimously elected captain of the tour, and he appointed B. M. Spencer, of Attleboro, Mass., and Donald B. Goold, captain of the Albany Motorcycle Club, to act as lieutenants. The riders all retired early, in order to prepare for the long grind the following morning.

Off on Long Grind.

Saturday, July 13.—F. S. Ellett, tourmaster of the northeastern division, arrived at 3:30 a. m., and immediately perfected the itinerary for the first day's run. Wm. Hetherington, Jr., of Brooklyn, N. Y., was appointed checker of the tour. Promptly at 7 a. m. twenty-nine riders assembled in front of the clubrooms at 336 Central avenue, ready to start; among these were delegates from nearly all of the eastern F. A. M. clubs. Donald B. Goold and Howard Smith were delegates from the Albany Motorcycle Club. Each rider was checked out and a route card given him, after which the official photograph was taken. The riders then started in two sections, each in charge of a lieutenant. Tourmaster Ellett, T. Matanley, assistant tourmaster; F. L. Hunt, captain; B. M. Spencer, lieutenant, and eleven other riders constituted the first section, while Lieutenant Donald Goold and Checker Hetherington, with twelve other riders, composed the second section.

Each rider was distinguished by an F. A. M. arm band on his left arm and a large

Heavy Going at Mendon, N. Y.

numeral signifying the section he belonged to printed on the back of his coat. The riders were paired off, and in this way delays were eliminated. If any rider had trouble his riding mate stopped to assist him, and subsequent events proved that this was a wise move on the part of the tourmaster.

Good Roads at the Start.

Perfect roads were met with at the start, and the 25 piloting motorcyclists of the Albany M. C. set up a lively pace. Schenectady was the first stopping place, and here the division was increased by two additional riders. The photographs of the two sections of the division were taken, and then the journey was continued. The route then lay through Hoff-

mans, to Amsterdam, over splendid macadam roads. Just before entering Amsterdam, a long steep hill, which was very sandy, gave the riders no little trouble, due to the tourists riding too close together. The tourmaster's attention was drawn to this by the checker, and when the stop was made in the heart of Amsterdam the tourmaster instructed the boys to allow a safe distance between each pair of riders and reduce the chances of spills. The ranks of the tourists were here increased by an additional rider.

A throng of people had gathered in Amsterdam to witness the parade of the riders, and when the riders sped swiftly on the journey, all with mufflers closed, many of the throng were heard to remark on the absence of noise. The division was piloted through Amsterdam to the city limits by representatives of the local club. Five miles from Amsterdam rough roads were met with, and they continued until the town of Fonda was reached. An extremely bad, sandy stretch of road was met with just before entering Fonda, and here some of the riders had falls, none of them serious, however.

The Going Becomes Heavy.

From Fonda the roads became gradually worse, until a steep hill was reached just before entering Little Falls. Here the road was being reconstructed, and the riders were compelled to dismount and push their machines, loaded as they were with luggage, to the top of the hill. Some of the riders attempted to ride through the deep mud, and one man succeeded. Wm. Hetherington nearly succeeded in navigating the mud, but just as he was congratulating himself on having gained the top of the hill, his engine stalled and the machine fell over on its side with Hetherington sitting on the red-hot engine. The rider quickly scrambled from his warm perch, al-

Northeastern Tourists in Amsterdam, N. Y.

though not quite quick enough to prevent burning the seat of his pants. A short wait was made for the other riders to catch up, and then the journey was continued, the roads becoming better. The town of Herkimer was next reached, and here a dinner stop was made, as it was then 1 p. m. The riders at this point were one hour behind the schedule. After a thirty-minute stop the riders continued on through Illion, Utica, New Hartford, Oneida Castle, Chittenango, Mycenae, Fayetteville to Syracuse, over excellent roads. The schedule time was made up between these towns, and the riders arrived in Syracuse at 5 p. m., after having covered a distance of 153.1 miles for the day's run.

None of the riders had any trouble other than punctures. In the evening the Syracuse M. C. held a smoker for the tourists, and refreshments were bountifully provided. All the Syracuse motorcycle dealers cheerfully stored the riders' machines, filling them up with

gasoline and oil, and in numerous cases supplying small spares to the boys. After the smoker the riders returned to the Hotel Onondaga, the official headquarters, and retired. Promptly at 7 a. m. the next morning, after each man had been checked out, the riders moved away to the accompaniment of the good wishes of the Syracuse riders.

A Veteran Joins.

One tourist was added to the rapidly swelling number of riders at Syracuse. From this point the route led through Camillus to Elbridge and to Auburn, where a brief stop was made. At Auburn "Andy" Kraus, the Indian dealer of Auburn, joined the tourists. This gave the northeast division the distinction of having the oldest member in its ranks, Mr. Kraus having attained the ripe age of 57 years. His mount was an Indian T. T.

Between Auburn and Seneca Falls some very slippery and muddy roads were en-

countered. Here Howard Smith, who was riding a Flying Merkel machine, with J. Murdock as passenger, came to grief, taking a bad fall, and bending his engine shaft. With some difficulty the shaft was pounded back nearly straight, and Smith pluckily started on the trail of the riders. The bunch was held at Cayuga Lake by the ferry boat being on the opposite side of the lake. All the riders enjoyed the brief rest which the trip across the lake afforded.

After leaving the ferry the boys had a hard pull up a stiff grade, and the riders of singles had their hands full to negotiate the climb. By easing out their clutches, however, they managed to make it. The roads into Geneva were fairly good, at which point four more tourists joined the division, making a total of 38 riders. At 10 a. m. the division was on its way to Canandaigua, the riders being 45 minutes behind the schedule. Tourmaster Ellett led the boys at a lively pace,

Northeastern Tourists in Erie as the guests of the Continental Rubber Works.

in an effort to regain the lost time, but the roads would not permit of any speed, being rough and rutty, and the boys fell further behind the schedule.

Through Canandaigua, Holcomb, Menden and Pittsford, the roads were what might be called fair. Here some of the riders began to have trouble. B. M. Spencer, lieutenant of the second section, broke two chains and had a hard fall. The machine was not damaged, but there wasn't much left of the headlight. W. Worth, one of the Yale riders, experienced engine trouble, and T. J. Conroy towed him back to Syracuse, where repairs were hastily made, and then the riders "beat" it to regain their division.

Spills Break the Monotony.

W. Hetherington, Jr., broke a driving chain at Pittsford, and had to wait for the next rider to catch up in order to borrow a chain link. In crossing the barge canal bridge into Rochester, C. Rohver, riding an Excelsior, hit a large stone. He was thrown from his machine and his scalp was cut in three places.

"Feeding" the machines at the Continental Rubber Works in Erie.

Teasdale came in for his share of hard luck when he collided with a delivery wagon. Fortunately he escaped without injury, the only damage being to his steering head. Floyd Cox got tangled up with an auto, breaking the forks of his machine, which was rushed back for repairs, and Cox joined the division the following morning. To do this he was compelled to ride from 3:30 a. m. He was not injured.

Rochester Had a Booster.

At Rochester the division was re-enforced by one rider. Talking about Rochester, that excellent city never remained long in obscurity, due to the efforts of "Doc" Levis, who never missed an opportunity to impress upon his fellow riders the merits of his home town. Sad to relate, Doc, due perhaps to his linguistic bent, did not pay enough attention to the proper adjustment of his spare parts, which he consistently shed along the road.

From Rochester the route lay over excellent roads to Scottsville. Here Lloyd Benjamin became homesick and bade farewell to his brother tourists, and started home. From Scottsville to Sand Hill the roads were good, despite the ominous name of the town. Over winding roads, in fine condition, through some

beautiful scenery, the division swiftly sped on its way. At one point the railroad tracks ran parallel to the road, and as the riders caught up with a train each man saluted by cutting out his muffler. The train crew returned the salute by blowing the whistle of the engine. The roads gradually became better, until some of the smoothest, hardest roads that were ever built tempted the riders to investigate the speed possibilities of their respective mounts.

The towns of Garbutt, Caledonia, Leroy, Stafford, Batavia, Pembroke, Clarence and Williamsville, were quickly left behind, and in a compact body the division rode into Buffalo, two abreast, making a splendid impression. Not a sound of a muffler cut-out was heard. The arrival at Buffalo was only 10 minutes behind the schedule, the miles of splendid roads having allowed the time to be made up. The Buffalo M. C. gave the riders a splendid reception. Refreshments were plentiful. In the evening the riders all attended the club smoker. Mileage for the day, 196.5.

Harry Mapp (extreme right) and Merkel and Baxter side-car, just before leaving New York.

ing riders an extra good time, and the riders fully appreciated it.

The wives of the officials of the Continental Erie Company served the banquet, and saw to it that every rider received the limit in good things.

After the banquet gasoline and oil tanks were replenished, and tires and supplies were given to those who needed them. A photograph of the riders was then taken in front of the factory, and the division sped away on the next leg of the journey, after thanking Mr. Surré and the ladies for the fine reception they had received. Chas. Imhoff, who had ridden from Albany, decided that Erie was far enough for him, and dropped out. Three riders joined the division here.

Tourmaster Ellett in Trouble.

From Erie the route led through Fairview, Girard, East Springfield to Conneaut over very good roads. F. S. Ellett, tourmaster, broke the driving chain of his machine twice at this point, and Arthur Ferris and wife had a slight spill. Donald B. Gould, lieutenant of the third division, broke the spark control wire on his machine, and obtained a piece of binding wire from a nearby farmhouse, and made temporary repairs until he reached the next town.

From Conneaut the roads became sandy until Ashtabula was reached. Here a mile

Ed. Kaiser, a New Era tourist.

3. Tourmaster Fred S. Ellett, of the Northeastern Division.
4. A repair by the roadside.

3

4

stretch of deep sand caused the riders a few anxious minutes. M. M. Matanley, assistant tourmaster, hit the sand going fast, and his machine turned turtle, breaking the rear forks and hub. Mr. Matanley fell in the sand and was uninjured. The machine was shipped back and Matanley rode into Cleveland via train. Only thirty-one riders arrived at Ashtabula on time, the others being scattered. From Ashtabula the roads were fair. The division, which now numbered sixty men, in four sections, tried to keep riding in order, but the poor roads made it impossible going into Painesville. The second and third sections became lost, making a detour of ten miles and coming back almost to where they started. Doc Levis had his pennant pinned to his back, as he thought that would be the best place for it. He had obtained a new inner tube at Erie, and when he attempted to remove his coat at Painesville, he found his tire fastened to his coat. At Painesville a heavy storm overtook the riders, and they were thoroughly drenched before they could obtain shelter. One of the Indian riders fell on the oily road and broke the glass in his crankcase, letting the oil run out. He quickly inserted a half dollar in place of the glass and rode into Cleveland that way.

To Cleveland in the Rain.

From Painesville to Cleveland, 35 miles, it rained continuously, and a number of short-circuited magnetos gave trouble to some of the riders. Only 22 riders arrived on time at Cleveland, the first being B. A. Swenson and wife with side-car; M. Gale and wife, with Yale "Sociable," B. A. Spencer and R. Ronald. The last man to check in on time was Wm. Hetherington, Jr., who had been leading until the city limits were reached, when his magneto short circuited, and a half hour's delay was caused. The stragglers came in gradually. Tourmaster Ellett, Captain Hunt, Lieutenant Weatherbee, and five members of the first section arrived at 6:45 p. m. Some of the men did not arrive until starting time the next day, while a few never reached Cleveland.

B. A. Swenson lost his mudguard coming into Cleveland, and a few of the boys had pedals broken, due to skids on the slippery roads. At one point eight riders were tangled in a mass, and considerable difficulty was experienced in untangling the machines. No one was hurt, and the machines only suffered minor damage. H. J. Levis experienced a loss of compression at 8 o'clock at night, out in the country, and slept alongside the road-way all night, as he was too tired to push the machine to the next town. In the morning he found a farmer's home nearby, and left the machine in the barn and rode in on the train.

The Cleveland M. C. gave the boys a fine time in the evening, holding a smoker and dinner. Free tickets were given to the attractions at Luna Park, and exhibition races were given by Russell Smith and other riders at the Motordrome. Total mileage for the day, 202 miles.

Cleveland to Zanesville.

Thirty riders of the Cleveland M. C. joined the tourists here, and were assigned to the third, fourth and fifth sections. At 8 a. m. the tourmaster started each section of riders at two-minute intervals after each man had checked out. Good roads were looked for, but never found. Mud and water, which covered the machines and riders, caused much

discomfort. Very bad roads were encountered between Richsville and Ghent. Mrs. B. A. Swenson walked through the mud while Mr. Swenson drove the side-car. Some riders fell in a foot of muddy water which completely covered the roads, and they had trouble in starting their machines due to water in the magneto.

One of the riders of a belt-drive machine slipped his idler in order to better make the long pull up a muddy hill. His belt became so hot as to smoke, and he ran into a farmhouse and obtained a pail of water with which to cool the belt. Passing through the town of Cuyahoga the roads were so bad that some of the riders resorted to sidewalk riding. The town constable caught the first man, and a ten-dollar bill was left at the court to cover the cost of the experience. The roads became a little better going into Akron, Ohio, and the leaders of the sections attempted to get their men through on schedule time. Arrival time at Akron was 11 a. m. for the first rider, one hour and twenty minutes behind the schedule, and up to 12 o'clock noon only 18 riders out of 106 who were then in the run had checked in. Goodyear and Goodrich tire pennants were distributed to the boys by factory representatives, and at 12:30 p. m. the journey was resumed.

From Akron to Springfield.

The roads were poor from Akron to Springfield, through Uniontown, Greentown, New Berlin and Canton. From Canton the sections of the division became separated, due to no signs being posted on the roads, and different routes were taken to Zanesville. J. Sullivan, who had been conspicuous throughout the run from Albany by wearing a Panama hat, left Canton for Zanesville, and rode twenty miles. Much to his surprise he came back into Canton. After a few kind remarks about Ohio signs, he was directed on the right road, and arrived safely at Zanesville one hour behind the first section of riders. The first, third and fifth sections were in one division, while the other sections were split into small parties over the country roads.

At New Philadelphia, A. Gingras, who had rejoined from Buffalo, and Wm. Hetherington, Jr., checker of the tour, organized the riders into one section until twenty men had been assembled. In this order the riders set out for Coshocton, a distance of 44 miles, and at 4:30 p. m. they came in in a body, much to the surprise of Captain Hunt and his squad, who only had three men who had maintained their order in the ranks. At 5 p. m. 35 riders had arrived at Coshocton, and as 33 miles had still to be covered before arriving at Zanesville, Tourmaster Ellett gave the word to proceed. Not being familiar with the road, Ellett did not see a sharp turn over a bridge, and had a severe fall which shook him up and broke the pedals of his machine. This caused a delay of 45 minutes, and as darkness was fast approaching, a lively pace was set up by the leaders over rough, sandy roads which wound around steep hills with many sharp turns. Due to the darkness and dust it was anything but agreeable to navigate the sandy stretches. Some riders wanted to sleep in the barns along the road and continue in the morning, but the tourmaster urged all of them to stick to the few remaining miles.

Tourists Fagged from Hard Run.

Gale, on his Emblem, with his wife as passenger, ran out of gas five miles from Zanesville. He obtained some kerosene from a

nearby farm, and continued into town. The riders arrived at Zanesville at 2:30 p. m., 30 strong, completely tired out from the arduous day's journey. The Zanesville M. C. gave the boys a royal welcome, storing the machines, and each rider had a bath in the Masonic Hall, which had been obtained for their use. Up to 1 a. m. only 52 riders had arrived at Zanesville. Mileage for day, 176.

Promptly at 7:30 a. m. the riders on the northeastern division, who had been joined by 50 riders on the southeastern division and five Zanesville boys, started on the morning's run into Columbus, a distance of 52 miles. A brief stop was made at Hebron, where five more riders swelled the ranks. Five of the Columbus M. C. boys had ridden over to pilot the motorcyclists to Columbus, and in squads of twenty each the riders silently sped out of Zanesville. For a distance of five miles fair roads over rolling country were met with, and the riders were beginning to speed up for a fine run into Columbus. The rain of the night previous, however, had turned the ordinarily poor road into a quagmire, and the ranks of the riders became hopelessly disarranged. Walter Savery, on his Indian T. T., hit a hole full of water, and was pitched over the machine into a ditch and the machine fell on him. It took four men to pull him out from his precarious position, none the worse for his experience. Wm. Hetherington, Jr., also had a bad spill, falling into a puddle and suffering severe bruises on his legs. His machine was not damaged except for a broken pedal.

Donald B. Goold, who was riding between the tracks of the traction line, saw an approaching car in time to get out of the way, but J. F. Leuer, who was directly behind him, riding a 4 h. Thor, was not so fortunate. He saw the car too late to save the machine, and had to leap for his life. He escaped uninjured, but his machine was ground under the car, wrecking it completely. The broken machine was loaded into the ambulance car of the Indiana Four States Tour Automobile Club, which was passing at the time, and Leuer rode on in the automobile.

Skids, Spills and Punctures.

C. W. Burke broke down with punctures and a broken clutch. Chas. Good bent the forks of his machine when he fell into a hole. Emendorfer had five punctures in as many miles. Arthur Ferris and wife were out at Cleveland, mud causing them to discontinue the trip. Several minor accidents, skids and collisions proved that the route from Zanesville to Columbus was anything but a pleasurable journey. At noon 50 men of the northeast division, and 35 men of the southeast division had checked in at the Hotel Virginia, the official headquarters of the F. A. M.

B. A. Swenson and wife and M. E. Gale and wife, who came through with a side-car and a "Sociable" had an experience which they will long remember. The side-cars proved that they were able to navigate anything that a two tracker could stand, but the going was bad. Howard Smith and H. Murdock, who came through from Albany on a Flying Merkel, with tandem attachment, also put up a very creditable performance. F. Price, 17 years old, the youngest rider on the tour, ploughed through the heavy going on his 7 h. Indian like a veteran.

Throughout the trip comparatively little tire and engine trouble was experienced by the riders, nearly all of the damage being due to spill and broken chains. While the

Arrival of Part of the Eastern Division at the Virginia Hotel in Columbus.

F. A. M. classed this trip as a tour of pleasure for the riders, it might properly have been featured as an endurance run on this division. The total distance covered on the last day was 60 miles. Total distance covered 787 miles.

Joined at Albany.—F. E. Ellett, tourmaster, Yale 7; J. Matanley, assistant tourmaster, Excelsior 6; F. L. Hunt, captain, Indian; R. Weatherbee, lieutenant first division, Indian; Donald B. Goold, lieutenant third division, Thor 7; B. M. Spencer, lieutenant second division, Indian; Wm. Hetherington, Jr., checker, Indian 7; Walter Savery, Indian; B. A. Swenson and wife, Indian 7 and sidecar; Dr. H. L. Levis, Indian 4; F. L. Stevens, Yale 7; H. Crosbie, Yale 7; C. Reichy, Yale 7; J. Vedder, Thor 7; Lloyd Benjamin, Excelsior 6; P. Miller, Flanders 4; I. Sullivan, Indian; Harry Mapp, Merkel 6 with sidecar, M. Ullman as passenger; C. R. Greene, Indian 7; T. Conroy, Indian 7; J. Reynolds, Thor 7; R. Jones, Indian 7; S. Whittaker, Indian 7; P. Westcott, Indian 7; L. Wheeler, Indian 7; H. M. Gingras, Indian 7; Howard Smith and L. Murdock as passenger, Merkel 6; J. Imhoff, Indian 7; R. Worth, Indian 7.

Joined at Schenectady.—C. Rogers, Indian 7; C. W. Burke, Merkel 6. Joined at Amsterdam.—Brunnell, Indian 7. Joined at Utica.—R. Rizika, Monarch 5; P. Roth, Monarch 5; Prosper Jenny, Harley-Davidson 4; E. Nelbach, Monarch 5; Arthur Ferris and wife, Harley-Davidson 7.

Joined at Syracuse.—I. Ruhl, Indian 7. Joined at Auburn.—H. Kraus, Indian 7; W. L. Sherman, Indian 7. Joined at Geneva.—P. Allen, Merkel 6; C. Rohrer, Excelsior 4; R. Burgess, Merkel 4; C. Teasdale, Indian 7. Joined at Canandaigua.—I. W. Schutte, Indian 7; Floyd Cox, Emblem 7. Joined at Rochester.—Earl Ellsworth, Indian 7.

Joined at Buffalo.—Wm. M. Gladish, Excelsior 7; Dean Richmond, Indian 7; H. E. Krouse, Indian 5; C. Dahman, Indian 7; F. C. Blankshine, Emblem 7; F. J. Marshall, M. & M. 4; N. Chambers, Indian 7; H. C. Witt, Indian 7; Wm. Rychman, Indian 7; F. Collier, Excelsior 6; H. Evans, Thor 5; T. Pickard, Minneapolis 9; E. L. Kerr, Indian 7; R. Rohlfs, Indian 7; W. Benzie, Thor 4; M. Ronald, Thor 5; A. M. Weiland, Harley-Davidson 4.

Joined at Evans Center.—M. E. Gale and wife in Emblem 7 and special tandem. Joined at Erie.—W. J. Fuermann, Harley-Davidson

7; N. M. Neilley, Harley-Davidson 4; G. C. Unruh, Merkel 4.

Joined at Cleveland.—S. W. Bliss, Indian 7; C. F. Miller, Harley-Davidson 4; W. J. Lister, Harley-Davidson 4; H. Anderson, Yale 7; C. W. Dickason, Merkel 6; H. A. Dickason, Merkel 6; E. J. Emendorfer, Excelsior 4; Wm. J. Ferris, Jr., Harley-Davidson 4; H. L. Enos, Excelsior 6½; N. H. Hauck, Pope 4; O. W. Blackman, Harley-Davidson 4; Wm. Thomas, Merkel 6; Chas. A. Merkel and wife, Pierce 7; C. J. Stahl, Indian 7; Wm. F. Smith, Indian 7; G. W. Williams, Indian 7.

Joined at Cleveland, from Lorain, Ohio.—G. W. Williams, Indian 7; J. H. Kinzle, Indian 7; Tony Carek, Indian 7; Chas. Good, Indian 7; E. L. Gault, Indian 4; Geo. Erving, Harley-Davidson 4; Harry Johhs, Wagner 4; F. Ganoe, Indian 7; F. Mackert, Harley-Davidson 4; K. F. Halblaub, M. & M. 6; J. Leuer, Yale 4; F. Mittendorf, Harley-Davidson 4; C. T. Robbins, Indian 7; C. Rawson, Indian 7; E. G. Walbourn, Merkel 7.

Joined at Akron, Ohio.—A. G. Moranville, Indian 4; A. R. Cover, Indian 5. Joined at Canton, Ohio.—H. George, Excelsior 6; Alfred Lewis, Harley-Davidson 7. Joined at

Zanesville.—F. Rieman, Indian 7; J. I. Sharpe, Yale 4; C. E. Parker, Indian 7; E. L. Atwell, Yale 4; E. R. Crawne, Yale 4; Earl Garrett, Indian 7; F. Price, Indian 7; Donald Reimer, Excelsior 6.

Columbus boys who rode over to Zanesville to pilot the northeastern and southeastern divisions into Columbus.—H. D. Woolley, Indian 7; J. F. Miller, Indian 7; J. Yates, Indian 7; M. France, Indian 7; F. Hammell, Indian 7.

Joined at Hebron.—Chas. McGough, Harley-Davidson 7; J. Fromholtz, Indian, 5; Wm. Gallagher, Harley-Davidson 4; W. Renney, Yale 6½; Roy Hansen, Harley-Davidson 7; F. Gruber, Indian 7.

The following men checked in at Columbus on Wednesday, July 17, in the order named: Ellett, Robbins, Hunt, Kinzle, Weatherbee, Rohlfs, Hetherington, Savery, Lister, Carek, Miller, Drude, H. A. Dickason, C. A. Rawson, Mittendorf, C. F. Miller, Rogers, Cox, Hauck, C. W. Dickason, Williams, Vedder, Cover, Lewis, Jenny, Sherman, Moranville, Sullivan Swenson, Crosbie, Stevens, Reichy, Halblaub, Gingras, Gale, Goold, Bliss, Gault, George, Blackman, Ruhl, Conroy, Wheeler, Walbourn, Burke, Fuermann, Hansen, Kinney, Greene, Miller, Woolley, Roth, Smith, Good, Fromholtz, Gruber, Rennor, Atwell, Sharp, Cramer, Whittaker, Spencer, Merkel, Thomas Chambers, Neilley, Unruh, Rychman, Witt, Smith, Weiland, Pickard, Kerr, Benzie, Ronald, Evans, Dohman, Burke, Ellsworth and Reynolds. All the other men checked in the following day except these men, who were out due to accidents, M. Matanley, H. Krouse, J. F. Leuer, Arthur Ferris and Harry Mapp.

One hundred and twenty-six machines, carrying 131 persons, made up the northeastern division.

NOVEL COURT SYSTEM.

A MINNESOTA sheriff, A. A. Langum, has conceived the idea of a complete court—judge, sheriff, deputies and clerks—on wheels. In other words, he wants the officers to travel about the county in automobiles and motorcycles, arrest, try and pass judgment on all speed offenders and vagrants on the spot.

Start of the Parade in Connection with the Columbus Meet.

LOG' of the BALTIMORE DIVISION •

THE Southeastern tourists made a good start on Sunday morning, but not as early as was scheduled, as the Philadelphia boat, on which were two of the Camden riders and one from Philadelphia, did not arrive until 8:30 a. m. Tourmaster Robison took advantage of this delay by sending out the early risers, under Lieutenant Wix, of Baltimore, with instructions to wait at the top of Soult Mountain.

On Saturday afternoon the out-of-town riders began to appear at the Indian Wigwam in Baltimore. About 5 p. m. George Gilmer, of Charlottesville, Va., came in worn out from a ride over indifferent roads, having been caught in a thunderstorm on the bad part of the road from Washington. He was immediately dubbed "Old Virginia" by the riders, and his quaint and humorous sayings along the route made him a favorite with the riders. John W. Howell, of Philadelphia, was the other arrival, about 8 p. m. He had a bad trip also, as the sand is several feet deep for nearly ten miles near Elkton, Md. Like Gilmer, he had his share of rain.

On Sunday morning the following riders from Baltimore lined up for the start: Tourmaster J. A. Robison, First Lieutenant Wm. Wix, August Zimmerman, Sam Ambach, John W. Howell, of Philadelphia, Pa.; "Isa" Dick, of Philadelphia; John G. Ledyard, of Camden, N. J.; W. Heckerhorn, of Camden, N. J.; Geo. Gilmer, Charlottesville, Va. Howard A. French had transformed his Pullman automobile into a trouble car and had made arrangements to carry a number of parts and tires. Through the courtesy of the Goodyear Tire Co. a supply of casings and tubes was provided.

Those in the automobile besides French, who did the driving, were Miss Margaret Mace, Mrs. H. A. French and Frank Olmstead, manager of the Baltimore Goodyear branch.

The Mountain Trip.

At Frederick three Washington riders, Geo. W. Beall, P. N. Moulden and W. R. Morrison, joined the run. The two mountains in Maryland, the Catocin and the South, were easily ascended, and the riders found a large contingent of Hagerstown and Chambersburg riders to escort them to Hagerstown for dinner. Owing to the lateness of the arrival, due to the boat trip of the Philadelphia riders, it was decided to make a short cut to Mercersburg, which cut off five miles of bad roads and unfortunately left Chambersburg out of the run. Two of their riders had, however, already left for the West, and the Chambersburg riders again played escort to the foot of Cove Mountain. Shortly after this Morrison was picked up by the trouble car with a bad cut in his tire. He was quickly fixed up. In the middle of the next mountain Moulden was found with a sticking exhaust valve and in his hurry to get away he did not get it to seat properly and was taken in tow by Morrison.

About ten miles from Everett the riders ran into a fierce mountain storm which caused much trouble for the riders in the red clay bottom along the Juniata River. Here "Isa" Dick took a spill and did a regular circus act in the air, landing on a soft mud spot, while Heckerhorn went down ten feet of bank into the river. It was hard going plowing through the muddy bottom, and the next rider to be picked up was "Old Virginia," who was doing some tall skidding, his long legs being helpful in acting as props to hold his motor and himself up. It was growing dark by this time and Gilmer, Moulden and Morrison wisely decided that they would not do any skidding in the dark and put up at Everett for the night.

An Emergency Dinner.

The proprietor of the Waverly Hotel proved himself a hero. All the help had left

ened by this time and nothing could stop them. Several miles from Laurel Ridge another storm was encountered, but the going was good till the noon stop at Ligonier and the riders did not mind the rain much. The State of Pennsylvania is doing some grand road building, and at the rate it is progressing the National Highway will soon be a realization of the motorist's dream.

Up Laurel Ridge the going for the most part was exceedingly rough, the road builders being at work, but the west side was a dream, and many of the riders took advantage of the SPEED SIGN, on which was distinctly painted: "Speed Limit, 75 Miles per Hour," and one could attain this gait in the three-mile coast. Everybody was in on time for a good dinner at Ligonier, but just out of Greensburg they ran into another storm, and there was some tall skidding over the rotten

Harley-Davidson Dealers Who Participated in the F. A. M. Tours.

for the evening, but he and his daughters put up one of the nicest meals of the whole trip. All the tables were put together and there was a regular family gathering around the board. Many incidents of the trip were related and the boys were soon off for bed, the Bedford Mountain air not being needed to induce slumber. The day's run was a hard one over five mountains and miles of loose stones.

All the boys were up bright and early the next morning, but not too soon for the riders who had put in the night at Everett. The riders had good going over the first mountain, which was simply a joy ride, but they struck some indifferent roads for 25 miles, several miles of which were torn up preparatory to road building. Stoystown and Buckstown were quickly passed through, and the riding for several miles on top of the main ridge was greatly enjoyed, although this was very sandy in spots. The riders were hard-

roads leading into East McKeesport. Most of the riders beat the storm, but Howell, Zimmerman and Heckerhorn got lost in the woods and after fording several creeks, which had become much swollen in the mining district, finally got straightened out and beat it into Pittsburgh. Beall and Moulén, who had tarried on the mountainside, got drenched to the skin in their effort to make up the lost time before dark.

"Trouble Car" in Trouble

At Ligonier Fred Mertens, of Pittsburgh, joined the run and piloted the tourmaster and his party into the smoky burg. It was well that he did, as this was some job, although the Indian agent at that place had placed tour signs bearing the words "F. A. M. Tour" from East McKeesport in. The "trouble car" lived up to its name on this day, as its magneto gave trouble and necessitated a stop at a garage in Greensburg, where the repairs were

made. Parts for the motorcycles were carried but not a single part for the "buzz wagon," which finally pulled into Pittsburgh at 9.30 p. m. Most of the riders had arrived as early as 5 p. m. A large party left Pittsburgh the next morning, the riders lining up for an early morning picture, and the way they beat it out was a sin. Everybody seemed to have the speed mania, and soon one of the Pittsburghers was down with a deep gash in his knee.

Wm. G. Horn and Jas. Hepburn had left Baltimore on Friday. Hepburn was suffering from blood poisoning in one of his arms, but was determined to make the trip, accompanied by Horn, who had decided to go by easy stages on account of his partner's injuries. Samuel Congdon, of Baltimore, also joined the party, but his trip was short, as somebody not connected with the run took his machine out of the garage while he was at dinner and had such a bad smashup that Congdon was forced to forego any further riding. Shortly after leaving Washington Sam Ambach was found in a lonely spot, surrounded by a band of wandering gypsies. Sam was nearly exhausted from his efforts to repair a badly used up inner tube, and it was very hot in that lonely West Virginia country. Not a tree was near and the midday sun was beating down in all its fury. While Mrs. French

took a picture Miss Mace gallantly sprinkled talcum in the new casing, Olmstead doing the pumping and French and Ambach the repairing. After some refreshments from the welcome Thermos bottle Ambach was on his way. The "Rainmakers" ran into another one of the daily showers just out of Wheeling, which caused another supply of pedal axles to be brought out, but all escaped injury.

Dick Was in Hard Luck.

"Isa" Dick was the next rider to be found on the route. He had already put in one tube, and in his anxiety not to keep Ambach behind had apparently "pinched" it. This had to come out and another tube was put in. Then, being a little weak from his efforts in the hot sun and pretty tired from his already long grind, he unfortunately let his machine fall over, bending a crank. A little work on the mudguards and front fork put him on his way, and he was compelled to ride to beat the band in order to reach Zanesville before the gathering darkness overtook him, as he was then 40 miles from the night stop.

This day's riding was the best on the entire trip. The road to Washington was fine, but the next 25 miles was indifferent, with many loose stones and rocks. Generally the roads were good, although the innumerable water

breaks or "thank-you-ma'ms" made the high speed of the riders dangerous.

This trip was put down as a "pipe"; there were only 55 miles to cover and the boys were not in any big hurry to get off. The road was ordinary to within 25 miles of Columbus, when the "Rainmakers" ran into another storm which converted the yellow clay soil into a veritable quagmire and it was a hard job getting through. Wix, of Baltimore, took a header into the railroad track, while Miller, of Columbus, rolled down a steep bank with his machine, but fortunately came up smiling. This delayed the boys over an hour, and after getting on the good roads Zimmerman and Tourmaster Robison had a spill between them. Both came up with scratches, Zimmerman getting the worst of it with a lacerated arm and hand. There was no bottom to the mud, apparently, and what made it still worse was the "Four States Automobile Tour" plowing through in every direction and cutting it up so badly that the boys could not use the usual side path. Tourmaster Robison deserves praise for bringing every rider through the hard run, as every ridge in the Alleghenies was crossed, lots of sand was encountered and nearly 100 miles of loose stones and boulders were traversed. There was not a single mechanical mishap to anything but the trouble car.

SIDELIGHTS on the BIG TOURS

EX-TOURMASTER WHITNEY was on hand at the start in his "Sunday clothes" and was a welcome assistant to Tourmaster Campbell.

The MOTORCYCLE ILLUSTRATED crew was on hand in an automobile. They rendered valuable assistance to many a rider and were the official crank straighteners.

Whipple, "the Motorcycle Man," of Chicago, made the trip on his Flanders. He experienced tire trouble and had a nail imbedded in his tire in such a way that he was unable to detect it until after it had put three tubes out of business. He camped at South Bend the first night, Ft. Wayne the second night, Wapakoneta the third and arrived at Columbus at 7 p. m. on Thursday.

Harold F. Turner, general manager of the Minneapolis Motorcycle Company, was "one of the boys." He had a luggage carrier that was a record-breaker. He mounted a Big Five with two speeds.

Harper, on a Harley-Davidson, was one of the far-away boys. He hails from Miami, Fla. He was visiting the factory at Milwaukee and took in the run. His hobby is cleaning his machine with his handkerchief.

At East Chicago three riders in Division "C" came to grief when one spilled in front of the other two. Bent cranks and handlebars.

Harry Knutson, on a six Merkel, and his riding partner, Lee Staugaard, on an Excelsior seven, rode down from St. Paul on what they called a very sloppy road, and their machines looked it.

Marion, Ind., was not on the schedule for the first night's stop, but Fred Plock, L. J. Blunden and B. C. Bradford, of Pontiac, camped there. They were accompanied by W. H. Kallemeier, on a Harley, who had tire trouble. They beat it into Ft. Wayne for the start the next morning with the main squad.

Tire trouble was the jinx of the tour and nearly everybody had a taste of it.

Maurice Kahn, on a Flanders, hit a milk wagon at Thirty-first street, Chicago. He continued to Ft. Wayne and went to the hospital when his leg went bad. He thought at first that it would come around, but finally had to give up.

J. W. Atherton, of Moline, lost his way and went to Michigan City. Some motorcyclists not in the tour struck him and damaged his machine outside of Michigan City, and also injured Atherton a bit. The rider did not stop and Atherton got a dray to cart his machine into Michigan City. He shipped home to Moline, got dressed up by a physician and Pullmanned into Columbus. He said he would get there if he had to walk.

Puls made a noise like a brewery at every brass sign. He called a stop of Division "B" three miles out of Ft. Wayne and it cost him \$4.15 for the round.

McIntire was in a class with Tourmaster Campbell who cleaned his machine at each stop. They were threatened with disqualification, but they continued anyway. Someone

angered "Jes" by putting mud on his front mudguard.

J. R. Schutzner made a quick exit when a horse and buggy just ahead of him cut him off. A smashed headlight and a bugged up wrist were the damages. The driver apologized to Schutzner, who was peeved.

Huber Lee went to the starboard ditch on a sharp turn near South Bend. No damages, but he was shaken up somewhat.

Joe Desalvo, the De Luxe racing man, was continually looking for a spaghetti feed store, and he found it in Ft. Wayne. Some say that he camped on the ground, while others assert he left at 3:30 a. m. and left his order for more spaghetti at six in the morning.

Turner suffered a broken pedal chain which he quickly repaired. He carried "some" gasoline and oil tanks.

At Ligonier the gasoline was certainly dashed out some. Five men on the job and the machines drank hearty.

Talcum powder was used extensively, but too late to prevent Jesse Campbell from spoiling his complexion. One rider carried his talcum supply in one hip pocket and a bottle of almond cream in the other. Someone pulled the cork on the almond cream and—well, you can guess the rest.

P. F. Lombart damaged a dog going into Ft. Wayne. He says he bets that particular dog won't chase a motorcycle again.

The boys had a race outside of Ft. Wayne. Not with motorcycles, but with two young

Just a Small Percentage of the Enthusiastic Participants in the F. A. M. Meet in Columbus Last W

calves that had never seen one of "them there motorcycles" before; they finally admitted that the motorbikes had them beat and quit.

The Diamond Rubber Company gave out touring note books at Ft. Wayne and extended an invitation to make headquarters at their branch in Columbus.

One rider did a polite stunt when he dismounted and held a horse driven by a lone woman until all the machines had passed near Vandalia.

When Dayton was reached many of the machines were pennant bedecked.

F. A. M. arm bands were distributed by Tourmaster Campbell at Lima.

Frank Roman, on a White twin Thor, evidently a new rider of country roads, went down and out on a sharp turn. He collided with a fence post and was unconscious for a few minutes.

At Sidney the boys had tubs of soft drinks and met a jolly good bunch of motorcyclists. Many expressed the wish that they could join in.

At South Bend one rider got the fever and got an extra tire, filled up and joined without previous intent.

The Piqua (O.) M. C. dished out sandwiches of all kinds, and they were welcome.

S. E. Davis, of Ft. Wayne, was the only Henderson rider on the run. His machine attracted no little attention, and he was busy answering questions.

One farmer at a railroad crossing, who had from all appearances been on duty there all his life, said: "I never seed so many of those pesky motorsickles in all my life. There must be fully 500, ain't there?"

A. F. Mercer, of Weston, O., mounted a 7 M. M. machine entirely nickel-plated, but his hopes were dimmed when his front fork was snapped entirely off at the square in Springfield.

H. L. Gebbert, of Bowling Green, rode the smallest machine on the tour, a Yale 3½ h.

Purdy and Wickwire, of Chicago, left on Tuesday and made Springfield in the evening of the same day. Some going. They rode seven Indians.

President Hamilton, Chairman Thornley, Fred Willis and others met the boys outside of Columbus in an automobile.

P. B. Whitney met the boys out of Columbus in a side-car with Bill Tuebner. He took photos with his Graflex at high speed.

Bill Tassell rode so fast from Springfield that he blew his collar off. At least that is the way he tells it.

The boys stopped abruptly at Columbus while cleaning their machines when a milk wagon went by. The milk man sold out.

Mrs. Helen White, of Indianapolis, who rode to Columbus on her Pope, which she purchased especially for that purpose, got a late start at Indianapolis. She waited for Roscoe Neptune, of Columbus, Ind., who had engine trouble. Finally Neptune got started and all went well for a while. However, soon after the two tourists left Cambridge City, Neptune got stuck again, and Mrs. White got a rope and towed him forty miles until they reached Richmond, Ind. At that point Neptune decided he had better drop out, and Mrs. White went on. She stopped at Dayton over night, although she was due at Springfield. She arrived at the latter place with the Chicago tourists the next morning, and rode into Columbus with the combined tour.

Harry Graff, president of the Indiana Motorcycle Club, and George Stone, one of Indianapolis's four motorcycle policemen, made

the trip to Columbus in an automobile, and arrived in the city from Indianapolis in one day's riding. They passed the tourists at Dayton and lunched with them there.

The tourmasters were easily distinguished by their purple and gold sweaters, and the little skull caps of the same color. The lieutenants wore only the caps, which were furnished by the F. A. M. and distributed by the tourmasters.

All the riders obeyed the whistles of the tourmasters. The whistles were very shrill, and could easily be heard above all the noise that the machines made.

The riders didn't mind the sun much. Most of them wore handkerchiefs around their foreheads or large straw hats, or caps with large peaks.

There were three women from Springfield, Ohio, who rode to Columbus on tandems. They were Miss Louise Lyons, Mrs. L. Belt and Mrs. M. G. Grove.

Tourmaster Baker ran over a snake five feet long down in Brown county and killed it. At least that is Baker's story, and Baker ought to know.

Tourists in southern Indiana came to a halt near Bedford, when they saw a girl riding

Edward Buffum and Indian Riders at Columbus. Paul Derkum in the Center.

They Were Lined Up Inside the New Half-Mile Board Track After One of the Championship Meets.

a horse bareback at a fast gait along the road.

At Bedford the tourists stopped to inspect the great stone quarries, which make that town famous.

Tourists on the Baltimore tour were fooled a number of times when they talked to C. E. Parker, of Dunbar, Pa., who is the "double" of Dr. Gibson. More than a dozen men mistook the man from Dunbar for the man from Westboro.

The Kokomo Tire Company gave a new set of tires to each one of the eight Kokomo riders who joined the tour.

Thurman Constable, of Union City, who broke into the limelight last year when he defeated E. G. Baker in a match race of five miles, joined the southwest tour at Richmond, Ind. He was accompanied by F. M. Turner, of Union City, who also rides in amateur events.

The Cincinnati riders, who joined the southwest tour at Dayton, left home at 9 o'clock in the morning, and it took them just 2 hours and 15 minutes to make the 65 miles to Dayton.

William J. Powers, of Indianapolis, a live wire in the Indiana Motorcycle Club, made the trip to Columbus in an automobile. John Kinney, of Indianapolis, also rode to Columbus in a motor car, to be on hand as timer at the races.

George Altnordhoff and Albert Zettle, of Cincinnati, after attending the convention and race meet, started out for Portland, Me. They will travel all over the East, stopping in practically all of the large cities, including New York, Philadelphia, Buffalo, Boston and Cleveland.

Frank Libbey Valiant, of Middletown, who was to join the southwest tour at Indianapolis, was unable to get away with his side-car in time, as he was "tied up" at the Merkel factory. However, he made the trip to Columbus with his wife on Wednesday.

Charles Henderson, president of the Springfield (O.) Motorcycle Club, was on hand to welcome the tourists Tuesday night, and made all arrangements for taking care of the riders' machines for the night. The Springfield club saw that the tourists' motorcycles were garaged free of charge.

The Federal Tire Company made a ten strike when it employed Miss Mary O'Donnell, of Columbus, to pin Federal Tire pennants upon the fellows' coats. The motorcyclists were not satisfied with just one pennant in most cases, and often applied for others. Besides giving away pennants the Federal Tire Company gave to each F. A. M. member a good clothes brush, which came in handy.

The Goodyear Tire Company distributed pretty white parasols, which proved very popular with the ladies.

The Diamond Rubber Company furnished cigars, loose tobacco, and corn-cob pipes at the smoker. They also gave away rubber drinking cups at the convention.

The Goodyear Tire Company had tire cars on the northwest and southeast tours, and they rendered valuable service.

The Reading-Standard Company distributed mirrors and buttons at Columbus.

O. F. McLain, of Indianapolis, who joined the tour there, has a wooden leg extending up well above his knee. However, McLain can ride a motorcycle as well as many riders, and is in the habit of taking long journeys every week.

The Four States Tour—a body of forty Indiana-made automobiles—which is making a 1,600-mile journey, stopped in Columbus July 17 and 18. They arrived in the city about the same time as the motorcyclists from the East, and helped to pull in some machines which were stalled. The wrecked machine belonging to Mr. Leuer, of Buffalo, was picked up by a Four States Tour automobile and carried into Columbus.

The White Thor pennants were very much in evidence at the convention.

The tourists had a hard time to get rooms at the Virginia, the official hotel. Some riders ordered rooms two weeks in advance, but were not accommodated.

Jack Prince and Doc Thornley distinguished themselves at Columbus by wearing white shoes.

The United States Tire Company furnished each tourist a neat F. A. M. watch fob, well worth wearing.

Jack Prince told certain motorcyclists that he is going back to Indianapolis within ten days and is going to build a board track there. "We will have a track there before the snow flies," said Prince.

Eph. Ball, the only F. A. M. delegate from Virginia, made the trip by train, as there were no tourists leaving his part of the country.

BUSINESS AND PLEASURE.

H. H. ADAMS, a wholesale hay merchant at Coffeyville, Kan., has become so enthused over the motorcycle that he has sold his single-cylinder Merkel and has purchased a twin machine with side-car. Adams makes long trips into the country almost every day on his quests for hay, and usually carries a passenger.

Falor (Extreme Right) and the "Goodyear Team."

THE REPORT OF THE RETIRING PRESIDENT

Hamilton's Recommendations—Secretary-Treasurer Gibson's Reports Show that the F. A. M. Has Made Wonderful Progress in the Past Twelve Months—Mayor Karb, of Columbus, Welcomes Delegates.

Retiring
President
Hamilton.

THE 1912 Assembly of the F. A. M. was called to order in the Virginia Hotel in Columbus Thursday morning at 10 o'clock. President Hamilton introduced Mayor Karb, of Columbus, who said that the convention reminded him of one he had addressed three weeks ago, because it was so different. He told how he had made an enthusiastic speech, which was very feebly applauded, to an assembly of deaf mutes. His Honor stated that he could not help notice the great strides the F. A. M. has made in recent years; that he was heartily in favor of the F. A. M. reforms in regard to open mufflers, tank-riding and speeding; that he thought Columbus had a great motordrome, and he wished the Federation a successful race meet. The Mayor also boosted Columbus, as all mayors boost their home towns, and told the delegates of the interesting things in the city they should see. He finished by turning the town over to the F. A. M., saying, "If any of you boys get into trouble, come see me."

The minutes of last year's meeting were read by Secretary Gibson and adopted. President Hamilton then made his address and, after dwelling upon the progress of the organization, recommended strict legislation against the open mufflers, tank-riding and speeding. He also favored the elimination of the district system. His report and recommendations follow:

When I was elected President of the F. A. M. at Buffalo in July, 1911, the affairs of the organization were in excellent condition, due to the able administration of your former President, Mr. F. I. Willis, and the officers associated with him. The benefit to the organization in a continuing Board of Directors shows for itself in the results accomplished this past year, and I cannot impress upon you too strongly how deeply indebted the F. A. M. should be to the officers who had the foresight to revise our Constitution and By-Laws so as to provide, for the incoming administration, the support of officers who knew from experience what work should be carried on for the benefit of our members.

The Federation of American Motorcyclists was organized the 7th of September, 1903, with 42 charter members. From 1903 to 1909 the membership had

increased to only 2,500. However, the growth of the F. A. M. from 1909 has been remarkable, and it is very gratifying to note that each year we are making steady gains. Our numerical membership July 1 last year was 9,664 as against 16,250 on July 1 of this year, showing a gain of 6,586, or over 68 per cent. Our fully paid-up membership July 1 this year shows an increase of over 63 per cent. as against the same date last year. On July 1, 1911, there were 168 clubs affiliated with the F. A. M. On July 1 this year, 291—a gain of 123, or 70 per cent. On July 1, 1911, we had 313 registered repair shops, and this year we have 678—a gain of 365, or 116 per cent.

Our organization was never in a better condition financially than it is today. Our total receipts for the fiscal year ending July 1 are 50 per cent. in excess of the previous year, whereas our expenses show an increase over the previous year of only 32 per cent. Our assets, consisting of cash and office fixtures, show an increase of 100 per cent. These figures prove conclusively that maximum results have been obtained at a minimum expense and, what is even more gratifying, that we are rapidly reaching the goal for which we are all striving—sufficient funds to give our members more for their dollar.

The splendid showing made this year is not due to the efforts of any one individual, but to the co-operation of all of the officers and many of the members. It is to be regretted that every member has not felt it his duty to get at least one new member each year and by so doing increase the benefits to himself and to motorcyclists in general. I desire to express my appreciation of the support given me by the Officers, the Board of Directors, the Chairmen of the Committees and by individual members, for I realize that our success is due to their co-operation.

Very few of our members realize the vast amount of work that passes through the hands of Dr. G. B. Gibson, our Secretary and Treasurer. It has taken him several years to perfect a system that enables him to properly look after the increasing work of his office, but he is now master of the situation and his report will show how well he is looking after your interests.

When considering the increase in our membership all of you should feel deeply indebted to E. M. Estabrook—that grand old man who has so ably served as Chairman of the Membership Committee. To Mr. Estabrook, more than any other one man, is due credit for the growth of our membership.

REPORT OF SECRETARY-TREASURER GIBSON.

Your Treasurer takes pleasure in submitting to you his Annual Report for the 1911-1912 fiscal year ending June 30, 1912. As this report is the healthiest that it has been my pleasure to read during my nine years of looking after the money of this organization, it is very gratifying to tell you of the excellent financial foundation upon which we stand at the present time.

Receipts.	
Balance from last year	\$1,135.28
Affiliated members joined during year	5,288.00
Unaffiliated members	3,020.00
Members renewing during the year	2,093.00
F. A. M. novelties and miscell. receipts under 50 cents	765.71
Repair shop signs sold (349)	698.00
B. A. Swenson, eastern Buffalo tour entries	82.45
P. B. Whitney, western Buffalo tour entries	85.00
J. P. Thornley, Competition Comm., excess over \$200	2,297.89
Dividend Westboro Savings Bank	10.00
E. L. Moore, rebate of Pacific District funds	17.75
A. W. Green, rebate of Pacific District funds	78.00
Motorcycle Manufacturers' Association, gift to legal fund	60.00
C. F. Gates, fines collected at Los Angeles track	10.00
Eastern Motor Racing Association, Exclusive franchise	250.00
Riverview Exposition Company, exclusive franchise	750.00
Point Breeze Track Company, exclusive franchise	750.00
J. A. McGrath, rebate on pennants	10.00
Total receipts for the fiscal year	\$17,401.08

Expenses.	
G. B. Gibson, Sec.-Treas., salary and mdse. (\$1,020-\$3.50)	\$1,023.50
M. T. Gibson, Asst. Sec., salary and mdse (\$310-\$3.50)	513.50
F. I. Willis, expenses Buffalo trip	42.00
J. P. Thornley, expenses Buffalo trip	42.50
G. B. Gibson and Mrs. Gibson, expenses Buffalo trip	69.00
J. P. Thornley, Comp. Comm., salary allowance	715.00
J. P. Thornley, Comp. Comm. stenographers	715.00
E. M. Estabrook, Mem. Comm., salary allowance	747.50
Miss A. M. Bergh, Sec.-Treas. office stenographer, salary	162.50
Miss L. D. Barnes, Sec.-Treas. office stenographer, salary	109.50
Miss R. A. Harrington, Sec.-Treas. office stenographer, salary	44.57
Harold Young, Sec.-Treas. office boy, salary	45.50
Postage, Sec.-Treas. office for the year	610.50
Express and freight, Sec.-Treas. office for the year	48.34
N. S. Sibley, clerical work for Sec.-Treas.	68.00
H. W. Moses, carpentering Sec.-Treas. office	14.25
E. J. Aldrich, mailing envelopes for Sec.-Treas.	2.50
R. B. Robinson, mailing envelopes for Sec.-Treas.	2.50
Edgar Adams, mailing envelopes for Sec.-Treas.	2.50
Westboro Post Office, Sec.-Treas. box rent and stamped envelopes	333.72
Westboro Electric Co., Sec.-Treas. electric light	9.30
F. W. DeVolf, freight and carting for Sec.-Treas.	30.61
J. W. Fairbanks, bond for Sec.-Treas. and office fire insurance	25.75
B. C. Hathaway, Sec.-Treas. office rent	132.00
G. H. Hamilton, President's office expense	40.88
F. I. Willis, President's office expense, 1910-1911 fiscal year	83.34
E. M. Estabrook, Chairman Mem. Comm., office expense	958.37
Whitehead & Hoag, membership pins	1,612.38
Chronotype Printing Co., Sec.-Treas. office printing	2,131.96
Iroquois Hotel, Buffalo office while at 1911 meet	23.90
Bangor Co-Operative Printing Co., Mem. Comm., printing	899.75
Ingram Richardson Co., repair shop signs	785.22
Meyer Cord Co., transfers (\$25 reward)	107.80
Westboro National Bank, protested checks	12.25
E. E. Vreeland, printing competition rules	150.00
B. A. Swenson, deficit 1911 Buffalo tour	26.95
J. Leo Sauer, expenses Toronto trip	41.35
J. S. Gates, office mdse. for Sec.-Treas.	56.00
A. K. Gammon, office furniture and mdse. for Sec.-Treas.	189.19
Dieges & Clust, solid gold F. A. M. pins	111.38
J. A. McGrath, Columbus meet pennants	70.20
C. T. Terry, legal services for Legal Action Comm.	250.00
L. F. Fales, 3 Oliver typewriters and mdse.	272.85
J. W. Peck, Oliver typewriter	67.50
Nick B. Harris, detective agency, stolen machine reward	25.00
C. F. Chapman, Deputy Sheriff, stolen machine reward	25.00
L. R. Abbott, wiring Sec.-Treas. office	14.25
Office Equipment Co., typewriter desk	17.00
Oliver Typewriter Co., mdse.	8.04
Spies Bros., Lake District medals	70.00
Walker Lithograph Co., U. S. wall map for Sec.-Treas.	2.00
H. F. Chamberlain, mdse. for Sec.-Treas. office	45.50
W. W. Bender, legal services for J. P. Thornley	25.00
G. W. Johnson, Sec. Lynn (Mass.) Motorcycle Club rebate	11.00
Wautoma Implement Co., rebate on repair shop sign	2.00
A. C. Banter, San Jose, Cal., stolen machine reward	25.00
Hampshire Art Press, printing for Old Eastern District	32.00
F. S. Morse, Sec. old Eastern District expense	23.10
Century Catalogue Co., drawings for certificates	45.00
H. Lieber Co., framing resolutions	2.50
W. H. H. Chamberlain, ledger for Sec.-Treas.	1.30
C. E. Beech, mdse. for Sec.-Treas.	.75
C. M. Morse & Son, mdse. for Sec.-Treas.	2.00
T. J. Sixsmith, old Transportation & Facilities Comm., postage	1.00
E. L. Buffington, 1911 Transportation and Facilities Comm., expense	7.25
P. B. Whitney, Vice-Pres. expense, postage and miscell.	36.65
B. J. Patterson, Vice-Pres. expense, postage and miscell.	26.66
J. D. Miller, Vice-Pres. expense, postage and miscell.	7.50
John Rogan, printing for Vice-Pres. La Salle	2.00
S. C. Shackelford, mdse. for Vice-Pres. La Salle	.75
Bridges Mfg. Co., stationery for Vice-Pres. La Salle	4.16
Scranton-Whetmore Co., Vice-Pres. La Salle	73.48
F. S. Betz Co., desk for Vice-Pres. Patterson	20.50
Remington Typewriter Co., typewriter and mdse. Vice-Pres. La Salle	32.25

M. M. Huyett, Central District Sec. postage	1.94
Total Expenses	\$14,077.07

Probably no man connected with our organization has done more work and received more criticism than Dr. J. P. Thornley, Chairman of the Competition Committee. The Doctor's position is not an enviable one, and the very fact that he has been criticised is the best proof that he has been fearless and conscientious in administering the affairs of his office. Racing has grown very rapidly in this country the past year and a great deal of credit is due Dr. Thornley for the manner in which he has conducted his office.

The Press Committee, of which Fred I. Willis is chairman, has been a very important factor in the growth of the F. A. M. Every manufacturer, every large business and every organization realizes the necessity of publicity. Very few of our members know that the little stories about motorcycling which they read in their daily paper are sent out by our Press Committee. It has been the object of this committee to educate the public through the daily press to the benefits of motorcycling and acquaint it with the work being done by the F. A. M.

The Federation of American Motorcyclists is not a money-making organization. Every dollar is spent in promoting motorcycling and protecting the rights of motorcyclists. Your Directors, including your President, do not draw any salary, and their offices are conducted without any expense to the organization other than stationery and postage. The appropriations made for the Secretary-Treasurer, the Chairman of the Competition Committee and the Chairman of the Membership Committee are very small when compared with the amount of work done by these officials.

The organization has now grown to such an extent that the work in connection with the different offices is burdensome. It is not fair to the gentlemen who have devoted their time in building up the organization to expect them to continue their work without suitable remuneration, while it is not fair to the organization to appoint men to the various offices who haven't the time to devote to them.

It would be an easy matter to establish a central office where all the detail work of the various committees could be looked after, and I would recommend that your Secretary and Treasurer be put in charge and be given an appropriation sufficiently large to enable him to see that the work is taken care of by efficient employees. The plan I have suggested provides a more economical way to handle the work than where appropriations are made for each office. By concentrating the work more can be accomplished at less expense.

Your President and Board of Directors should serve without any remuneration. Having a central office, their duties would not be arduous and they would, in fact, be serving simply in an executive and advisory capacity. They could outline the policies of the organization and let the central office carry out the details of the work.

I am heartily in favor of the amendments to our Constitution and By-Laws providing for the elimination of the districts and the appointment of State Commissioners. The rapid growth of the organization necessitates this change. The State, and not a district comprising several States, should be the unit of government. The State Commissioners should report to the National Secretary, and these reports should be tabulated and the Chairman of the Committee advised of any important matters that should receive their attention.

The racing rules will be revised within the next thirty days. Although criticised for not passing upon the rules drafted by the committee appointed for that purpose last year, I wish to explain to this body that I did not believe that five or twelve members had the right to determine the classification of riders. This point will be passed upon by the National Assembly, while the details of the rules will be worked out by a committee.

The F. A. M. has for the past year conducted an educational campaign through the daily press and trade papers in an effort to correct certain abuses practiced by some of the riders. The object of this campaign has been two-fold: First, to acquaint the rider with the injury he is doing himself and fellow-motorcyclists, and, secondly, to let the public know that the F. A. M. is not in sympathy and does not countenance these abuses. I refer particularly to the "Open Muffler Fiend," "Tank Riding" and "Speeding." Every member should constitute himself a committee of one to see that these abuses are corrected. You cannot show your loyalty to the F. A. M. and the principles it represents in any better way. I want to see a resolution passed by this assembly putting the F. A. M. on record as being opposed to these abuses, which only place motorcycling and the motorcyclist in bad repute with the public, and as favoring any legislation that will eliminate these evils.

The F. A. M. is in position to do a great deal of good for motorcycling and the motorcyclist, but whether its power increases or decreases will depend upon the loyalty of the individual members. What we need are not only members, but members who are Boosters. Boost the F. A. M. and you boost your own individual interests. The payment of your dues is only a small part of your duty to the organization. Take an active interest in your fellow motorcyclists, encourage touring, see that all sports pertaining to motorcycling are kept clean, and above all do not overlook the rights of others.

The fiscal year ending July 1, 1912, has been a prosperous one for the Federation of American Motorcyclists, and it affords me a great deal of pleasure to be able to retire as your President with the conviction that the F. A. M. will each succeeding year have a larger membership and greater power. I desire to extend my personal thanks to the officers, the committees and the members, as well as to the public press and trade papers for the support they have given my administration. Although I will not serve

The Real Test Of Tires

The real test of tires is not on the race-track—it is made on the open road where average conditions prevail.

Track and road conditions are entirely different. Tires that are built for speed and speed alone will not stand up under the gurell-

ing grind of the rough and rock-strewn road.

They are designed to be used under ideal conditions—conditions that will not be found even on our finest boulevards! When subjected to the real test they will not stand up.

They can't—they are not built for it.

The Tire Built For Road Results

Diamond Motorcycle tires are built for road results—greatest mileage. Our engineers have analyzed every road condition. Every stress and strain to which a tire is subjected has been met.

Diamond Engineers have at their command all the knowledge gained in 14 years of tire building and rubber compounding. They are the most efficient corp in the world.

It was they who designed and built the first pneumatic tire made in America for motor driven vehicles. That they built well is attested by the fact that today these tires are the largest selling single brand of tires in the world!

But it has not been these men alone—not the knowledge gained by the few—that has made Diamond tires supreme. Ten thousand actual users have loaned their

knowledge. Every problem they encountered they told us of and offered a solution.

With this vast store of facts gathered from every section of the country during a period of 14 years, at their command, our engineers designed Diamond Motorcycle tires.

Endurance was not sacrificed for resiliency, or either for speed. The maximum of each was their aim.

For endurance—ability to stand up and deliver the mileage under the severest conditions—these tires have no equal. Ask for them. Insist on having them. They cost no more than weaker tires.

Made in two treads, studded and corrugated—but only one quality. In single clinch only and all sizes to fit the 26 inch and 28 inch rims, including the 29" x 3".

Send For Our Motorcycle Book. It's Worth Having

*We could build them cheaper—But we won't
We would build them better—But we can't*

The F. A. M.
Meet in
Columbus.

It may be argued that the trade papers could not do otherwise than claim, for each F. A. M. Annual Race Meet and National Assembly, features superior and generally more attractive than those of any preceding occasion of a similar character. But we are not under the necessity of *claiming* big things for the Columbus Meet, as last week's events in the way of business sessions, entertainment and even the races, which were not as successful as they should have been, speak for themselves. As it was, the racing was on a more satisfactory plane than in previous years, while for the failure to make the board track events entirely successful, the officials in charge can hardly be held responsible. As in previous F. A. M. race meets, there was not a sufficient number of entries, and the machines entered were almost entirely of one make, so that there was not the competition necessary to make the meet a very enjoyable one from a standpoint of good sport. No apologies need be offered, at any event, for the interest shown in the business affairs of the organization and the large and enthusiastic attendance of delegates at the different sessions of the National Assembly. The meetings were ably conducted by President Hamilton, and something like one hundred delegates, representing riders in all parts of the country, took an active and intelligent part in selecting their national officials and in deciding important points involving, among other things, amendments to the Constitution and By-Laws, and changes in the rules for competition. Business was transacted with dispatch and, under the leadership of the genial chairman, there was not a single hitch in the entire proceedings. It was largely because of this most satisfactory condition of affairs that the Assembly voted down a constitutional amendment providing for holding the business sessions in the winter in connection with the shows. In the face of what had been accomplished by this year's Assembly, there remained no argument in favor of the change, which undoubtedly would have been approved if the suggestion had been made at Buffalo last year, where one of the business sessions was convened at one o'clock in the morning. If all the national meets are as well attended by interested delegates as was the one at Columbus, there will be no occasion for revising the present plan of summer sessions.

The New
President.

In the election of Dr. B. J. Patterson, the Federation of American Motorcyclists has chosen an energetic, conscientious official. He is enthusiastic in every sense of the word and it is certain that he will do all in his power to double the present already large membership of the organization. President-Elect Patterson, who has served capably as vice-president of the Central District, and who is known throughout the motorcycle world as the promoter of the famous Short Grass Tour, will be assisted in the management of affairs of the organization by such experienced men as Secretary-Treasurer Gibson, who was unanimously re-elected; by Chairmen Thornley and Estabrook, both of whose appointments are assured, and by a board of directors which is fully qualified to render all the assistance the new president may require.

A BUSY COLUMBUSITE.

LEO P. BIRKENBACH was one of the most consistent rooters for Columbus during the campaign to land the F. A. M. convention and as a member of the general committee in charge of plans to entertain the visitors he established an endurance record for geniality and activity. The photograph shows him in one of his rare moments of repose.

F. A. M.
Touring
Bureau.

The convention voted unanimously in favor of a number of important amendments to the Constitution and By-Laws, among them proposals for the elimination of the district system and for placing full responsibility in each State upon the shoulders of a State commissioner. The organization will also establish a touring bureau to take the place of the hitherto inactive touring committees. It will require time to bring this bureau into working order, but while the task is undoubtedly a tedious one, it will be by no means difficult to gather, with the assistance of fifteen thousand members, valuable touring information from all parts of the country. The writer, as publisher of MOTORCYCLE ILLUSTRATED, has had a little experience in conducting a touring department and will be only too willing to co-operate with the Federation in order to help make this important feature of its work successful from the start.

Amateurs
and
Professionals.

The convention adopted unanimously the new classification of competitors proposed by Dr. Thornley, chairman of the Competition Committee. The fact that there was absolutely no opposition to Dr. Thornley's change in the competition rules may be regarded as evidence that the so-called trade rider has come into disrepute in all parts of the country, and that there is an urgent demand for his elimination from the sport. As a result of the adoption of the new classification, there will be only two classes of motorcycle racers, professional and amateur respectively. A professional is defined in the new rules as a rider who has competed for cash, or who, being directly or indirectly connected with the trade or operates motorcycles as a trade or profession, competes on a track, where the public is charged admission. Of course the fact that a man is connected with the trade does not of itself make him a professional. In order to become such he must either ride for cash or, being a trade man, race in competition on a track to which admission has been charged the spectators.

THAT CLEVELAND CONTRACT

Case Involving Kreamer and Earle Armstrong Is Aired Before the F. A. M. Convention Delegates.

THE much talked of Kreamer-Armstrong tangle, which resulted from the signing of a "hippodrome" contract at the Cleveland Motordrome, was given a thorough airing before the convention delegates at the Friday afternoon session. Chairman Thornley, of the Federation competition committee, stated the circumstances as they had been brought to his attention and Kreamer in turn put in a defense. Chairman Thornley referred to a copy of the contract which had been forwarded to him. It had been signed by Kreamer and Armstrong, the former presumably representing the track management, and stipulated that the Excelsior rider should not win any race on the Cleveland track by more than a machine length. Armstrong soon realized that he had made a mistake and opened up his machine in one of the events so that he won by a lap. The management took him to task for not living up to the "hippodrome" contract, an argument followed and Armstrong forwarded a full statement of the situation to the Excelsior factory. The Excelsior folks in turn placed the data in the hands of Chairman Thornley.

In presenting his defense Kreamer stated that he is innocent and contended that the chairman of the competition committee has been "persecuting" him for some time past in an effort to shut him out of the motorcycle racing game. Kreamer also stated that he was not the framer of the objectionable contract; that M. F. Bramley, the track manager, had prepared it and that when the time arrived to sign it Bramley instructed him (Kreamer) to sign it and then walked away. Kreamer explained that he did not regard the contract seriously and that in affixing his name to it he simply did so in the belief that it was too small a matter for Bramley to bother about. Kreamer testified that he was not connected with the Cleveland Motordrome officially and that he signed the contract because he had been ordered to do so by Bramley.

Chairman Thornley had no mercy on the race promoter, however. He raked Kreamer fore and aft with queries as to the management of the Cleveland track and other tracks with which he has been identified, and contended that the accused promoter should be dropped from the F. A. M. He summed up by charging Kreamer with entering into the "hippodrome" contract with Armstrong, owing money to several racers who rode for him at Los Angeles and defying the F. A. M. The disposition of the Cleveland Motordrome case was left with the Competition committee.

A CHECK FOR LORING.

WE have a check for Warren L. Loring in payment for luggage carrier design. A letter addressed to him at Bristol, Conn., was recently returned by the post office. If Mr. Loring will send us his present address, check will be forwarded at once.

THE Coffeyville (Kan.) Motorcycle Club has adopted the colors of the F. A. M. and has ordered pennants to read "C. M. C. 288."

READY FOR CYCLE PARTS CONVENTION

Committee Puts Finishing Touches on Fine Program for Detroit Sessions—Big Attendance Is Assured, Says Surre.

WITH plans practically complete for the second annual convention of the Cycle Parts Industries, to be held in Detroit August 6-9, there is every indication that the program will improve upon last year's excellent showing, from a business as well as a social viewpoint. Chairman W. J. Surre, of the general committee of arrangements, has set his usual lively pace in mapping out the three-day schedule and he is authority for the statement that those who attend will be given no opportunity to become "homesick." The official program is announced as follows:

TUESDAY, AUGUST 6.

Immediately upon arrival, the visitor is requested to register at the headquarters, which will be Parlor "E," located on the first floor of the Cadillac Hotel. There he will receive the official badge, and also tickets for the various entertainments planned during the week.

1 p. m.—Daylight sail on Lake St. Clair and the Detroit river on the steamer *Sappho*, chartered for the exclusive use of the party for the afternoon. This sail will give an opportunity of viewing both the American and Canadian sides of the lake and river.

8:30 p. m.—Theater party at the Temple theater. The management advises that they will have a very high-class vaudeville bill.

WEDNESDAY, AUGUST 7.

10 a. m.—Meeting of the Motorcycle Manufacturers Association; also meetings of the bowling and sight-seeing committees.

2:30 p. m.—Informal reception under the direction of the ladies' entertainment committee.

8 p. m.—Bowling contest at the Ponchartrain Bowling Alleys, which are located on Cadillac square, directly opposite the Ponchartrain Hotel. The committee has leased the eight alleys for the entire evening.

Two of the alleys will be reserved for the use of the ladies on this occasion.

THURSDAY, AUGUST 8.

10:30 a. m.—Meeting of the Cycle Parts and Accessories Association. Informal meeting of the jobbers.

3 p. m.—Visits to the various automobile factories under the direction of the sight-seeing committee.

FRIDAY, AUGUST 9.

10:30 a. m.—Joint meeting of the Cycle Parts and Accessories Association, Jobbers and Bicycle and Motorcycle Manufacturers.

3 p. m.—Seeing Detroit by auto.

The committee has arranged with one of the companies operating sight-seeing autos for a two-hour ride around the principal points of interest in Detroit, and also around Belle Isle, one of the principal pleasure resorts near Detroit.

As has been previously explained the official headquarters will be at the Hotel Cadillac, but Chairman Surre suggests that those who are unable to obtain accommodations there may be cared for satisfactorily at the Hotel Griswold or the Ponchartrain hotel, both located within easy reach of the Cadillac. The committee has had many replies from jobbers in all parts of the country to the effect that they will attend the convention, and it is worthy of note that

quite a few of them will be participating in the program for the first time.

The committees which have been at work for some time past on the arrangements are made up as follows:

Committee of Arrangements: W. J. Surre, chairman, Continental Rubber Works; D. B. Smith, Standard Co.; L. M. Wainwright, Diamond Chain & Mfg. Co.

Reception Committee: R. D. Webster, chairman, Eclipse Machine Co.; H. F. Mesinger, H. & F. Mesinger Co.; W. E. Eccles, Persons Mfg. Co.; W. C. Schweinert, Schrader & Sons; F. L. Waters, Chicago Handle Bar Co.; S. A. Falor, Goodyear Tire & Rubber Co.; Louis Schwab, Stevens & Co.; DeWitt Page, New Departure Mfg. Co.; A. C. Maternach, Standard Welding Co.; J. F. Cox, Pope Mfg. Co.

Bowling Committee: T. R. Palmer, chairman, Continental Rubber Works; Jos. F. Merkle, Miami Cycle & Mfg. Co.; M. C. Stokes, U. S. Tire Co.; John Brandt, Troxel Mfg. Co.; W. G. Schack, Emblem Mfg. Co.; E. C. Bowman, Corbin Screw Corp.

Sight-Seeing Committee: F. H. Harris, chairman, Diamond Rubber Co.; H. C. Tottman, Whitney Mfg. Co.; Thos. Heller, Atlas Ball Co.; W. Watterscheiet, A. R. Mosler & Co.

Ladies' Entertainment Committee: Mrs. F. I. Willis, Mrs. Keyser Fry, Mrs. W. J. Surre.

Press Committee: J. Leo Sauer, chairman, MOTORCYCLE ILLUSTRATED; W. D. Callender, *Motorcycling*; A. Eugene Bolles, *Bicycling World & Motorcycle Review*; W. A. Wahlgreen, *Motor Field & Cycling West*.

RODE FROM OREGON.

J. P. SCHANTIN, 41 Grand avenue, Oregon, is the F. A. M. member who toured the longest distance on his machine to the Columbus F. A. M. meet. He left his home town May 28, going south to San Diego, Calif., thence through Yuma and Phoenix, Ariz., to El Paso, Texas. He crossed the International Bridge and made a brief stop in Juarez, Mexico; thence north to Dodge City, Kansas, east through St. Louis and Indianapolis to the Convention City, Columbus, arriving Friday afternoon, July 19. Secretary-treasurer Gibson had the pleasure of a personal interview with Schantin and was much interested in perusing the F. A. M. log book which he used on his journey. He has a very complete collection of United States Postoffice post marks of the various towns and cities through which he toured. Mr. Schantin intends to continue his vacation tour east to New York City, and will return on his machine via Buffalo, Chicago and Milwaukee, intending to take the train there for his home. Schantin's machine is a Flying Merkel, 7-h. belt drive. Since leaving home, he has ridden 5,420 miles.

GEER WAS NABBED.

E. D. GEER is one of the unfortunates to fall into the speed trap set by the Cleveland chief of police. He got out by paying a fine of \$25 and upon his promise to sell his machine. These traps are being set about the city in numerous places.

ABOLISH TRADE RIDER CLASS

Beginning October First, There Will Be Only Two Classes of Competitors, Amateurs and Professionals—Chairman Thornley's Report.

NO sympathy was shown the so-called "trade rider" by the delegates to the Columbus F. A. M. National Assembly. With a unanimity that was quite remarkable the convention adopted Dr. Thornley's competition rules amendments providing for only two classes of competitors—professionals and amateurs. The new classification with numerous less important changes in the competition rules, becomes effective October 1, when, if not before, practically all of the present-day trade riders will become professionals. In the revised competition rules the three sections of Article 4 will read as follows:

"Section 1. Two classes of competitors shall be recognized—amateur and professional.

"Section 2. An amateur is one who has never received, directly or indirectly, since 1906 any compensation whatever for engaging in motorcycle competition or exhibitions, who has never knowingly competed in any sport against a professional or who has never sold or otherwise realized pecuniary benefit from a prize. Upon request of the chairman of the competition committee, or the referee of a contest, he shall furnish satisfactory sworn proof of his standing as an amateur.

"Section 3. A professional is one who has competed for cash, or who, since the adoption of these rules, and being connected either directly or indirectly with a person or firm that manufactures, assembles, sells or repairs motorcycles, motor vehicles or internal combustion engines, or operating them as a trade or profession, competes on tracks where the public is charged admission, or who has otherwise failed to observe the rules applied to an amateur."

Dr. Thornley was so pleased with the manner in which the delegates adopted his amendments that, several good objections having been advanced, he withdrew an amendment, the purpose of which was to confine amateurs to racing outside a certain radius of their homes. The sub-committee of the special committee appointed last year to revise the rules reported, through Mr. Sauer, that the rules had been revised throughout, but that it had been impossible to get action by the entire committee. Mr. Sauer moved that the old committee be discharged and a new one of three appointed to whip the revised rules into shape at once for printing. This motion having been adopted, the chairman appointed Mr. Sauer, Dr. Thornley and John O'Connor as members of the committee.

PROPOSE ENGLISH ALLIANCE.

The question of joining hands with the English motorcycle federation, the Auto Cycle Union, of England, was discussed at the convention and met with much favor. Mr. Wells, who represented the Auto Cycle Union, suggested that the F. A. M. enter into an alliance with the British organization for their mutual benefit. The matter was placed in the hands of Dr. Thornley, of the competition committee, and the F. A. M. board of directors.

The affiliation will no doubt be brought about long before the next national convention of the F. A. M. The two most obvious

benefits which the F. A. M. would derive from the affiliation, as pointed out by Mr. Wells at the convention, would be, first, a mutual recognition of racing records, making genuine "world's records" possible, and, secondly, it would give F. A. M. members all the privileges and rights of the members of the Auto Cycle Union when touring or racing in Europe, and the members of the Auto Cycle Union would be treated in a reciprocal manner when in the United States.

Mr. Wells, in his talk before the convention, stated that the Auto Cycle Union during the past year had honored over 300 American motorcyclists with membership privileges when touring abroad. This was done without the knowledge of the F. A. M. and in recognition the assembly honored the Union with a vote of thanks.

Two important resolutions in regard to board tracks and board-track racing were adopted. The first has to do with the exclusive franchises, and the other deals with the use of the money obtained from fines placed on professional riders for violations of the rules.

In the future all money collected from pro-

fessionals in fines will be placed in a separate fund, which will be used as relief money for professional riders who are injured while racing, and the amount of money which is to be given the rider or the rider's family in time of need is to be decided by the F. A. M. board of directors. It was moved to place \$500 into this relief fund at once. The resolution establishing the relief fund, which was fathered by Chairman Thornley, also provides for the acceptance of voluntary subscriptions.

The matter of giving exclusive franchises for board tracks in any city for more than one year was favorably acted upon, and the Federation decided that an exclusive franchise may be given for a period of from one to five years, and that after the first year the annual fee shall be reduced each year, the percentage of reduction to be decided upon.

Two professionals were reinstated into the amateur class. They are Messrs. Wilson, of Los Angeles, and T. K. Hastings, of Brooklyn, N. Y.

Hastings' case was presented before the assembly by Howard French, of Baltimore, Md. Charles Fuller Gates, of Los Angeles, championed the caused of Wilson.

CHAIRMAN THORNLEY'S ANNUAL REPORT.

IT gives me great pleasure to inform you that the Competition Committee during the past year has been in a most flourishing condition from a financial standpoint. Elsewhere a report of the Auditor, who has gone over all my books, vouchers, correspondence and sanctions, and made a most thorough investigation, will, I hope, be read to you.

SYNOPSIS OF FINANCIAL REPORT.

On the 1st of July, 1911, I had a balance of four hundred and eighty-one dollars and sixty-nine cents, \$190.77 representing prize money for amateurs held in trust..... \$481.69

During the year I received—

For prizes for amateurs to be expended in the buying of suitable prizes.....	966.50
From miscellaneous sources	1,240.56
From the Treasurer	1,472.75
For sanctions	4,345.00

Making a total that came into my keeping of.....\$8,506.50

I expended—

For office supplies	\$237.95
For stenographer, heat, rent and light....	1,695.00
I refunded	93.00
I forwarded to Dr. Gibson, the Treasurer....	2,340.64

Under the head of Miscellaneous Expenditures, most of this money passing through my hands without stop

2,318.94	
I paid out on bills for suitable prizes won by amateurs out of money held for them in trust	838.47

Making a total expenditure of.....	7,524.00
Leaving a balance of.....	982.50

And in accordance with the rule of the office, on the 10th day of July I sent \$463.70 to Dr. Gibson as an excess over \$200 bank account, and \$518.80 held in trust for prizes.

SUGGESTS A SALARY.

In passing, I should like to say that the work of the Chairman of the Competition Committee is such that I do not care how much you reduce it to system, the mental strain is exceedingly great and the detail work will keep at least two stenographers busy the year round, with extra ones during the summer. It requires my constant personal attention, time and patience, and it has received the benefit of whatever ability I possess. It is not work that will run itself, and the mental work involved is exceedingly trying. I do not hesitate to say that it is work that should be well paid for. The Chairman of the Competition Committee should have a handsome salary to compensate him for the energy, time and ability he will be forced to expend upon the work to keep it up to the successful mark which it has reached today. Some of you may think that I am trying to ask for

a salary for myself if I am Chairman next year, and that is just exactly what I am doing; for whoever is Chairman of the Competition Committee next year should be well paid for his time and ability.

POPULARITY OF RACING.

Racing has increased enormously, and with the building of board tracks it will continue to increase. The establishment of a system of having formal applications for sanctions, blanks for Referee's reports and specimen entry blanks has made the issuing of sanctions on an intelligent basis very much easier and has helped promoters to start out in the right direction. The payment of the Referees by the F. A. M. has increased the efficiency of these officials several hundred per cent. As they do not get paid by us until they file their report, you can rest assured that the reports have been coming in with splendid regularity.

THE GOOD AND THE OTHERS.

"Rome was not built in a day," neither will motorcycle racing become the perfect sport it should be all at once. The Government of this country has prisons in which it can confine crooked men, and in spite of the fact that there are a lot of them out of jail who should be in. The Federation of American Motorcyclists has no jail in which it can confine its crooked sports, tin-horn gamblers and short card artists. Our most severe punishments are far too mild for some of the gentlemen these punishments should reach. Some people are even so foolish as to claim that the culprit may have fallen under my personal displeasure. I wish it distinctly understood right here that I would not dignify a man I believed to be crooked with any personal feeling one way or the other. I simply do not wish to have any transactions with him and feel that where I believe a man to be crooked I should be unfaithful to the trust that you gentlemen have placed in me by having any dealings with him whatever.

SCARCITY OF RIDERS.

Since last year a number of board tracks have been built and are now in operation. Unfortunately, in my opinion, tracks have increased in numbers faster than the riders have. Moreover, board track builders and promoters have found it difficult to obtain suitable machines for racing purposes. The inevitable result has been more or less exhibition riding.

ABOUT RUNAWAY RACES.

Another point: If, for example, a track had six events, a factory could send down a machine which would clean up in every one of these events with a runaway exhibition and then some other factory would do the same stunt at the next meet. The result would be that the track management would either have to shut down, because the public would not come, or, using the F. A. M. as a club, would

drive the track owners to the various manufacturers on their knees, begging for racing machines. The men who have expended money on board tracks would see their investment go up in the smoke of the machines advertising the manufacturer who had never spent one cent upon the building or running of the track. I leave it to you if this is a fair proposition, and if I have not been justified in trying to prevent such an injustice being perpetrated upon track owners. Aside from the justice or injustice of the thing, it is something which the F. A. M. could not continue to do indefinitely—for, if we attempted to force such runaway exhibitions upon track owners, they would very soon tell us to go to the mischief, and form an association of their own, exchange riders and machines and have a central repair shop where they could tune up stock motors to very nearly the same efficiency as the manufacturers could themselves.

RESTRICTIVE AGREEMENTS.

During the winter there seemed to be such a demand for F. A. M. protection for the heavy investment which was required to put on board tracks that the Board of Directors very wisely, decided to issue a so-called "restrictive agreement," which, in many ways, takes the place of what is known as a franchise in the sport of bicycling. This restrictive agreement, in a few words, is a contract made by the F. A. M. with the board track promoters to the effect that the F. A. M. will not grant a sanction within a radius of 25 miles to any other board track than the one with which this agreement is made. The track management on their part agree to run all motorcycle races under the sanction and in accordance with the rules of the F. A. M., and further agree to pay certain sums of money proportionate to the population of the town or city in which or near which the track may be located.

As this was something of an experiment, the Board of Directors decided not to enter into any contract with any track at that time for a longer period than a year, believing that so important a matter as entering into a contract of this nature for a longer period should be left to the decision of you gentlemen. Three of the new board tracks snapped at this agreement at once, the Chicago track and the Philadelphia track paying \$1,500, or \$750 each, and the Newark track paying \$250—in all, \$1,750.

It is understood that the Chairman of the Competition Committee should be only the collecting agent for these fees and that the money should not remain in his hands after the final agreement is signed. This was done at my request, as I was exceedingly anxious to have this money go into the national treasury direct and not figure as any part of my receipts.

As soon as the contracts were finally signed by the track owners this money was promptly turned over to Dr. Gibson; of this amount \$750 only figures in my books, because Mr. Johnson sent a check for \$1,000, \$250 of which was to be delivered to Wolters for his special prize, and as the check was made payable to me personally, it had to go through my books, but only figures in miscellaneous receipts and expenditures. Therefore, I believe that in justice to this department that \$1,750 should be considered part of the contribution of the Competition Committee towards the National Treasury. As I have turned over to Dr. Gibson in addition some \$900, this would mean that the Competition Committee has contributed to the National Treasury nearly \$3,000 over and above expenses.

LONGER TERMS RECOMMENDED.

I should like to recommend to the Federation that they continue to issue these restrictive agreements, but with some slight alterations. While protection for the first year is of the utmost importance to the board track operator, nevertheless it would be to his advantage to have a longer period during which he could be assured of protection.

My opinion in the matter is that we should issue restrictive agreements for 3 or 5 years, that the charges for the first year, when the protection is greatest, should remain the same, but thereafter the yearly charge for restrictive agreement, or so-called franchise, should be a percentage of the original charge, payable yearly in advance. The wisdom of issuing these restrictive agreements has been more than justified. After the success of the Chicago track last year, promoters seemed to be frantic to put up board tracks wherever it was possible to get enough money to build them, in spite of the warning that I repeatedly gave them that even though they could get the public to patronize two or more tracks in any given community, it would be impossible at the present time to supply a large number of tracks with riders.

Had it not been for the restrictive agreement there would undoubtedly have been two tracks in Chicago, and I do not believe that either of them would have been able to obtain enough riders to keep the Chicago public interested.

THOSE PRIZE MONEYS.

In the matter of prizes, it gives me great pleasure to announce that since the establishment of the ruling that prizes must be in the hands of the Referee before the meet is allowed to start and that they should be delivered to the riders immediately after the races were over and before they left the track, I have had very few complaints in the matter of the delivery of prizes. Moreover, the Referee is required to state in his report as to whether the prizes have been delivered or not, and, if not, why not.

During the past year, I have, as Chairman of the Competition Committee, held some \$1,100 for so-called amateurs, almost invariably trade riders who

have won prizes around the city of New York. I originally started to hold this money for the riders, because they were getting most unmercifully "done" by promoters. Fictitious values were ascribed to prizes, and when they were delivered they were so poor that the riders were "kicking" all the time. As long as we have a classification for trade riders I feel that I have done the right thing by seeing that the agreement between the promoters and the riders was carried out to the letter, but I do not hesitate to say that I consider the whole thing very bad in principle. I believe that true amateurs should race for medals and cups, and that these trade riders who have been riding for cash values and the money turned in to me are professionals at heart. While they have bought things of which I have approved (and, in a measure I may be said to have aided and abetted them in it), I feel that I acted under the rules as they exist today. Nevertheless, I do not hesitate to say that I consider the rules wrong and that most of these men are professionals in everything but name, and should be in the professional class. At any rate, if I remain in charge of the Competition Committee, I do not propose to continue this practice any longer. I hope that the Convention will pass such a classification of competitors that will eliminate this very reprehensible practice of so-called amateurs riding for almost everything in sight, from an inner tube up to a house and lot.

RESPECT FOR AUTHORITY.

To the competitors themselves, I wish to express my appreciation of their respect for authority. When you get a crowd of men together, you will always find a certain number who want to "put something across" all the time. I do not believe that all of these men are utterly bad, but that they try to cheat the F. A. M. and the Competition Committee with as little conscience as the average man or woman who goes to Europe and tries to smuggle in something that is dutiable, and consider it part of the game. There are a few, however, who simply cannot be straight—they don't know how—they would rather go round the corner than across the street at any time. These men should be, as far as possible, eliminated as soon as definite proof can be obtained of their crookedness. I believe, however, that most of my suspensions during the past year have erred on the side of leniency rather than that of severity.

PRAISES REFEREES.

Another class of men to whom I wish to pay my respects are the official referees. They have done good work, faithfully and conscientiously, in the face of criticism and abuse, and for a long time without any remuneration whatever, and only recently with remuneration that could be considered any inducement at all. I have attempted, wherever I could find a man who would attend to the business, to put racing in charge of State referees who would have the power to issue sanctions, recommend to me local referees for appointment, collect fees, and, in fact, perform all the duties of the Chairman of the Competition Committee in a given State under my supervision. Inasmuch as I was not in a position to offer these men a salary it has been exceedingly difficult to get men who would attend to the work. Moreover, I would frequently be called upon in a hurry to issue a sanction on short notice and it would be impossible to act through the State referee. Then the State referee would feel hurt. These are all matters that it will take time to adjust, and when you remember that for six months in the year in most parts of the country there is no racing and then it starts with a jump and keeps up at a furious pace for a month or two and then subsides, you can readily see that referees get out of the way of doing things during the idle months; then about the time when I get things working nicely and smoothly, racing is all over for the season. Of course, if I could keep the same men in harness year after year, by slow degrees we would get a splendid corps of officials all over the country.

CHARLES FULLER GATES.

The most striking example of this outrageous treatment of a loyal and hard working official is the case of Mr. Chas. Fuller Gates, of Los Angeles, Cal. When I took charge of the Competition Committee several years ago, Mr. Gates was the referee in Los Angeles. I had not been in office very long before there was a storm of complaints coming in. The burden of the song was about the same excuse that the average woman gives for not marrying some given man, viz., that she doesn't like him. This seemed to be the trouble with people in Los Angeles—they personally did not like Mr. Gates, probably for the reason that Mr. Gates did not go around continually licking the blacking off their boots, but, on the contrary, insisted that things should be run in accordance with his ideas of how they ought to be run. Instead of accepting his rulings and showing him the respect to which his position entitled him, they were continually fighting him, and I have not a doubt in the world that Mr. Gates finally fought back.

THE HANDICAPPING PROBLEM.

Numerous schemes for handicapping motorcycle races have been discussed during the past year and some of them tried out. I believe that the time is at hand when handicappers will have to be appointed for each board track and allowed a fee collected from the riders for each race they handicap, as in the old bicycle days. Where the same machines are used day after day on a board track, the difference in their speed can be fairly accurately determined. As

it is almost imperative to have flying starts on board tracks, the only way that handicapping can be satisfactorily done at the present time would be to make the distance so great that the scratch machine would have to lap its competitor. This is all right for two machines, but when you put three or four machines, all with different handicaps, on a board track, the problem becomes exceedingly difficult and almost impossible of solution.

It has occurred to me that on board tracks where the same machines were being used day after day, it might be possible to so change the gear of a machine as to either reduce or increase its speed so that all of the machines used on a given track would be of very nearly the same speed. If then the management would not allow a rider to have the same machine day after day, thus winning all the prizes, but instead would at the beginning of each meet have the riders draw lots for the machine they were to ride for that meet, I think we could have some real sport. It seems to me, too, that the manufacturers could get some honest advertising by having match races between the crack riders and the crack machines of different factories. For instance, a board track promoter could put on and advertise a special match race between the crack riders and the crack machines of the prominent racing manufacturers in the country, provided, of course, the manufacturers would sign a contract to fulfill their part of the program, viz., to furnish the rider and the machine.

In conclusion, I wish to express my appreciation of your kind attention to this rather lengthy report and to caution you that if you wish to have racing improve in the future as it has improved in the past, and to have the F. A. M. respected and admired, you must be exceedingly careful whom you elect for President and for your Board of Directors, because the appointment of the Chairman of the Competition Committee is entirely in the hands of the President and the Board.

COAST TO COAST.

NO participants in the Northeastern tour, or any of the tours for that matter, attracted more attention or caused more comment than M. E. and Mrs. Gale, of Angola, N. Y. Gale and his wife, on a 7 h. V belt-driven Emblem, left Angola Monday, the 15th inst., for Columbus, which town they reached on time with the other Northeastern tourists. At the conclusion of the meet they started for Indianapolis and Chicago. From the Western metropolis they will travel by way of Omaha, Kansas City, Denver and Colorado Springs to Los Angeles. Having reached the coast it is Gale's purpose to make an effort, in which he is confident he will be successful, to break all transcontinental records.

Aside from the fact that Gale is carrying an extra passenger, his trip is a notable one in that he is using a special contrivance in the form of a double seat astride the center of the machine. It is neither a tandem attachment nor a sidecar, but a combination of both. It looks odd, but both Gale and Mrs. Gale declare it to be perfectly comfortable and safe. They had no trouble whatever in keeping up with and even setting the pace for the other riders in the Northeastern tour, and they expect no trouble in reaching the coast and in making the return trip in record time.

PACIFIC COAST MEET IN 1915?

THE F. A. M. convention went on record as endorsing the plan to hold its national race meet and convention in California in the year 1915, when a World's Fair will be held in San Francisco. Charles Fuller Gates, of Los Angeles, made the proposal to sound out the delegates. Of course the matter is left entirely to the decision of the Board of Directors. According to Mr. Gates, there are several cities in California which want big conventions in 1915 and that it is their intention to let each city have at least one bite. He said that the main convention business could be carried on at Los Angeles, where a day or more of racing could be held on the motordrome, when the convention could pack up its grips and move on to at least two other neighboring coast cities.

LA SALLE'S REPORT.

(Continued from page 27.)

suggested some minor changes, but owing to important National duties was unable to make the necessary changes and do the other work, such as making new copies, etc., so the bill was returned. Boyd had given a good deal of gratuitous service—we didn't feel justified in driving a willing horse to death, so the matter ended there for the time.

A Remedy: Keep the districts. Have a District Law Committee, each member of which is chairman of his State Committee, the District Committee to have supervision over legal matters in its district, under the district vice-president. This will give the committee a territory of reasonable size, so that the committee will not go blind looking for the horizon that bounds the field of its activities. When a law is needed, as in New York, let the State Committee have the matter in charge, and see to it that that committee does its work. If in need of help, it might be that the District Committee would be of aid. With legislation secured in New York, it stands pat that the New York member of the district would have some points helpful to the rest of the committee, when needed.

Local Attorneys: Through the help of local commissioners in the cities and large towns, attorneys should be secured as follows: In case a member is arrested and investigation by the local attorney or the local commissioner, or evidence of the accused, shows that he has violated no provisions of law, the attorney defends the case. If he wins he is to receive the actual costs of the action from the F. A. M., and a moderate fee—established by the National Law Committee—from the defendant. If he loses, he gets no fee, but his costs are paid by the Federation. Legal minds may suggest improvements on this plan, but it stands as a suggestion worthy of consideration.

It should be easy to get the local commissioners to call on the right hotels in their town, get the rates reduced to members when possible—have them sent to the district vice-president, and when the list of his district was complete, he would send it to the National Tours and Hotels Committee.

Routes and maps: There should be through every district a main trunk route—in the Atlantic District, from its southern end via Washington, D. C., through Baltimore, Philadelphia, New York, Albany, Syracuse, Rochester, Buffalo and Erie to the western district limit. The plan: Let the Atlantic vice-president, for example, announce that August 24 next will be Atlantic Tour Day. Beginning at the southernmost affiliated club center, as Washington, go to the next club town north. A man appointed by the president of the Washington club will keep a record of distances, road conditions and so on, and send it in to district headquarters at once. The club to whose town Washington rode will have gone to its next club neighbor to the north in the same way. In New York State, Syracuse will go to Geneva, Geneva to Rochester, Rochester to Batavia and Batavia to Buffalo. Buffalo will go to Erie, and Erie to the end of Pennsylvania. Lying to the south of the trunk in New York, Cortland will go to Syracuse, and Ithaca to Auburn, while in the same way Elmira will go to Geneva or Rochester, and these side routes will be keyed onto the main line. It is important that road conditions be given in a motorcycle tour book. No rider can lay out an itinerary within hours, for a long ride, without this knowledge. The announcement of a District Tour Day, properly spread in the press, would get up a popular interest of value to the cause and would, we are sure, do much to stimulate club interest in touring.

With the Atlantic District—or any other district—data complete, it should be turned over by the District Tours Committee, which will correct it and forward it to the National Tours Committee, to get it into book form as soon as possible. Blank pages may be left in the book for the insertion of new routes, as they are published in the motorcycle press, and at the end of the year this matter may be printed and furnished the members in good standing to be pasted in place.

The National Tours Committee could see that there were no discrepancies at junction points of districts; see that proper sketches of routes are made from standard maps; get the matter all ready for printing and turn the copy over to our secretary for printing. Buying the paper in quantity at wholesale, getting competitive bids for the printing, should get the price of the list of hotels, shops, attorneys, clubs, commissioners, in principal towns and the road information down to a figure possible for us to work on. And the list itself, together with the benefits—which we should have, anyway—would be an effective answer to any question about the need of every rider being with us.

Someone says: "That's a lot of work for one poor district vice-president to do," and I answer, "Yes." No one man can do justice to his job alone, do all the work himself, and have time for anything else. One of our officers suggested to me that it should be feasible to give a per capita of 25 cents per member to a State Commissioner to defray the expenses of his office. Why not apply this plan to the district executive? There is a lot of State work that falls to the Vice-President. He is responsible for his district, he has to keep his hands on the reins at all times. Given a district head who isn't afraid of work; pay him 25 cents per member, new or renew, let him hire some one to do the work while he plans and writes the necessary letters, and we shall have no difficulty getting men of caliber to fill the district offices, who will deliver the goods.

Eliminate the districts, as has been proposed, let the appointment of all State Commissioners lie with one man, with 48 chances of picking inefficient, let

that man be one who wants to use the National presidency as a source of income, let him pick his lieutenants with selfish ends in view, and you have a picture of the possibilities of a condition that has wrecked more than one apparently husky organization. I have one in mind, of recent date, which failed as above.

Again, to do all the work of a real National executive predicates an office outfit of files, more than one stenographer and typist, and demands on the time of any man who has anything in the way of real business, which it would be hard for him to meet. There would be the added expense of the rent of an office, probably, and the duplication of files, card records, etc., now in the district offices. The district plan permits a closeness of acquaintance between the district head and his helpers, impossible with the one-head plan; it stimulates a friendly rivalry between the various districts that is of benefit to the entire body, and it prevents, in a measure, those political combinations which, carried too far, spell ruin for the most healthful organization.

After a long membership in this body we believe that there has never been a time when the various department heads have worked more conscientiously than at present. But we have seen indications that the work of some of the officers has lapped over that of others with added expense. The same thing has featured in big businesses. And notwithstanding that the various departments of these big plants were capably officered, it was taken as no aspersion on the department heads' ability that the services of efficiency experts were employed. The importance of little leaks, small unnecessary expenditures here and there, unneeded movements that hamper the general effectiveness of the whole establishment, and cutting down its output—all these were deemed worthy of study and removal. We believe that no officer of this organization would object if the President elects and the Board of Directors constitutes an efficiency commission, and with a view to increasing our efficiency seek to lay out the work of our various heads so that the most effective work may be done. We believe that much might be accomplished if this were made the first work of our new administration. If it be considered desirable we can furnish a few suggestions looking to improvement along the lines suggested.

There is much we would add to this paper, but fear it already has reached a tiresome length, although we have striven to include only necessary matter. The imperative need for modernizing some of our methods must be very apparent to him who ponders. The day of big things is here. Motorcycling is no longer a sport. The motorcycle has taken its place as a mighty industrial and economical factor. Its users are entitled to every reasonable right and privilege, and it is our duty to see that we live up to our opportunity, and see that our riders receive their due.

AT THE MIAMI PLANT.

AMONG recent visitors at the plant of the Miami Cycle & Manufacturing Company, in Middletown, Ohio, were the riders who appear in the accompanying photograph.

From left to right they are: L. L. Parker, who toured from Denver to the Columbus convention, with his wife occupying the tandem seat; G. H. Snyder, Flying Merkel agent in South Bend, Ind.; Elmer E. Smith, Merkel agent in Richmond, Ind.; John Merz, agent for the Miami machines in Indianapolis; O. Weed, of Indianapolis, and a racing man from Bluffton, Ind., who neglected to place his name on the company's register.

A DUCKWORTH ADDITION.

THE Duckworth Chain & Manufacturing Company, of Springfield, Mass., has been doing business at high tension all season. A material increase in its motorcycle chain business has necessitated provision for larger manufacturing accommodations. Accordingly, within two weeks, work will be started on an extensive addition which the company hopes to complete by early fall.

HUMAN COMETS AT PHILLY

Machines Ridden by Vanderbery and Pancoast Catch Fire as They Spin Point Breeze Bowl.

PHILADELPHIA, Pa., July 13.—In the three-mile race this afternoon Vanderbery, who had ridden a sensational race, had his machine catch fire. When the mishap occurred Van was at the top of the saucer. There was a scream of warning from the spectators and in the next instant the rider swerved his machine downward into the enclosure and fell. He was slightly bruised. His machine was immediately pulled into the swamp surrounding the track and the blaze was smothered. A similar mishap occurred to Pancoast.

In the Class B event Thomas beat Klebes; Hollenback third. In the Class D event Pratt, on an Indian, was first, with Pancoast, Emblem, second, and Gable, Curtis, third. The Class C was won by Hollenback, followed by Veditz; Vanderbery third.

Evening Races.—The first race of the evening was a thrilling affair with five star riders entered. The winner of this event, the first heat of Class B, was Klebes; Thomas, second; Hollenback, third; time, 2:55½. In the final heat of Class B Klebes broke his countershaft. Thomas was second, with Hollenback third; time, 2:20½.

The second Class D race had three riders entered. It was in this race that Pancoast's Emblem caught fire, leaving only two contestants to run the race. The winner was Pratt. The time was 2:35. The final heat of this race was a runaway for Gable.

The Class C event was an exciting race. It was in this event that Vanderbery's machine caught fire, putting him out of the race and leaving Hollenback and Veditz. The race was put off until later in the evening, when Hollenback finished first, Veditz second, Vanderbery third. The time for the first heat was 3:10½. In the final of this event Hollenback won. He suddenly developed a fast streak and passed Veditz in the last mile, winning by over two lengths.

The races on Tuesday evening before one of the largest crowds so far seen at the motordrome were well contested. A special match race between "Speedy" Vanderbery and Frankford Veditz proved very interesting. The event was won by Vanderbery. This is the second time that Vanderbery has defeated Veditz. H. H. Thomas made an effort to break the track record for five miles but failed.

In the 7-mile professional Class B event there were five entrants, Klebes, Thomas, Veditz, Vanderbery and Hollenback. Thomas forged in the front and he and Klebes ran neck and neck almost throughout the four miles, with Hollenback just enough to the rear to come in for the third prize. In the second and final heat of this event the start found Klebes at the pole, with Thomas closely following. In the second mile Thomas' machine broke an exhaust valve, leaving Hollenback to fight it out for second place, closely followed by Veditz and Vanderbery.

The 6-mile professional Class D event was one of the best races of the evening. The entrants were Gable on the Curtiss; Pancoast, Emblem, and Pratt on an Indian. Pancoast was leading by a good margin when his machine suddenly ran hot. Gable then made a runaway of it.

ONE of the entertainment features in connection with the Columbus meet was the banquet rendered by the Meet Club at the Hotel Virginia to F. A. M. officials and motorcycle and accessory manufacturers. There were about one hundred and fifty present, Mayor Karb presiding. Brief addresses were made and stories told by President Hamilton, President-Elect Patterson, Chairman Thornley, of the Competition Committee; Director F. I. Willis, President A. B. Coffman, of the Motorcycle Manufacturers' Association, and "Pop" Johnson, of the Chicago Riverview Motordrome.

PARADE AND BARBECUE.

'Mid showers of souvenirs from the upper stories of the Hotel Virginia, where the headquarters of a number of the manufacturers were located, a procession of 400 motorcyclists set out for a parade of the streets of Columbus at noon on Thursday, July 18, which was to terminate at Olentangy Park for a big barbecue. The wildest sort of a scramble took place as the officials were endeavoring to line up the riders for the parade, when the Yale representatives began tossing valuable leather pocketbooks from their windows on the fourth floor. Bedlam reigned and traffic on the main street was completely blocked until policemen put a stop to the fun. Another chase took place when Goodyear Tire men appeared on the scene with large white parasols bearing the name of that well-known tire brand. In the scramble for these prizes a number of machines were knocked over and it was not until the last "sunshade" had been disposed of that the riders really lined up.

A short tour of the stone-paved streets was then undertaken, the processionists, in the majority of cases, bearing a resemblance to war-painted Indians or wild Zulu chiefs, with their many pennants and badges dangling from every angle of their machines.

At the park, which is located on the banks of the Olentangy river, the F. A. M. boys indulged in looping-the-loop and other sensations which, after their tempestuous touring, seemed of a mild order. The tables, spread under the large trees, were securely roped off until a call was made at 1 o'clock for "eats." Large slices of meat were cut off the big roasting carcasses and the feed assumed the "serve-self" style without invita-

tion. Barrels of potato salad, cauldrons of soup and kegs of pickles were all divided up in no time, and, for the most part, the visitors hied themselves to the bank of the stream with their wooden plates.

The affair became a genuine picnic, and after the feed preparations were made for the playing of different games. Interest was chiefly centered around a long thick rope which happened to be conveniently coiled close by. Young and old took part in impromptu tugs of war while the ladies looked on. A piece of the rope was thrown over the limb of a tree and climbing stunts were next in order, several, including Arthur Davidson, showing considerable aptitude in the hand-over-hand work. The barbecue was one of the most enthusiastic events of the Columbus gathering, the delegates getting considerable pleasure out of the occasion.

THE BIG SMOKER.

THE weather man was against the Columbus boys on Wednesday night when the smoker was held at the motordrome. It rained in the afternoon, and although it cleared up in the evening, the ground surrounding the board track was so muddy that it was unpleasant to tramp upon. Rain threatened in the evening, but despite that fact probably a thousand or more enthusiasts attended the smoker. A good boxing card featured the evening's entertainment. Some of the racers got out their machines and spun off a few miles at a fast gait on the boards, to the great delight of many visitors who had never seen board track riding before. A band furnished music during the evening, and the program was ended with a big "feed" on the grounds.

IN his talk favoring an alliance between the A. C. U. of England and the F. A. M. Mr. Wells brought out the fact that during the past ten or twelve months three hundred American riders have toured in England and have been extended the courtesies of the English organization.

THE TRADE AT COLUMBUS.

AMONG the concerns having exhibits in Columbus during the F. A. M. week, in addition to those mentioned elsewhere, were the Harley-Davidson Motor Company, at the Hartman; the Flying Merkel, at the Southern; the Flanders, at the Chittenden, and the Indian and Thor at the Virginia. Ben Howard was in charge of the Flanders exhibit, while Frank Valiant took excellent care of Flying Merkel riders and many others at the Southern. Incidentally, Valiant had programmed a smoker, which eighty-two Merkel dealers and riders enjoyed at the Southern Friday night after the races. Mr. Valiant was toastmaster.

Valiant remarked to a representative of MOTORCYCLE ILLUSTRATED that never before had so much business been done at an F. A. M. meet. He sold a carload of 1913 machines, assorted models, to the Toledo Sporting Goods Company, of Toledo, and another carload to Newby Brothers, of Kansas City. He also established four new Merkel agencies.

Angsten-Koch Company, represented by Henry and J. P. Angsten, were among those who exhibited at the Virginia, as did also the Eclipse Machine Company, represented by Sales Manager Ferguson and Northeastern Tourmaster and Eclipse Coaster Brake and Clutch Designer Ellett.

Dick and Jack Purdy were on hand the better part of the week, talking and demonstrating the efficiency of the Purdy exhaust whistle and incidentally announcing that they would soon have in readiness for the 1913 market an entirely new model of the chime type.

Representing some two score other manufacturers of machines, parts and accessories, were the following:

The Atlas Specialty Mfg. Company, Mr. Wallheim.

Troxel Mfg. Company, J. W. Brandt and "Heiney" Roberts.

Heitger Carbureter Company, President Heitger.

Emblem Mfg. Company, W. G. Schack and Columbus Agent Taylor.

Miami Cycle & Mfg. Company, Assistant Sales Manager Valiant, J. W. Ash and Designer Joe Merkel.

Hendee Mfg. Company, Messrs. Hedstrom, Weschler, Wells, Buffum, Hunt and Whitney, of the Chicago branch.

Bosch Magneto Company, Al. Bartsch.

Triumph Mfg. Company, George Sherman.
Harley-Davidson Motor Company, Arthur
and Bill Davidson and Assistant Sales Man-
ager Rogers.

Fowler-Carnes Company, I. F. Wilson.

Aurora Automatic Machinery Company, E.
J. Knight.

Beckley-Ralston Company, J. L. Donovan.

Ball Finch Company, of Newark, Ohio,
which is about to move its factory to Colum-
bus, was represented by Manager Neff.

New Era Autocycle Company, Messrs. Ma-
son and McCullom.

Consolidated Mfg. Company, A. B. Coffman,
George Squier and Jesse Campbell.

Excelsior Motor Supply & Mfg. Company,
Sales Manager H. N. Kirk, Aleck Whitfield
and Frank Schwinn.

Wheeler & Schebler, Messrs. Briggs and
Oakley.

Goodyear Tire & Rubber Company, Falor
Bros., Messrs. Hemington, Samuels and Cam-
eron.

Federal Rubber Company, A. J. Zealley, J.
A. Barclay and A. L. DeVault.

Continental Rubber Works, W. J. Surre and
R. E. Sisson.

Diamond Rubber Company, Messrs. Harris
& Ziesloff.

United States Tire Company, Warren O.
Seelye, J. B. Webb and Clarence Welch.

Empire Tire Company, Branch Manager
Gibson, of Indianapolis, and Walter Kallmeir.
Indiana Lamp Company, Mr. Thoms.

Representing the Standard Welding Com-
pany, of Cleveland, were Messrs. J. C. Matter-
nach, B. G. L. Dodge, Bert Quayle and Fred
Wilhelmy. Mr. Matternach announced that
the Standard Welding Company is now
ready to deliver rims in accordance with the
new specifications. The factory facilities have
recently been increased in anticipation of a
much greater demand than that of last year.
Samples may now be had by manufacturers
upon request.

Wherever, in Columbus during the past
week, manufacturers, dealers or riders were
likely to congregate, Corbin coaster brake lit-
erature and Corbin "steel-shaving" cigars
were always in evidence. It is almost un-
necessary to explain why. The ubiquitous A.
H. Harrop was the reason.

Smiling Dave Smith, whose fame for good
fellowship extends from coast to coast, was
present all the week in behalf of the Standard
Company and the Splitdorf Electrical Mfg.
Company. Mr. Smith announced that 1913
models of the Splitdorf magneto would be
of the armored type and that the company
would be ready to make deliveries about
Dec. 1.

M. B. Sullivan, who has been connected
with the Splitdorf company for many years,
rode his machine, fitted with a Splitdorf mag-
neto, from New York to Columbus with the
Northwestern tourists and reported an entire
absence of ignition troubles.

Other motorcycles represented were the
Henderson by Vice-President Henderson;
R.-S., by W. F. Remppis; Minneapolis, by
Harold Turner; the new Dayton, by President
Lester and Sales Manager H. M. Huffman,
of the Davis Sewing Machine Company, and
the Pilot by Al. Oberwegner, of the Oberweg-
ner Motor Company.

Hawthorne Mfg. Company, manufacturers
of "Old Sol" lamps, Thomas M. Dunham.

Kokomo Rubber Company, Lon Spraker.
Persons Mfg. Company, W. E. Eccles.

HEARD in the CROWD

AN ocean-to-ocean relay race proposal was
made before the national F. A. M. con-
vention in Columbus by Dr. Patterson last
week. All that Dr. Patterson asked the as-
sembly to do was to put its stamp of approval
upon the scheme.

The idea is to see how fast a message can
be carried from coast to coast by means of
the motorcycle. It is planned to have three
men start with a message from Los Angeles.
The original three men will carry the message
for perhaps 200 miles or more, when they
will be relieved by three other men, who will
make the second leg of the journey. The second
set of riders will be relieved by a third,
and so on until the final relay carries the mes-
sage into New York City.

There were seven delegates from Roches-
ter, N. Y., who made themselves conspicuous
by wearing loud green "lids" at the conven-
tion. The "wearers of the green" were J. A.
Oaks, W. A. Fisher, A. Strobel, G. P. Stroger,
H. Dublin, F. Dublin and G. J. Wagner. Wag-
ner played an important role in the conven-
tion.

President Hamilton was "impeached" from
his chair for a time Saturday morning while
Howard French took the gavel. The "im-
peachment" came at the request of Dr. Thorn-
ley. Just as soon as Mr. French had taken
the chair Dr. Thornley offered a resolution
providing for an appropriation of \$95 for a
gold watch, which was later presented to Mr.
Hamilton in appreciation of his services as
president of the F. A. M.

The watch was passed around the room so
that all could see it. Duncan, of Rochester,
wanted to "swap" with Hamilton, but the lat-
ter refused.

It seemed as though everybody went to the

races either in automobiles or on motorcycles.
Columbus may boast of good streets, good
water and extra fine dust.

Many of the boys had to "double up" with
others in order to get accommodations at the
Virginia.

The Columbus Club and dealers are to be
congratulated. Everything went off smoothly.

W. A. Gibson, of Indianapolis, came to Co-
lumbus to inspect the board track, as he is
planning to build one in Indianapolis.

Much speculation was in order in regard
to naming the place where the national con-
vention will be held next year. There was
talk of Cleveland, Toledo and Indianapolis.

Thornley brought out a hearty laugh when,
while the attitude of the Amateur Athletic
Union was under discussion, he jocularly re-
marked: "Chairman Sullivan is even more
pig-headed than I am."

When the question of limiting amateur
riders to a hundred-mile radius was under
discussion Treasurer Wagner, of the Roches-
ter Club, called attention to the fact that the
riders of Elmira, which is just 105 miles dis-
tant from Rochester, often took part in
Rochester race meets. "Happy" Howard
French promptly moved that in order to con-
form with the rules Elmira be moved five
miles nearer to Rochester.

Hastings is again restored to his amateur
standing in athletic sports. When President
Hamilton called for the single vote that
might have kept him in the professional ranks
there was not even a whisper.

The Hall amendment providing that the
business sessions of the F. A. M. should be
held in the winter might have been passed at

Buffalo last year, but the attendance of dele-
gates at the Columbus sessions was so good
and the business transacted so satisfactorily
that the suggestion of the Brooklynite met
with practically unanimous defeat.

Announcement was made in Columbus that
Charlie Balke has been re-engaged to ride
in the Indian camp.

The Columbus meet was distinguished from
all previous occasions of a similar character
by an unusually representative attendance of
trade people.

HANDY ATLAS SOUVENIR.

THE Atlas Specialty Manufacturing Co., of
Chicago, represented in the convention
city by C. J. Wollheim, room 507, Virginia
Hotel, gave away a really useful souvenir
in the shape of a spark plug pocket. This prac-
tical little memento was eagerly sought after
by the boys. Mr. Wollheim states that a large
amount of business was transacted at the
meet. In this connection Mr. Wollheim ad-
vises that the Atlas Specialty Manufacturing
Co. are increasing their capacity, thus enabling
them to cope successfully with the rush of
business which they have been handling heret-
ofore with some slight delay.

BARR IS PRESIDENT.

COLUMBUS, Ohio.—Just previous to the
F. A. M. meeting in Columbus a reor-
ganization of the Columbus Motordrome Co.
was effected. P. A. Vogel, who has been presi-
dent of the corporation since its organiza-
tion, resigned that position and was suc-
ceeded by C. E. Barr, who had been vice-
president. A. C. Edwards was elected vice-
president to fill the vacancy caused by the
advance of Mr. Barr. W. H. Snyder con-
tinues as manager.

AT THE HAMILTON MEET.

THAT Canadian motorcyclists made the most of their opportunity to enthuse over the championship races held at Hamilton, Ont., on July 1, is evident from the line-up of machines and riders appearing in one of the accompanying photographs. The picture was obtained in one of the parks before the meet and shows a comparatively small number of those who rode to Hamilton for the races. It will be noted that there are many women enthusiasts in the party, and that side-cars came in for their share of attention. A group of the passenger "baskets" may be seen at the left of the photograph.

The other picture shows several well-known racers and K. R. Spencer, president of the Canadian Motorcyclists' Association. From left to right: Joe Baribeau, of Winnipeg, one of the best known speedsters of the Dominion; Don Klark, of Detroit, the Indian rider; Frank Kerr, of Toronto; President Spencer and Harold Cole, the youthful rider who held the Canadian championship last year. The photographs are published by courtesy of the Dunlop Tire & Rubber Goods Co., Ltd., of Toronto.

PACIFIC DISTRICT MEETING.

TACOMA, WASH.—One hundred motorcyclists, members of the F. A. M., met July 3 at the quarters of the Seattle Motorcycle Club, Fortieth avenue and Madison streets, for the semi-annual meeting of the Pacific district. After a short business meeting at which nominations for various officers were made, the members and their guests enjoyed a banquet, with the out-of-town visitors as honorary guests. J. B. Lindsay, of the Portland Motorcycle Club, was the choice of the meeting for vice-president of the district. Walter Sterling, of Seattle, was the nominee for secretary, and Floyd R. Ritchie, of Hoquiam, for treasurer.

The Seattle Motorcycle Club is the largest in the district, which comprises Washington, Oregon, Montana, Idaho and Wyoming. There are now 120 active and enthusiastic members, and they find their new home spacious and cozy. Of the Portland Club there were present at the banquet J. B. Lindsay, A. G. Dunnehan, E. O. Lucas, C. J. Ford, W. P. Brush and Elvin Condit.

TEN RIDERS FINISHED

In Baltimore Run into Pennsylvania, but Only Five Managed to Keep Their Scores Clean.

BALTIMORE, Md.—The endurance run of the Chesapeake M. C. to Lancaster, Pa., over a 200-mile route, on Sunday, June 30, was a great success. Out of the nineteen entries twelve started and ten finished. This was the first long cross-country run held in this section this year. The members of the club are so well pleased with the results that they have determined to make other similar trips.

The roads on the way to the Keystone city were found in fairly good condition and the checking points were made on time by five of the riders, who came through with perfect scores. The other five were penalized for various reasons. There were no bad spills. The route was by way of Reisterstown, Westminster, Littlestown, Hanover, Abbottstown, York and Columbia to Lancaster. There were

ten prizes contributed by dealers. Those who finished were as follows:

	Points.
Samuel C. Brown, Thor 7.....	100
W. D. Hoffman, Indian 5.....	100
E. C. Roof, Indian 7.....	100
Chester Sherman, Merkel 4.....	100
C. H. Lederer, Flanders 4.....	100
George W. Coggins, Yale 4.....	99
Fred Kuhl, Indian 7.....	74
Herbert Vetter, Yale 4.....	49
Frank Hughes, Yale 4.....	25
A. H. Herklotz, Thor 3½.....	24

TO HOLD BEACH RACES.

RACES will be held by the Galveston (Texas) Automobile Club on the beach track August 8-10, and several events for motorcyclists have been listed. Applications for entry blanks should be addressed to L. Lee Adams, 405 Caroline street, Houston, Tex.

THE Johnson Cycle Company, 420 Waccuta street, St. Paul, Minn., has taken the agency for the Pope motorcycle.

CHAPPLE CLIPS TWO MARKS

Lowers One-Mile and Thirty-Mile Records in Whirlwind Events on Brighton Bowl.

ARTHUR CHAPPLE rode in invincible form at the Brighton Beach Motordrome Tuesday night, July 23, when he broke two track records. The first record to go was the one-mile mark of $39\frac{1}{4}$ seconds, which he lowered to $39\frac{1}{2}$ seconds. The second time reducing feat occurred when he won the feature event, the international thirty-mile championship, in 21 minutes $38\frac{1}{2}$ seconds, as against the old record of 23 minutes 25 seconds. To do this Chapple had to cover the thirty miles at the rate of 87 miles an hour. Wray, Cox and Mercier finished in that order behind Chapple.

Chapple finished over five miles ahead of Wray. He was completely exhausted by the long grind, and had to be helped from his machine blind and in a fainting condition.

Chapple went out to annihilate time and space from the very start, gaining five laps in the first five miles on Wray and Cox, who were fighting it out for second. In the next five miles he gained only one lap, but from then on he continued lengthening his advantage until he finished with his big lead of one-sixth of the distance covered. Chapple was the only one of the five starters who did not drop out of the race at any time. Costello quit for good at the second mile.

Because of motor trouble Cox dropped out at sixteen miles to replenish his oil supply and was not ready to resume until Wray had gained about a mile over him for second place. But Wray had to drop out at almost the same time, so they were both out together. Cox got off again earliest, but the two riders stuck together until the end, when Wray finished a mile ahead of his rival for second honors. Mercier was fourth.

Mike Costello, though still new as a professional, took all three heats in the professional five-mile race. He went out ahead from the start in the first two heats, winning the opener by half a lap and the second trial by 100 yards. The last was a harder fought race, but Costello outgeneralled them all, coming up from the rear in the last lap and winning by twenty-five feet. The summaries:

Two-mile amateur—First heat won by Reggie Lyons; Ira Vail, second; Jimmie French, third. Time, 1:48. Second heat won by Lyons; French, second; Vail, third. Time, 1:49½.

Five-mile professional—First heat won by Mike Costello; Billy Wray, second; Ferdie Mercier, third; Johnny Cox, fourth. Time, 3:36. Second heat won by Costello; Wray, second; Cox, third; Mercier, fourth. Time, 3:40½. Third heat won by Costello; Cox, second; Mercier, third; Wray, fourth. Time, 3:51½. Race won by Costello with 15 points; Wray, second with 7 points; Cox, third with 6 points; Mercier, fourth with 5 points.

Three-mile exhibition—Johnny Albright of Denver. Time, 2:11½.

International championship, 30 miles—Won by Chapple; Wray, second; Cox, third; Mercier, fourth. Time, 21:36½.

One-mile time trial to lower world's record of $39\frac{1}{4}$ —Arthur Chapple of New York. Time, $39\frac{1}{2}$.

BRIGHTON, N. Y., July 12.—A number of exciting events were held on the Brighton motordrome tonight, the chief being the five-mile pro heats in which Billy Wray and Charlie Davis figured. In the first heat "Smiling Johnnie" Cox rode against Wray and Davis, but had to retire because of a disabled oil-pump and connections. Wray and Davis fought it out, touching knuckles several times during the event. Wray finally won, in $3:52\frac{1}{2}$. In the second heat Chapple won, but the inter-

est of the spectators was again centered on Davis and Wray, who rode wheel to wheel and touched several times. Wray came second and Davis third. In the third heat Davis took second place and Wray third, Chapple winning again. In the final event, a five-mile handicap, Albright, of Denver, was an added starter, and gave one lap to Wray and Davis. Albright dropped out through lack of fuel before completing the third mile and Wray won.

In the amateur match race between Constant and Costello, the former won by half a wheel-length. The attendance was 8,000. The track was slightly damp. Summaries:

Amateur match, 3 miles—Won by J. U. Constant (7 Indian); second, Mike Costello (7 Merkel). Time, 2:15.

Three-mile time trial—John Albright (7 Indian). Time, 2:07½.

First heat, pro., 5 miles—Won by Billy Wray (7 Indian); second, Charles Davis (7 Indian); third, John Cox (Baxter-J.A.P.). Time, $3:52\frac{1}{2}$.

First heat, match, Albright vs. Mercier, 5 miles—Won by Albright. Time, 4:05½.

Second heat, pro., 5 miles—Won by Chapple; second, Billy Wray; third, Charles Davis (all on Indians). Time, $3:53\frac{1}{2}$.

Second heat, match, Albright vs. Mercier, 5 miles—Won by Albright. Time, 4:08½.

Third heat, pro., 5 miles—Won by Chapple; second, Davis; third, Wray. Time, 4:03.

Five-mile pro. handicap—Won by Wray (1 lap); second, Davis (1 lap). Albright (scratch), out. Time, $3:53\frac{1}{2}$.

SNAPPY PRO EVENTS

Albright and Veditz and Chapple and Wray Figure in Match Races on Brighton Saucer.

BRIGHTON BEACH, July 17.—Most of tonight's program was run off before rain set in and the track became unrideable. The main interest centered in the local pro events, in which Mike Costello starred. Unusually interesting were the matches between Albright and Veditz, the latter of Philadelphia, and between Chapple and Wray. In the Albright-Veditz events, the former won both, his times for the three miles being respectively $2:26\frac{1}{2}$ and $2:28\frac{1}{2}$. Chapple won both his heats in $2:21\frac{1}{2}$ and $2:25\frac{1}{2}$. Costello took first place in the first and final heats of the five mile pro, losing the second to "Smiling Johnnie" Cox. The attendance was good. Following are the summaries:

Three-mile time trial—Arthur Chapple (Indian). Time, 2:13½.

First heat, five-mile pro.—Won by Mike Costello; second, John Cox; third, Ferd. Mercier. Time, 3:43.

First heat, three-mile match race, Albright vs. Ray Veditz—Won by Albright. Time, $2:26\frac{1}{2}$.

First heat, match race, three miles, Chapple vs. Billy Wray—Won by Chapple. Time, 2:21½.

Second heat, pro.—Won by John Cox; second, Costello; third, Mercier. Time, $3:48\frac{1}{2}$.

Second heat, match race, Albright vs. Veditz—Won by Albright. Time, $2:28\frac{1}{2}$.

Second heat, match race, Chapple vs. Ray—Won by Chapple. Time, $2:25\frac{1}{2}$.

Final heat, five-mile pro.—Won by Costello; second, Mercier; Cox out. Time, $3:44\frac{1}{2}$.

BRIGHTON, July 16.—Tonight's star event was the 25-mile professional, won by Albright. The summaries:

First heat, amateur, 3 miles—Won by J. French (7 Indian); second, Jas. Friederich (7 Merkel). Time, $2:57\frac{1}{2}$.

Three-mile time trial—Arthur Chapple, 2:11½.

First heat, pro., 5 miles—Won by John Albright (7 Indian); second, Mike Costello (7 Merkel); third, F. Mercier (7 Indian). Time, 3:41.

Second heat, amateur, 3 miles—Won by J. French; second, Jas. Friederich. Time, $3:02\frac{1}{2}$.

First heat, match race between A. Chapple and F. Mercier, 3 miles—Won by Chapple. Time, $2:18\frac{1}{2}$.

Second heat, pro., 5 miles—Won by J. Albright; second, Mike Costello; third, Ferd. Mercier. Time, 3:44.

Second heat, match, Chapple and Mercier, 3 miles—Won by Chapple. Time, $2:18\frac{1}{2}$.

Twenty-five-mile pro. race—Won by John Albright; second, Ray Veditz. Vandenberg and Mercier retired. Time, 21:03½.

ALBRIGHT WINS FROM WRAY

Denverite Captures Match Event and Hollenbeck Romps Off with Feature Pro Race.

BRIGHTON BEACH, July 20.—The Albright-Wray match events to-night shared the interest of the fans at the Motordrome with the five-mile pro heats and the final handicap. In the first heat of the match Albright won, covering the four miles in $3:02\frac{1}{2}$, with Wray a good second. In the second heat Wray pushed the Denverite hard, but the latter won by a small margin in 3:08. "Smiling Johnnie" Cox, on an Indian, opened out and led the field by about half a lap during the first pro heat; his time was $3:43\frac{1}{2}$. In the second heat the visitor from Philadelphia, "Billy" Hollenbeck, demonstrated his capacity for speed and followed Cox's example, although closely pursued by Wray. Hollenbeck won in 3:54. In the final heat Hollenbeck again won, leading Cox by only a wheel over the tape. In the handicap Albright completed but two miles of the six and retired with a disconnected magneto lead. Wray ran out of oil and suffered bearing troubles, quitting in the fourth mile. Hollenbeck, the survivor, covered the 17 laps in 4:24. The weather was clear until the final, when rain fell. A large crowd cheered on the racers. Several straw hats escaped from their owners and much amusement was caused by the efforts of an official to scale them from the infield to their owners in the bleachers. The summaries:

First heat, amateur match, 2 miles—Won by Jim French (Indian); second, Otto Berke (Merkel). Time, 1:57.

Three-mile exhibition—John Albright. Time, 2:13. First heat, pro., 5 miles—Won by J. J. Cox (Indian); second, Hollenbeck (Indian); third, Mercier (Indian). Time, $3:43\frac{1}{2}$.

Second heat, amateur match, 2 miles—Won by Jim French; second, Otto Berke. Time, 1:55.

First heat, match, Albright vs. Wray—Won by Albright. Time, $3:02\frac{1}{2}$.

Second heat, pro., 5 miles—Won by Hollenbeck (Indian); second, Mercier; third, Cox. Time, 3:54.

Second heat, match, Albright vs. Wray—Won by Albright. Time, 3:08.

Third heat, pro., 5 miles—Won by Hollenbeck; second, Cox; third, Mercier. Time, $3:44\frac{1}{2}$.

Six-mile pro. handicap—Won by Hollenbeck (1 lap); Albright (scratch) out, 2 miles; Wray (2 laps) out, $4\frac{1}{2}$ miles. Time ($5\frac{1}{2}$ miles), 4:24.

The races scheduled for July 21 were postponed on account of rain.

A TANDEM HONEYMOON.

SAN JOSE, Cal., is the scene of another motorcycle honeymoon. George T. Van Nortwick, an electrician of Oakland, and Miss Lorna Doane Feathers, astride a motorcycle, journeyed from Oakland to San Jose. Their first stop was at the county clerk's office, where the marriage license was obtained. After they were married by Judge Dougherty and given the benediction of the court, they left for a honeymoon ride about San Jose.

A SOCIABILITY RUN.

THE Allen Motorcycle Club, of Allentown, Pa., held a sociability run on July 14 to Delaware Water Gap and return. The riders assembled at the club's headquarters and proceeded by way of Bethlehem, Wind Gap, Salersburg, Stroudsburg to the Gap. They had a special dinner at the Gap and returned late in the afternoon over the same route.

INDIANAPOLIS RIDERS ENTERTAINED BY GUS HABICH ON BIG OUTING AT HIS SUMMER CAMP

PROGRESS ON ROAD BILLS.

WASHINGTON, D. C.—Senator Warren, of Wyoming, has succeeded in having an amendment providing for \$77,000 for the purpose of building four motor roads, one from each approach to the entrance to Yellowstone Park, and connecting with the main road which passes all the principal points of interest in the park. Motor vehicles are now excluded from the park. Senator Myers, of Montana, had a wordy war with Senator Reed,

of Missouri, over an amendment to the sundry civil bill providing for \$77,000 to be used in building new roads and trails and making plans for road improvements in the Mount Rainier National Park, Washington. Senator Reed unsuccessfully sought to have the provision eliminated. It has not yet passed the Senate but the chances are that it will. The amendment of Senator Heyburn, of Idaho, for \$250,000 for motorcycle and automobile roads inside the Yellowstone National Park has not yet come up for action.

GOOD ROADS CONGRESS.

WASHINGTON, D. C.—President Taft and Governor Woodrow Wilson will meet, shake hands, and join in the boosting of the Good Roads movement at the American Road Congress to be held at Atlantic City, September 30 to October 5, inclusive. At this Congress all the organizations interested in highway improvements will be represented, including more than fifty State, county and local associations that are working with the American Association.

RACERS MUST USE CARE

Because of Recent Accidents Salt Lake Speedsters Will Be Fined for Recklessness.

SALT LAKE CITY, UTAH.—Because of the accidents which have been taking place on the Wandamere motordrome during the last month, W. D. Rishel, referee of the track, has announced that any rider making a move that is "not according to Hoyle," will be promptly fined. He carried this into practice by fining Ben Johnson \$10 for close riding in the meet on July 12.

Whittler broke the one-mile track record made by Ray Seymour last year. He rode the mile in 41.03, lowering the old record by three-fifths of a second. In the six mile race, Brodbeck, McNeil and Bernstrom were well matched. Whittler was there, riding in front and then behind, until the last lap, when he went around and finished first. McNeil, who had been giving Brodbeck plenty to think about, ran out of gasoline and was forced to quit. Bernstrom finished a close third.

The three-mile professional point event between Brodbeck, Bernstrom and McNeil was the best race of the evening. All three heats were hotly contested, and McNeil won from Brodbeck with Bernstrom third.

NOVEL ECONOMY TEST.

OF more than passing interest is the accompanying photograph which shows the contestants lined up for the start of a recent economy test in Oakland, Cal. It will be noted that at the extreme right four riders are mounted on one machine, a two-speed Indian.

One of the tandem riders was a woman enthusiast who is shown at the left. J. P. Swanson, mounting the Harley-Davidson which appears in the center of the picture, won the event by traveling five miles on nine and a quarter ounces of gasoline. Swanson is a member of the Oakland M. C.

Ralph Rognon showed up well in winning the sixth event. The first event that he was entered in was somewhat of a disappointment to him, as he carelessly entered the race without filling his oil tank. Summaries:

Three-mile professional point race, first heat; McNeil, Indian, first; Brodbeck, Merkel, second; Bernstrom, Indian, third. Time, 2:17½; second heat, Brodbeck, Merkel, first; McNeil, Indian, second; Bernstrom, Indian, third. Time, 2:15; third heat, McNeil, Indian, first; Brodbeck, second; Bernstrom, third. Time, 2:15:1. Final points, McNeil, 8; Brodbeck, 7; Bernstrom, 3.

Four-mile professional; O. Johnson, Merkel, first; Duckworth, Indian, second; B. Johnson, Indian, third. Time, 3:14.

One-mile record trial; Seymour's time 42:2, Whittler's time, 41:3.

Five-mile professional, B Class; R. Rognon, Indian, first; Johnson, Indian, second; McCall, Indian, third. Time, 3:54½.

Six-mile A Class; Whittler, Merkel, first; Brodbeck, Merkel, second; Bernstrom, Indian, third. Time, 4:27½.

TWELVE SCORES INTACT

Thirty Riders Started on Reading Run but Heavy Going Soon Reduced the Ranks.

READING, Pa.—Out of 30 starters 12 finished with perfect scores in the endurance run of the Reading M. C. on July 14. The start was made from Reading at 6 a. m., and the route led through Norristown and Philadelphia to Easton, where an hour was allowed for dinner. From Easton the riders proceeded to Allentown and then returned to Reading. The total distance covered was 170 miles and the actual riding time was 9 hours 15 minutes. The competitors and their scores were as follows:

Dan Hart, Indian	1,000
James Mayo, Merkel	1,000
Wm. Buel, Harley-Davidson	1,000
Sam. Killian, Indian	1,000
P. Maurer, R-S.....	1,000
Jacob Deysher, R-S.....	1,000
Wm. Stoudt, R-S.....	1,000
Samuel Nye, Indian	1,000
Wm. Henry, Indian.....	1,000
James Dunkel, R-S.....	1,000
Ezra Hartman, Excelsior.....	1,000
Ben Pike, R-S.....	1,000
Robt. Haenchen, R-S.....	969

Chas. Hart, Indian.....	967
John G. Nuebling, Indian.....	956

"GRIP-TITE" GLOVES.

HAND in hand with the progress of the motorcycle, the live manufacturing concerns of the day are taking progressive strides which are of more and more assistance to ardent motorcyclists. The latest thing is a new glove, with a double corrugated palm and double thumb which insures perfect control at all times with almost no effort. The corrugations easily grasp the ridges of the control, and relieve the rider of the former strain of constant effort to retain a firm grip.

The wearing qualities of the "Grip-Tite" gloves are unusual, for not only is the glove made of an exceptional quality of washable, ever-pliable leather, but the double palm is an additional wearing feature, and when at last it wears out, it can easily be ripped off, and leave still a practically new pair of gloves. In preparing this "Grip-Tite" glove the manufacturers, the Morrison-Ricker Manufacturing Company, of Grinnell, Iowa, has taken a step in the motorcycling field, which will prove of benefit to hundreds of riders, as well as to themselves.

SHORT GRASS TOUR.

ACCORDING to President-Elect Patterson, who is in charge of the Short Grass Tour, entries are coming in with satisfactory rapidity, but inasmuch as there will be accommodations for two hundred tourists about twenty-five or thirty more can be accommodated. Those who wish to take part should communicate with Dr. Patterson, at Pratt, Kan., at once. The start will be made August 11, and a fortnight of pleasure may be had for the nominal outlay of \$30 for the entire trip.

The Late Bob Hunter and Brownie Carslake.
Below—Finn Huttering, of the Cleveland Motordrome.

IN the accompanying photographs appear a number of the riders who were featured in the races held at Saugus, Mass., on July 4. Picture No. 1 shows Collins at the left, mounting his Indian, and DeLong with his Excel-

sior; No. 2 shows the boys lined up for the start of the 25-mile race—from left to right they are Crandall (Thor), Firman (Indian), Smith (Excelsior), and Carroll (Indian); No. 3 shows DeLong at top speed in the ten-

mile event which he won; No. 4 gives a view of Crandall (Indian) rounding a turn wide open. The photographs are forwarded by C. E. DeLong, of the Hub Motorcycle Company, of Boston.

WICHITA WINNERS.

WICHITA, KANSAS.—A 180-mile run from Wichita to Cottonwood Falls, Kansas, was held by the Wichita M. C. on July 8, ten members of the club making the trip. Although only the second run, this contest closes the series because the three riders who won trophies in the first run repeated their victories yesterday. The Wichita club had purchased three cups to be contested for by trade riders, professionals and private owners, Wells Bennet, a professional rider, John Branson, in the trade class, and G. E. Woodwell of the private owners' division, all of whom won firsts on the first run, occupied the same positions in the July 8 run and thereby became the permanent owners of the cups. Checks for the run were maintained at Wichita, Peabody and Cottonwood Falls, and there were two secret controls, making ten time checks in all.

Bennet rode an Indian single, the machine on which he won two races in the Winfield (Kansas) meet on July 4. Woodwell rode a twin Excelsior 6 and Branson an Excelsior 7. Besides these men, Frank Kenegy, on a single Indian, F. A. Honer on a twin Merkel, and Paul Garst on a single Harley-Davidson made perfect scores. The run was made on a 20-mile-an-hour schedule.

PLAN ANOTHER MEET.

MINNEAPOLIS, Minn.—So successful was the racing meet held in this city a week ago under the auspices of the Minneapolis Motorcycle Club that the promoters have decided to stage another contest, prob-

ably the latter part of August. Otto Frykman, who managed the contest, will again assume the duties of manager for the coming meet. He has already started a scouting campaign to see if some professional or trade riders can be secured. Members of the club are of the opinion that the contest should be held on Saturday, August 31, which is just two days before the opening of the Minnesota State Fair, as there are then thousands of people in the Twin Cities.

THAT SAN JOSE SPILL.

WILL T. BAKER, of San Jose, Cal., appears in the accompanying photograph on the machine with which he was competing in a race meet on June 30 when he figured in a fatal spill. Baker and Reed Orr, the latter of Sacramento, both succumbed to their injuries. A broken exhaust pipe was dropped from one of the racing machines and in trying to avoid striking it a rider named House went down, carrying C. D. Reade with him. Baker and Orr crashed into the fallen machines.

PECK AND WEST DIVIDE HONORS.

NEWARK, July 20.—Ray Peck and Fred West, both California pros, cleaned up in their respective classes at the Motordrome today. Peck won his events with ease, but West fought it out with Charlie Davis, of Brooklyn, who finished a close second in the three heats. The Class B men showed speed in the three-mile events, being only 1-5 of a second slower than the Class A for the same distance. The summaries:

New Jersey club race, amateur, 4 miles—Won by Brown (Indian); second, Segelbach (Indian). Time, 3:20¾.

Class B, pro., 2 miles—Won by Fred West (Indian); second, C. Davis (Indian); third, Johnny King (Indian). Time, 1:30¾.

Class A, pro., 2 miles—Won by Ray Peck (Excelsior); second, Larry Fleckenstein (Indian); third, F. A. King (Indian). Time, 1:29¾.

Exhibition to establish one and two-lap record for four-lap track, by Ray Peck—First mile, 0:42¾; second mile, 1:23¾.

Class B, pro., 3 miles—Won by West; second, Davis; third, Carlson. Time, 2:14¾.

Class A, pro., 3 miles—Won by Peck; second, Fleckenstein; third, King. Time, 2:14¾.

Class B, pro., 5 miles—Won by West; second, Davis; third, Carlson. Time, 3:49¾.

Class A, pro., 2 miles—Won by Peck; second, Fleckenstein; third, King. Time, 1:29¾.

Free-for-all, 6 miles—Won by Peck; second, Fleckenstein; third, West; fourth, Davis; fifth, King. Time, 4:29¾.

PORTLAND RACES.

PORTLAND, ORE.—Vern Maskell, riding a 7 h. stock Indian, won the big event of the Portland Motorcycle Club meet at the Country Club track on July 7, covering ten miles in 9:28¾, in competition with a seven Thor and an Excelsior. The fastest mile of the day was made in this event, Brant, on the Thor, making a round of the oval in 55 sec-

onds, one second slower than the record at the last meet held by the club. Over 3,000 enthusiasts turned out for the occasion.

Five miles, 30.50 class, stripped stock—Brush (Merkel), first; Vucick (Excelsior), second; Hall (Excelsior), third. Time, 5:35.

Six miles, 30.50 class, ported—Hill (Harley-Davidson), first; Godfrey (Indian), second; Brown (Merkel), third. Time, 6:26.

Five miles, 61 class, stripped stock—Brant (Thor), first; Maskell (Indian), second; Peppel (Excelsior), third. Time, 4:47.

Pursuit race—Archie Taft (4 h. Excelsior), won in 20th lap.

Eight miles, 30.50 class, ported—Berreth (Indian), first; Nowotny (Indian), second; Hill (Harley-Davidson), third. Time, 8:10 1/4.

Ten miles, 61 class, stripped stock—Vern Maskell (Indian), first; Peppel (Excelsior), second; Brant (Thor), third. Time, 9:28 3/4.

Five miles, 30.50 class, stock belt—Brush (Merkel), first; Hall (Excelsior), second; Allen (Pope), third. Time, 5:36 1/4.

Five miles, 61 class, stripped stock—Maskell (Indian), first; Peppel (Excelsior), second; Brant (Thor), third. Time, 4:47 3/4.

Officials—J. B. Lindsay, referee; H. E. Mead, clerk of course; C. Menizes, R. L. Short and H. W. Reibenstein, judges; Bruce Campbell, De Witt Harry and E. Jaeger, timers; C. H. Hassenpflug, George Douglas and H. A. Eyl, scorers.

BAD SPILL MARRED MEET.

DUBUQUE, IOWA.—A shadow was cast over an otherwise successful meet here on July 7 when Sylvester Henry Cody, a professional rider, sustained fatal injuries in a 10-mile open event. Cody attempted to crowd in between two other riders but collided with one of them and was hurled to the track. E. J. Meisel, of Cedar Rapids, could not clear the fallen rider and his machine passed over Cody's chest, inflicting mortal injuries. Summaries:

Five miles, private owners, stock—Risenger, of Maquoketa, first; Ray Miller, of Dubuque, second; Volenweider, of Peosta, third. Time, 6:17.

Ten miles, open pro., 30.50 class—Yonkers, of Cedar Rapids, first; R. Hitchcock, of Davenport, second. Time, 11:23 1/4.

Six miles, open pro., 30.50 class—Yonkers, first; Hitchcock, second; J. Meisel, of Cedar Rapids, third. Time, 6:43.

Seven miles, private owners, 61.00 class—Alvord, of Davenport, first; Hansen, of Davenport, second; Wright, of Davenport, third. Time, 9:34.

Ten miles, open pro., 30.50 class—Yonkers, first; Meisel, second; Hitchcock, third. Time, 11:03.

DAVIS FATALLY HURT.

HARRY B. DAVIS, of Salt Lake City, Utah, a recent recruit to the racing ranks at the Wandamere Motordrome, sustained fatal injuries when he lost control of his machine while spinning the bowl at top speed. Davis struck a pole supporting an arc lamp with such force that the entire lighting system of the track was disabled. His machine charged into the crowd and injured seven spectators.

A WILLIAMSPORT RACER.

E. G. Staldes.

IN the accompanying photograph E. G. Staldes, of Williamsport, Pa., is shown with the Flying Merkel machine on which he has ridden some spectacular races of late. Staldes is a speedster who is always ready to test his nerve and endurance against a rival and he is counted upon to enliven any meet at which he appears.

W. H. HARTER, mounting an Excelsior 7, captured the 3-mile road race at Rising Sun, Ohio, on July 4, by finishing the event in 2:58.

KRACKOWIZER'S RECORD

Monarch Rider Covers 496.6 Miles in Twenty-Four Hours and Sets New Road Mark.

MOUNTING a 5 h. single-cylinder Monarch, H. J. Krackowizer, well-known in motorcycle circles in New York and vicinity, established a new 24-hour road record for the single-tracker July 6-7 by riding 496.6 miles over a course laid out between Utica, N. Y., and East Syracuse. Krackowizer's actual riding time was 21 hours 25 minutes.

The start was made from Genesee and Columbia streets, Utica, at 6 p. m. on Saturday, July 6, and the rider covered his laps as follows: 95.7 miles, 95.4 miles, 52.7 miles, 95.4 miles, 95 miles and 62.4 miles, thus indicating that he went over the course in part six times. In order to have everything "aboveboard"

Krackowizer made arrangements for one of the F. A. M. members of the Utica club to accompany him on each lap, so that he was under the eyes of a reliable checker at all times. Prosper Jenney made the first lap out of Utica as checker; Fred Waterman accompanied the Monarch speedster on the second round; Frank Snyder and Waterman were his checkers on the third trip; Dayton Roth on the fourth lap and Abe Rizika on the fifth and sixth. Other members of the Utica club assisted with the checking and timing.

When Krackowizer finished the long grind he was covered with dust, mud and oil, the latter causing considerable trouble as it was thrown up from the freshly oiled roads, but otherwise he appeared to be in good condition. Krackowizer's record is all the more remarkable in that it was made with a single-cylinder machine against the former mark of 482 miles which was set up by a twin. The only mechanical trouble encountered was a broken oil pipe on the third lap. The Empire tires fitted to the machine came through intact.

LABOR DAY MEET.

WASHINGTON, D. C.—The next big event in the motorcycle line for this locality will be the meet at Benning track Labor Day. The Central Labor Union will be in charge of the program.

RACES were held at the Keeley Park track in Jackson, Mich., on Sunday, July 21, six events ranging from one to fifteen miles being staged.

M. C. Parrish, of Seattle.

RAIN STOPPED MEET

Big Crowd Was Disappointed When Seattle M. C. Races Were Called Off—Parrish a Winner.

SEATTLE, WASH.—A record-breaking crowd turned out for the Fourth of July race meet at Madison Park under the auspices of the Seattle Motorcycle Club. The fans were disappointed, however, as the management very wisely declared the races off on account of rain. The track had become slippery and was increasingly dangerous with each five minutes of rain.

E. L. Berrett, riding a Merkel, skidded at a curve in the three-mile open event and turned a somersault. He immediately sprang to his feet and rode a lap and a half in plucky fashion before he withdrew from the heat. In the next event, the first heat of the three-mile amateur stripped stock event, he drove his Merkel home an easy winner, with M. C. Parrish on a Merkel second, and Zwick on an Excelsior, third.

The first event, a five-mile amateur race, was won by Parrish on a Merkel, with George Brennan, Excelsior, second, and E. T. Lachall, Excelsior, third. The time of the Merkel was 6:40:5. Berrett's time in the stripped stock event was 3:51:4. In the open three-mile amateur Brant, the winner, made it in 3:34:4. Zwick, Excelsior, was second and Godfrey, Indian, third.

DENVER MEET POSTPONED.

DENVER, Col.—Rain again interfered with the Tuileries racing program on Sunday, July 21, but not until the first race was well under way. Then it came down in such quantities it was impossible to finish the program, much to the disgust to the loyal fans who had braved the threatening weather to see the speed demonstration. Although seriously handicapped by the wet track, Patterson and Bowen put up a very exciting race for first honors, with Swartz hanging on behind awaiting the first opportunity to slip past either rider for second place. Cox managed to hang on behind the trio for a while, but his eyes got so full of the mixture of smoke, oil and water, he having removed his goggles, that he was forced to slip to the rear. Result:

Three-mile open professional, 61 class—Patterson (Merkle), Bowen (Merkle), Swartz (Indian). Time, 2:12 3/4.

RACE followers turned out in large numbers to the meet staged in Winnipeg, Can., on July 1 and unusual interest was aroused because of the fact that American and English machines were matched in several of the events.

ENGLISH NOTES

BY BRITISHER

British Builders Give Serious Thought to Two-Stroke Scott, Winner of Senior Trophy—Pointers on the Douglas and Description of Handy Carrier Device.

WE are still gasping over the smashing defeat administered to the cream of our industry by the Scott two-stroke, and no doubt your riders are a little surprised to hear that the all-conquering Indian had to play second fiddle to what Tom, Dick and Harry would term a freak design. The two-stroke engine has undoubtedly made good. Its capacity was only 486cc. as against the 497cc. of the special Indian engines, the 497cc. of the Jap twins, and the 499 of the Triumph singles; yet it licked the fastest English single by 6 minutes 54 seconds, the fastest English twin by nearly 10 minutes, and the fastest American twin by 23 minutes. We may grant that the American jockeys were not quite such cracks as those who represented you in 1911, but Godfrey's winning time in 1911 was one and one-half minutes less than the victor took in 1912. I do not personally consider that the two-stroke engine (viewed in its present state of evolution) has shown any intrinsic vantage over the four-stroke.

The two Scotts were ridden by two of the best men in the race, and on jockeyship alone were bound to figure high up. Again, the chassis on which the Scott two-stroke engine is mounted shows off any engine to the best advantage. In the cant phrase of our racing men, they hug the road like a postage stamp. The open frame, composed exclusively of straight tubes, has a little central whip, which absorbs bounce; the spring forks are among the four best on the roads of the world, and reduce front wheel wobble and bounce to the absolute minimum; the frame possesses a longitudinal rigidity, which offers a taut leverage for engine drive; and all the weight is concentrated in the dead center of the wheel-base. No other machine entered possessed all these advantages in such high degree. The

Douglas: Type of Winner in Junior T. T. Race.

result was that the Scotts could swoop down rough straight stretches absolutely all out when other men were lifting their valves to correct front wheel wobbles, or bouncing about like corks, and shutting down their throttles in sheer terror; while at all the bends the Scotts swept round in smooth curves on an even keel at the absolute limit of speed, while other men were bucketting, and jumping, and swerving, and wobbling. Thus the two-stroke engine, regarded as a power unit, plain and simple, evinced equality with the four-stroke, but failed to demonstrate superiority. It is, however, questionable whether in other respects, apart from sheer speed, it did not

demonstrate its superiority. The plain man in the street, who is not a motorcyclist, plumps for the Scott every time; its smooth even running and continuous gentle purr appeal to him, when the isolated bangs of a four-stroke only repel him. Riders submit that the steady torque of a two-stroke engine is pleasanter to sit over than the smoothest gait of a four cylinder four-stroke such as the F. N., Pierce-Arrow, or Henderson.

Altogether, it is quite on the cards that our engineers have dismissed the two-stroke design too prematurely, and that it may come with a rush, and flutter the four-stroke devotees. Prior to the race the Scott factory was working double shifts, day and night, and could not deliver for four months. Add the advertisement of its T. T. victory and it is certain that unless the factory is extended, orders must be placed in 1912 for delivery by Christmas, 1913. I should add that in the race the Scott engine was not a true valveless, a gear-driven rotary valve being specially incorporated to secure the maximum nicety of operation and timing; but the tourist samples are all truly valveless.

The Winner of the Junior.

DESIGNERS who abhor the conventional and plump for originality in all things may take much comfort from our 1912 races, for the Douglas machines which swept the board in the 340cc. race were quite as freakish as the Scotts, but in a different direction. I am sending the editor a few cuts of the Douglas specialties in design, from which you will

Scott Two-Stroke Machine.

Douglas Opposed Motor.

see that it has a double-cylinder engine of the horizontally opposed type, set longitudinally in a diamond frame; and as Bashall, who steered the fastest sample to victory, scales well over 150 pounds you will guess this is a hefty power unit. Once again, I think the race flatters the winner a trifle. But for the pouring rain in the first lap, the Humber machines would certainly have hunted the Douglas home. The Humber has a V twin engine of 340cc. with desaxe (offset) cylinders, and direct belt drive from a small engine pulley to a three-speed epicyclic hub.

The small engine pulley put all the Humber down amongst the "also-rans" in their first lap, for the pouring rain and flying mud put all the belts out of court. As their engines were all racing, the jockeys got mixed up about lubrication; some overdid the oiling business, sooted up plugs, and fouled valves; others underoiled, and got their bearings somewhat parched and scrappy. In 1911 a Humber won, and its time was 9 minutes and 52 seconds faster than the Douglas did this year. However, the roads were much worse this year, especially on the first lap, when Bashall was 7 minutes slower than the 1911 winner was on his similar lap. Given a fine day, the Douglas and Humber machines would have fought out a positively terrific duel, probably with four or five representatives of each team inside a minute of each other. With a fine day next year the Junior Race should afford a stupendous contest of the ding-dong, ten-men-under-a-blanket type. However, if the two-step transmission gave the Douglas a soft win this year, it is none the less one of the best. I know its running by heart. Thanks to its transmission, you can rely on a complete absence of belt troubles, and there is no engine in the world which can do its 3,000 revolutions a minute with less fuss. The top gear ratio of the standard roadster is no higher than $5\frac{1}{2}$ to 1; on this gear I can at any time do 45 miles an hour, whatever the

condition of the engine; and if everything is dead right, I can scrap a standard $3\frac{1}{2}$ h. or 5 h. in good condition, and hold my own on all ordinary roads. It's a genuine little hopper, and it owes its excellence to the splendid efficiency of the engine balance attained by scientific application of the horizontal-opposed principle. Larger engines of the same design and make are used by the Marconi Co. for wireless telegraphy, and Mr. Douglas has just mounted one of these 8 h. water-cooled twins in a diamond frame, and is marketing it for side-car work, where it fills the bill no end.

The 1913 T. T.

I DARE say American manufacturers will hold aloof from our 1913 races, partly because they can sell as many machines as they can make on their home market, partly because it is a tough proposition nowadays to compete with the advanced British industry on its own soil; but we do hope that some of your amateur speedsters will take a European holiday next summer, and give us all a bit of a flutter. The 1913 plans are as follows: If the manufacturers' association supports the race, it will be repeated in the Isle of Man. If they again abstain, we shall have to put on our thinking caps and wait for brain waves, as we lose a lot of money over a race that has no trade entries at a hundred dollars a wheel or so. In that case, we shall probably cross the Straits of Dover, and obtain leave to race over some handy course close to the French coast. If we do that, we can expect 50 or 60 French, Dutch, German and Austrian entries, and we should get a truly international race; by the way, such a race would be worth attention from your makers, as the continental motorcycles are a sorry lot just now, barring the German N. S. U. We don't want to go to France, as they have no steep hills there, and this is such a hilly country, that a mountainous course is desirable in our interests; but I think that on the whole we shall be driven over the Channel. If we are, we shall plump for a two-day race, 400 miles in all, with machines under lock and key overnight, and only tire replacements allowed next morning. We may append two shorter races, one for 7 h. machines drawing side-cars and passengers, and the other for cyclecars, a new type of light four-wheeled carette, with an air-cooled engine not exceeding 1,000cc. weight limit of 6cwt. and price limit of \$500. Such a race week would be well worth a steamer trip, and I think I would back America to win the side-car race if she went all out; your 7 h. lines strike me as better than our native products.

A British Type of Carrier.

IN view of the recent carrier competition conducted by MOTORCYCLE ILLUSTRATED American riders may be interested in the appended cut, which shows the type of carrier fitted to most of our machines. The stand is a separate item fitted to lugs on the chainstays, and therefore capable of supporting the machine when the back wheel is removed to change a cover. The carrier is formed of stout tubing with brazed joints, and flat crossbar; it is sufficiently strong to carry a passenger seated on a cushion, and is so centered that the weight is all carried vertically, and concentrates on a lug brazed to the rear forks. This enables a single bolt to hold the carrier and its contents to the rear fork bridge, just below the

saddle, and when a complex tire repair is in progress, this bolt is pulled out, and the carrier dropped backwards on to the road, thus leaving the top arc of the tire accessible for the repairs, which can now be attempted without the rider getting a kink in his vertebrae. The standard equipment consists of two small pannier toolbags, long and narrow, attached to the side tubes of the carrier by short belts, held by D nuts against bent steel plates, a mode of attachment that cannot under any circumstances vibrate loose. The heavy tourist further attaches a large kitbag to the top of the carrier, and in extreme cases, a pair of large V pannier bags are also bolted to the sidelegs.

MAKING A PIERCE FRAME.

AN unusually interesting view in the frame department of the Pierce Cycle Company's factory at Buffalo is given in the accom-

panying photograph. It shows a Pierce expert at work on a frame for one of the company's single-cylinder models. Attention is called to the strength of the flange construction; the rivet heads may be plainly seen.

REX SPARK PLUG.

AN improved spark plug, manufactured by the Rex Ignition Manufacturing Company, of 1779 Broadway, New York City,

which has been on the market for the last two months is rapidly coming into favor with motorcyclists and the makers already find it one of their most satisfactory sellers. It has double insulation, and being absolutely soot-proof it cannot short circuit. The wire used in this plug is of the imported "meteor" brand which is guaranteed against burning out. The Rex plug is supplied with a combination top nut which may be used on any make of machine.

FOREST RANGERS in Porterville, Cal. are hereafter to patrol their ranges on motorcycles instead of ponies. With the motorcycle the ranger will be enabled to cover between 150 and 200 miles a day while 50 miles daily was his best average on the pony.

An English Detachable Carrier.

HOW APPLEBEE WON SENIOR TROPHY

Ability of His Scott to Hold the Road Gave Him Small Lead Over Haswell—Variable Gears Proved Their Value—Dissatisfaction Over Manufacturers' Agreement.

ENGLAND has recovered the handsome silver Tourist Trophy, which the Indian machines carried off to their bungalow in such convincing fashion last summer. At the last moment Oliver C. Godfrey, last year's winner, scratched from the race, partly because his nerve is weakened by a taxicab smash, partly because he is troubled by litigation over his tire retainers; and as Moorhouse (second in 1911) is dead, and DeRosier is in a hospital, the Indian team was distinctly weaker, and of the four machines to start, three secured the eighth, tenth and thirteenth placings, while C. B. Franklin, when riding fourth was stopped by the judges. He had a very nasty toss while crossing Snaefell mountain, and passed the grandstand with his oval front wheel lopping round eggily, and his bent forks inducing a permanent sway; the management decided that he was a danger to himself and the others, so much to his dudgeon they flagged him off the course.

Nevertheless the Indian defeat must not be taken too seriously. Two or three English firms have had a monopoly of racing success for many years past, and the disappointed rivals forced a bond on the manufacturers' association last winter, binding the signatories to abstain from the 1912 race. As a consequence the Hendee factory took no part in this race, the four Indian machines being entered by private individuals. The capacity allowed for twins was cut down by 85cc. and though last year's special racing machines were used, they were not sent to the Hendee people to be altered. Godfrey and Applebee of London (Eng.) hauled them up from the basement where they had reposed all winter, and cut down the connecting rods. This shortening of the stroke necessitated other modifications, *e. g.*, new cam contours, new valve areas, new flywheels, new timing, etc., and the slower speed of the altered Indians, as compared with that of the rivals they beat last year, shows that the work has not been properly done. At all events the Indians never looked like winning, neither did the famous brothers, Collier, who have always run high up in this race since its inception.

From the very first lap three men stood out from the crowd. One was an amateur, Haswell, who is a farmer near Rugby, and was using the same machine on which he did 63 miles in the hour on Brooklands track. He rode like a demon, and was easily faster than all the four-stroke twins; indeed his engine is probably the fastest $3\frac{1}{2}$ h. single that ever left a factory, but he was handicapped in the race by two factors. He obviously could not hold his machine straight on the downhill stretches where speeds of 70 and perhaps 80 m. p. h. were indulged in, and he could be heard cutting out where others were doing 3,000 revolutions a minute; and secondly, he began to hit the ground with his footrests at the many bad corners. Such low rests were an error of judgment, excusable only by the fact that wet weather during the practice week had made lurid corner-work perilous. However, there were two machines in the race that were even faster, the pair of two-stroke chain-driven twin Scotts, ridden by Philipp and Applebee. These two machines were possibly

no speedier than Haswell's on a straightaway track, but they have a marvelous knack of steady riding. They can be leaned over at a bend far more horizontally than any other machine on our market, and on rough stretches they stick to the road like a postage stamp, where other machines bounce and wobble. As a good deal of the road was vile to a degree, the Scotts were able to keep going all out where others slowed down. Probably their open frames give a little at the center, and take off bounce, while they carry both engine and tanks and gear-box, piled together in the center of the wheel-base, and so get a low center of gravity. At any rate they soon drew well out from all the four-stroke crowd, and if Philipp had not burst a tire on his last lap, they would have soundly thrashed the entire entry.

Behind this trio the two Colliers were running steadily and well, but were too slow to win, and dropped a minute or two apiece with stops due to overhead valve springs. When Franklin was out of the way, owing to his fall in trying to catch up to the Scotts, the Indian team had no class jockey left, and three more Triumphs showed the speediest Indian the way home. After the race Billy Wells, the Hendee company's London manager, said grimly, "No more bonds for us," and it may be taken for granted that the Indian wigwam will itself superintend preparations for the 1913 race; its riders this year were not factory representatives, and received no factory aid.

The race was not remarkable for incidents. A record was set up in that all the 41 starters managed to complete the first lap. Hugh Mason's machine caught fire at a replenishment depot when he was riding fourth, but was extinguished with sand; riding on he got in a rut crossing the mountain at 75 m. p. h., wrenched his front tire off, was flung over his handlebars into the heather, and picked up winded but otherwise unhurt. Three of the 340cc. machines from the Junior Race of the previous Friday completed against their big sisters; one fell out, but the other two finished fifteenth and seventeenth, thus defeating more than half the entry. These tiny Douglas machines are tremendous goers, but would have no chance on a straight road or a track. They scored by their nippiness round the corners, and indeed might have won if there had been no mountain in the race. Of course, with their small engines they were slow up the five-mile climb. None of the water-cooled four-stroke engines did any good; the race proved that air cooling is good enough on a road where the gradients prevent a very high compression being used. All the machines had variable gears, and the crack riders used them at every bad corner; the average top ratio was about 4 to 1, and a 6 to 1 ratio would be snickered at a cutting-out bend, so that the machine would accelerate again with a roar. Those who used three-speed hubs disconnected the bottom ratio, and ran on top and normal. The Scotts use a countershaft two-speed gear with friction clutches.

Tires gave a great deal of trouble, largely ascribable to scraping at the corners; genuine punctures were rare. Fortunately for the belt-driven machines the day was fine and dry,

otherwise the Scotts and Indians (chain drive) and the Douglas (combined belt and chain) would have had the finish to themselves. In all probability next year's race will be a two-day affair, planned to further test reliability, and the distance may be increased to 400 miles. Whether the Isle of Man will be the venue or not, is uncertain; the race is very expensive, and it is known that fifty or sixty continental entries could easily be secured if a French course were adopted. On the other hand the inclusion of a really bad hill is regarded as essential, otherwise variable gears will not be fitted, and the variable gear is in the forefront of development over here. In any case the American machines which compete next year will be up against a tough proposition, and may very likely have to face a truly international entry, as motorcycling is fast reviving in France, by infection from the English industry. We should like to see a few more machines as well as the Indian.

The race was run over a course of 187 miles, five laps of 37 miles each. There were many bad corners and Snaefell mountain necessitated a climb over poor roads of 3,500 feet. The winner's average speed was 48.69 miles an hour. The race was limited to machines not exceeding 500cc. The order of finishing was as follows:

VISITOR FROM CALIFORNIA.

AFTER visiting the Pope Manufacturing Company's plant at Westfield, Mass., and conferring with the management there and at the executive offices in Hartford, Conn., regarding their plans for the immediate future, C. L. Smith, of Los Angeles, known throughout Southern California as one of the largest, best posted, and most progressive motorcycle dealers in the State, has just closed a large contract with the company for 1913, having decided to confine his efforts during the coming year to the exclusive sale of Pope motorcycles.

INCREASED FACILITIES.

THE Standard Roller Bearing Company, Philadelphia, Pa., has found it impossible to keep up with its orders and has been compelled to increase its facilities by the purchase and installation of over \$100,000 worth of additional machinery.

THE Edwards Cycle Company, 119 Sixth street S., Minneapolis, Minn., has added the Marvel motorcycle to their line.

AT Alameda, Cal., July 4th, Jno. J. Swanson, riding a regular stock 7-8 H.P. Harley-Davidson twin with another passenger on the tandem, won the twin cylinder economy test by covering 5 miles on $9\frac{1}{4}$ ounces of gasoline. This is at the rate of 69.2 miles per gallon.

A WORLD'S RECORD

The twin Harley-Davidson with two passengers used less gasoline than did the single cylinder machine of another make with no tandem and only one rider, which won the single cylinder event in which no Harley-Davidson was entered.

For more than four years the Harley-Davidson has held the world's official economy record in spite of repeated concerted attempts of other manufacturers to break it. This latest victory at Alameda is not a surprise to us or to our riders and dealers. Everyone acquainted with the motorcycle trade knows full well that Harley-Davidson stock machines are, and always have been, the most economical motorcycles to operate by a wide margin.

HARLEY-DAVIDSON MOTOR CO.

QUESTIONS and ANSWERS

IN keeping with the announcement made in the June 27 issue, introducing the first of a series of mechanical queries to be answered by motorcyclists, the Editor of the Questions and Answers Department presents below the most concise and accurate letters describing the "general design and operation of a carbureter." While definitions have been plentiful and always indicative of a working knowledge of the standard carbureter on the part of the writer, few of them have been clear or complete. Deficiency in one or the other of these qualities has barred a number of otherwise interesting letters from riders who knew their subject but failed to make the most of their descriptions.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be

awarded to the two readers whose replies are most thoroughly characterized by clearness, accuracy and brevity. A new question will appear in each issue. Answers will be published the second issue following the number in which each question is asked. For example, answers to the question originally published in the June 27 issue, and repeated below, will be printed in the issue of July 25. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York."

Question No. 2.—Describe, so that a novice will understand, the construction and functions of a spark plug. Answers to this question will be published in the August 8th issue.

FRANK

MERRITT

IN preparing their definitions not a few writers erred on the side of verbosity, giving a lengthy description which, while basically correct, would not convey a clear idea to the mind of a novice possessing little or no previous knowledge of the mixing device. The aim should be to give a full statement in the fewest words and the simplest language. In the opinion of the editor these requirements were most satisfactorily met by P. Lindemann, of 1487 Hoe avenue, Bronx, N. Y., and he has been awarded the first prize of five dollars. K. G. Evans, of 111 East Washington street, Elkhart, Ind., receives the second prize of three dollars.

Mr. Lindemann defined a carbureter and outlined its functions as follows:

The gas giving energy to a motor must be in a state of vaporization and also mixed with a certain quantity of air. These functions are performed by the carbureter or vaporizer, as it is also called. Generally speaking, the carbureter consists of two parts, the float chamber and the mixing chamber. The suction of the piston draws the gasoline, in the form of a fine spray, through a jet in the float chamber into the mixing chamber, where the auxiliary air is mixed with the gas vapor. This mixture is explosive and enters the cylinder.

The auxiliary air is admitted through an automatic valve or through a hand-operated shutter. The float is of shellaced cork or a hollow cylindrical ring surrounding the float chamber which, by floating on the gasoline, regulates the amount entering the carbureter from the tank, through opening and closing a needle valve.

QUESTION No. 1.

Define, briefly and accurately, the general design and operation of a carbureter.

The definition submitted by K. G. Evans is as follows:

The carbureter is the device which vaporizes the gasoline and mixes it with air to form an explosive vapor or gas. This mixture will produce power like gunpowder when compressed into a small space. While there are several forms of carbureters the main principle of action is the same in all. Gasoline reaches the carbureter through the feed-pipe by gravity, passing into the float chamber. As it enters, the float rises until the proper amount has been received, when the supply is cut off. The gasoline is then forced through a spraying nozzle into the mixing chamber where it is vaporized with the air that comes from the air intake valve, located at the top of most carbureters. The gas is now explosive and passes through the throttle valve to the cylinder to furnish power.

The following description, submitted by Charles C. Bott, of 3231 Washington avenue, St. Louis, Mo., is considered worthy of publication:

A carbureter is a cylindrical bowl containing a cork or metal float to regulate the height of the gasoline and the supply of the same to a spray nozzle. This float is either semi-circular or circular and its rise or fall operates a needle valve which controls the flow of the liquid.

The gas being formed by the mixture of air and the gasoline which escapes through the spray nozzle, is carried into the cylinder of the engine by the suction of the down stroke of the piston.

J. H. Wood, of Sibley, Mich., forwarded this definition, also regarded as worthy of consideration:

A carbureter, as used on motorcycles, is an appliance for atomizing gasoline and mixing it with air in proportions to form an explosive mixture. The main parts of a carbureter are the float chamber, spray chamber, and the mixing chamber.

The float chamber contains the float which operates a valve in the supply line and maintains a gasoline level at or near the top of the spray nozzle. The spray chamber, which is also the main air intake passage, contains the spray nozzle out of which the gasoline is sprayed by the suction of the engine.

The mixing chamber is an enlarged passage above the spray chamber and contains the auxiliary air valve. The gasoline and air drawn up from the spray chamber are here mixed with air drawn through the auxiliary air valve. This mixture is then ready to be taken into the engine.

MEASURING HORSEPOWER.

J. W. BUTLER.—While in general a motor with piston displacement superior to that of another motor will give off more horsepower, this is not invariably the case. The motor with smaller cylinder volume may have higher compression pressure and be designed to run at a higher speed than the other, so that

The Economy of Gargoyle Mobiloils

Lubricating oils "break-up" and thin out in use. In plain terms, they wear out. The better the oil the longer it wears.

In sheer wearing-qualities, Gargoyle Mobiloils stand alone.

Further:

Different types of motor demand different grades of oil. In Gargoyle Mobiloils we give you the one grade of oil best suited to your motor.

This increases power and further reduces the consumption of oil. It minimizes wear on the moving parts.

The life of your motorcycle depends on the reduction of friction. Is it not worth your while to insist on the oil that will reduce friction most effectively and most economically?

In price, Gargoyle Mobiloils are somewhat higher than ordinary motorcycle lubricants. But—

The cost per mile is low.

Gargoyle Mobiloils are the products of our experience as the world-wide leaders in lubrication.

In them we have set a new standard for motorcycle lubricants.

Gargoyle Mobiloils are put up in barrels, half-barrels, in 5 and 1-gallon sealed white cans.

All are branded with the Gargoyle, which is our mark of manufacture. They are handled by the higher class garages, auto supply stores and others who supply lubricants.

The various grades are named:

Gargoyle Mobiloil "A"

Gargoyle Mobiloil "B"

Gargoyle Mobiloil "Arctic"

You will find the correct grade of oil for your motorcycle in our list of recommendations—printed on the right.

VACUUM OIL COMPANY

Rochester, N. Y.

GENERAL SALES OFFICES, 29 BROADWAY, NEW YORK CITY
DISTRIBUTING WAREHOUSES IN THE PRINCIPAL CITIES OF THE WORLD.

This list shows the right oil for your motorcycle.

Explanation: In this schedule the letter opposite the name of motorcycle indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." Recommendations cover all types of the same make unless otherwise stated.

the power output would be greater in spite of the difference in piston displacement. Again, of two motors of equal bore, stroke and piston displacement but different compression pressure, that with the higher compression pressure would probably give off the greater power and be the faster motor of the two. Examples of this will be seen in the "stock" and racing models of various makes of motorcycles, where the racers (with the higher compression pressures) give off more power and run at higher speeds than the "stock" motors. Of course the lightening of the moving parts makes for a good part of the increase in speed, in addition.

The measuring of motors by piston displacement and examination of the parts for drilling is good as far as it goes. But with an increase in compression pressure an increase in speed is generally attained, hence neglecting this important factor would enable a smart rider or mechanic to enter a high compression machine in a contest and remain smilingly confident that the motor would be declared "stock" on the measurement of its piston displacement only. There are a number of methods of determining the compression pressure; one is by the use of a gauge graduated to suit and fitted with connections to go in the spark-plug aperture. Another is:

Take a measured quantity of snipe or other small shot and find the weight per ounce and per cubic inch. Place the whole quantity of shot in a can, weigh the can and shot, and removing the valve cap or dome pour in shot until the combustion chamber is full. The motor must be on compression dead center, so that no valves are open before this is done. Stir the shot about in the chamber with a small rod. Now weigh the can with the remaining shot. The difference between the weight before filling the chamber and after filling the chamber will give the weight of shot used, and as the weight per cubic inch of shot is known, the cubical contents of the chamber will be found. To get the compression ratio use this formula:

$$\frac{P+p}{p} = r, \text{ when } P \text{ is the piston displacement, } p \text{ the volume of the combustion chamber and } r \text{ the ratio.}$$

The ratio having been found, multiply by 14.7 pounds, obtaining the compression pressure.

Example; $P = 30$ cubic inches, $p = 5.5$ cubic inches. Then $r = 30$ plus 5.5 divided by 5.5, or 6.45. Multiplying this by 14.7 we get 94.81 pounds compression pressure. The example is taken arbitrarily; practically no air-cooled motor would have such a high pressure, as pre-ignition would soon occur at such figures.

TIRES AND GEARS.

R. C. DALLEY.—(1) A chain will prevent skidding on practically all kinds of slippery surfaces, hence its use is desirable, especially when the rear tire has its tread (with studs, etc.) worn or is a smooth tread tire. (2) The larger the tire on any motor vehicle the greater the economy, as the load carried by the big tire is less in proportion to its maximum load than is the case with the smaller tire. That is, if a tire is designed to sustain the load of a 200-pound machine and 200 pounds of load are put on it, it will wear out in a given time; whereas, if the tire used is for a 300-pound machine, the tire will last very much longer under the 200 pound load. Again, the casing being heavier and thicker, puncturing will be less likely. The first cost

of the larger tire will be greater, but the final cost will be less and should repay the purchaser in fitting the larger tire.

(3) There is at present no hub variable gear device on the American market, and we do not know where one for a 7 h. machine can be obtained. Write the Armstrong Three Speed Gear Works, Icknield street, Birmingham, England, or the Sturmey-Archer Gears, Ltd., Nottingham, England. Write for prices, etc., these firms make hub gear devices, but we doubt if they make any for machines as powerful as 6 or 7 horsepower.

A FAMILY MACHINE.

GUY PECK, of Los Angeles, Cal., argues that his wife and the kiddies are entitled to a share in the enjoyment he derives from his Excelsior 6, and as a result he has

worked out a system by which the whole family is accommodated on the machine. Peck states that trips are made almost daily to points in and near the city, and that every fine Sunday finds him piloting his heavily laden machine into the country for a picnic. On more than one occasion of late sixty miles have been covered in a day without difficulty.

THEY USE THE JONES.

G. L. HOLMES, general manager of the Jones Speedometer is elated over the receipt of a letter from Captain A. J. Stiles of the Chicago police department to the effect that he has tried various makes of speedometers in order to determine which is the

most accurate and that he has chosen the Jones. The captain further informs Mr. Holmes that he has equipped his motorcycle squad with Jones speedometers.

The police departments of many of the larger cities in America and Europe use Jones speedometers.

MAGNETO CUT-OUT.

W. DROEGE.—Using the cut-out simply short-circuits the primary windings of the magneto and the armature will be rotated

idly (that is, without generating high-tension current). It is not likely to damage the magneto if used with discretion, and in a great majority of cases no matter what the amount of usage. There are a number of instances where magnetos fitted with cut-outs have been used on racing motors for nearly a year without apparently affecting the machine in regard to current output, etc. Of course it depends on the magneto and the workmanship entering into it as to how long it will last.

MOTOR SUSPENSION.

K. E. EVANS.—You would be very rash to attempt to support a motor by the cylinders alone. The result of such suspension would be the tearing away of the crankcase and its contents, with possible damage to the rider. Cylinders are made of cast iron, while the crankcase is made of aluminum or an aluminum alloy that is strong enough to take care of all shocks due to the explosions in the cylinders, something that the cylinders are not capable of unless supported by the crankcase. By supporting the motor by the cylinders you would depend on four or more bolts only, whereas you now have a big bearing surface on a stout crankcase to take the thrust of the connecting rods, etc. Cylinders are only attached to the frame to prevent lateral motion of the motor, it having been found that in many frames the bearers on the crankcase were not sufficient to prevent side-wise rocking of the motor.

TWO-SPEED GEAR QUERY.

A READER, California.—There is no two-speed device on the market, nor as far as we can find out in existence for a flat-belt machine. The belt two- and three-speed gears are made for V-belt only and are practically all European-built. The flat belt is not used abroad at all; the V-belt is used in the majority of cases, and the chain in all but two (F. N. and T. M. C.), which use the shaft. The N. S. U. device is for V-belt only. There seems to be no reason for thinking that such a device, when used with either a V- or flat belt, would overheat the motor at all. If you desire a two-speed device at present, you will probably have to transform your mount to a V-belt or chain machine.

CLASSING 30.50 TWINS.

NEW YORK SUBSCRIBER.—There is no specification in the present Competition Rules against the use of a 30.50 cubic inch twin in contests where the limit is 30.50 cubic inches. There are no twins of this displacement made in this country at present, as far as we know. The subscription to the *Motor Cycle* is \$2.50, and is best obtained through the International News Co., 85 Duane street, New York City.

ILLINOIS AND MISSOURI LICENSES.

PAUL AMBUEHL.—For an Illinois license write the Secretary of State, at Springfield. The fee is \$2. For Missouri riding you can use your Illinois license and get exemption as a non-resident for a period of 20 days per year. See the *MOTORCYCLE MANUAL*, pages 46 and 48, for further information.

MINERVA PARTS.

J. G. CLARK.—The Minerva motorcycle is of Belgian manufacture and is made at Herstal-Lez-Liege, Belgium. The firm's name is Minerva Motors, Ltd. To the best of our knowledge there are no American agents. Parts can sometimes be obtained from Campani & Cocchi, 2142 Broadway, New York.

SEARCHLIGHT No. 103, showing back closed.

20th Century Searchlights are renowned for their great light giving qualities. Their patented construction, similar to the big naval searchlights, is designed to throw a most powerful ray directly in front, quickly revealing any object of danger a long way ahead in the rider's path.

With the 20th Century generator these lamps are unequalled in points of efficiency, serviceableness, and appearance.

The "open-door-to-the-lens" feature, permitting easy cleaning of the lens, affords another great advantage.

Be assured; if it's a 20th Century it's made of the right stuff and by the right substitutes.

The Combined Lamp and Generator No. 6 is especially appreciated by those who desire the extreme of compactness. It is one of the handsomest lamps we make and has made many friends among the trade and riders.

The necessary bother of tanks, etc., is eliminated by the use of this lamp and the cost of maintenance correspondingly reduced.

Get your dealer to show them to you or write us for complete catalogue and prices.

Century it's made of the manufacturers. Take no

P.E.M. LEADS THEM ALL!

In every race meet in which the P.E.M. has been entered this year, its first season, this wonderful motorcycle has captured the big end of the first and second places. Just read this record—Deeds talk louder than claims.

JANESVILLE, WISC. — Big Decoration Day Meet. Six events; The P.E.M. took four firsts. In event 5, A P.E.M. "single" won by over 13 seconds a 10-mile race against a field of "twins."

MILWAUKEE, WISC., June 8th—The P.E.M. took first in novice, first in Private Owner and Second for Stock Machines (In this latter event the winner was a stripped machine with a trade rider).

OSHKOSH, WISC., June 9th—In Six events on a half mile track P.E.M. won five firsts and two seconds.

There is a reason for this regular consistent winning—and that is the superiority of the P.E.M.—Easy riding on bad tracks because of the "leaf-spring" hung frame.

High powered Engine because of high compression due to overhead valve mechanism. Positive chain drive with free engine clutch.

If you want to be a winner on the track or on the road—you must ride a P.E.M. Write today for booklet and special rider agency offer.

WAVERLEY MFG. CO., Waverley Place, JEFFERSON, WIS.

THE "MILITAIRE" is built in *anticipation* of the logical evolution of the motorcycle. It is the result of keen study of traffic and other conditions in this country, and we unhesitatingly affirm that the "MILITAIRE" is better fitted to cope with road conditions than any other motorcycle on the market. It is radical, we admit, but so was Fulton's steamboat, and Marconi's wireless, and Westinghouse's brake.

CHICAGO PICNIC.

ONE of the most pleasant features of the first annual picnic and field day of the Chicago Motorcycle Club, held on June 29, was the interest manifested by the women riders of the city. Many of them accompanied the club as

tandem passengers and a few piloted their own machines. Over 150 enthusiasts participated in the program.

JOTTINGS FROM SAVANNAH.

SAVANNAH, GA.—There are indications that the long talked of road races under the auspices of the Savannah M. C. will be held on Labor Day. It is the intention to hold two events, for singles and twins, of 100 miles each.

The clubs in Augusta and Columbus, Ga., have suggested plans for a reunion with the Savannah boys to be held in August or early in September. The three clubs will ride to some town which may be reached over good roads and there enjoy a dinner and a program of games and contests.

Sales of motorcycles to be used for commercial purposes have recently received a boom in Savannah. The Pigman Pharmacy has purchased an Excelsior, the Knight Drug Co. is operating an Indian, the Savannah Lumber Co. uses an Excelsior and the Sykes Drug Co. is making deliveries with a Harley-Davidson.

TRENTON ENDURANCE RUN.

TRENTON, N. J.—The Central Jersey Motorcycle Club at its last regular meeting completed arrangements for a 200-mile endurance run to be held August 11. This event will be the first of its kind for the club. The route will be from Trenton to Pennington, to Ringoes, to Flemington, to White House, to Clinton, to Washington, to Beattystown, to German Valley, to Morristown, to Chatham, to Springfield, to Newark, and then back to Trenton via Elizabeth, New Brunswick, Old Bridge, Matawan, Freehold, Hightstown, Cranbury, Dayton, Monmouth Junction. The entry fee is one dollar. A number of attractive prizes will be awarded. The start will be made at 7 a. m. at the new reservoir in Trenton. An average speed of 20 miles an hour will be maintained.

GOING TO ATLANTIC CITY.

AT the last meeting of the Reading (Pa.) M. C. plans were laid for a run to Atlantic City, N. J., to be held August 10-11. The riders will leave the clubrooms at 1 p. m. on Saturday and return on Sunday evening. On Sunday, July 21, a number of the Reading riders went to Pottstown to practice on the track in preparation for the races to be held there on August 3.

DIRECTORS OF C. M. A.

DIRECTORS of the recently organized Canadian Motorcyclists' Association which is making rapid progress in the rounding up of riders throughout the Dominion. In the top row from left to right are W. J. Cunningham, vice-president; Kenneth R. Spencer, president; Thomas I. Anderson, secretary-treasurer; Alex. McLain and Nelson Chambers. Those sitting, from left to right, are W. G. Tite, Fred Johnson, chairman of the Competition Committee; B. Wilhelm, William Gladish, T. Thornwaite and Jack Scott.

TANDEM DEMONSTRATIONS.

WITH a view to convincing the city officials of Washington, D. C., that the ordinance prohibiting the carrying of a woman passenger on a motorcycle is unreasonable, the National Capital Motorcycle Club is conducting a series of tests and exhibitions, using a Simplex spring tandem attachment. The club aims to demonstrate on a practical basis that no danger need attend the carrying of a passenger on a well-made tandem attachment, and there are indications that the objectionable ordinance will be revised.

There is no motorcycle on the market today that is so absolutely perfect in essential details as the R-S. There is no motorcycle on the market today that can successfully compete with the R-S in point of speed, durability and comfort.

We challenge a repudiation of this statement by any

manufacturer, dealer, jobber or rider. We do not make racing machines, but we will put up any stock machine made by us against stock machine of any other make. We are seriously, solemnly and desperately in earnest about this and want to hear from anyone who thinks he has a machine of stock design that can "put one over" on the R-S.

4 H. P. ROADSTER.

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of June 13 is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I am planning to take a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and I am looking forward to a very pleasant trip.

Yours very truly,

B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waking & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,
CHAS. A. TAYLOR.

FIRST QUALITY GUARANTEED MOTORCYCLE CASINGS REDUCED

As is generally known in the automobile trade the policy of the U. S. Tire Co. is to eliminate all the old brands such as "Hartford," "G. & J." and "Morgan and Wright" and concentrate under a single brand—"U. S." The makers have decided to follow the same plan in marketing their Motorcycle Tires and so sold us all their new casings branded "Morgan & Wright," made for sale this year and backed with their usual liberal guarantee.

1912 Morgan & Wright Brand, U. S. Tire Co. Make

Single Clinch—Guaranteed		
Size, Inches	Basket or Corrugated	Bailey or Tourist
26 x 2 1/4	\$6.55	\$6.80
26 x 2 1/2	7.00	7.25
28 x 2	6.40	6.65
28 x 2 1/4	7.05	7.30
28 x 2 1/2	7.50	

Double Clinch—Guaranteed		
Size, Inches	Basket or Corrugated	Bailey or Tourist
26 x 2 1/4	\$6.80	\$7.05
26 x 2 1/2	7.25	7.50
28 x 2	6.65	6.90
28 x 2 1/4	7.30	7.55
Note—2 1/4 in. size fit 2 1/2 in. rims.		

Backed by the Guarantee of the Largest Makers in America

While our price is low, the guarantee is just as liberal as if you had paid the full price. Make claims (if any) direct to the U. S. Tire Co. in New York or any of its branch offices, which are located in every large city in the United States. Ask for prices on Racing Weight Casings.

"We use thousands of Diamond Chains with absolute satisfaction and believe they are the best made in this country."

That's what the Consolidated Mfg. Co., of Toledo, large manufacturers of bicycles and motorcycles, have to say of Diamond Chains and they know from long experience.

Diamond Chains are and have for 21 years been the recognized standard and have been adopted as such by bicycle makers whose product is of the highest grade. Doesn't this warrant a trial on your part? See that the Diamond trade mark appears on the connecting link when you buy a new chain.

PIERCE SINGLE CYLINDER Wins Another Victory

Following letter received from F. A. Baker & Co., New York agents for Pierce motorcycles.

June 24, 1912.

The Pierce Cycle Co., Buffalo, N. Y.

Gentlemen:

"We wish to advise you that one of our riders yesterday went through the 200-mile Endurance Run of the North Jersey Motorcycle Club.

The rider says: 'I made them all sit up and take notice, for my Single would pass even the 7 h. p. twins.' He completed the entire distance without a single mechanical adjustment."

Ask for catalog and agency proposition. Immediate Deliveries.

House Orders.

Each order is to be filled before six o'clock or shippers must work over time. We return the money, on any article sent back, at our expense, if not entirely satisfactory, shipments must therefore be correct.

If you want to please me - please our customers.

C. L. Waters, Mgr.

A manufacturer's salesman passing through our warehouse saw the blackboard on which we write the rules that govern the working of our shippers. He said—"If every Motorcyclist were to walk through here and see that board, a whole train would not hold enough supplies to fill their orders. Won't you let me take a photo of it to show the boys why your sales are increasing so fast." ABOVE IS THE BLACKBOARD.

Our big catalog of all-guaranteed supplies is free.—Write for it today.

MOTORCYCLE EQUIPMENT CO., Hammondsport, N. Y.

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

THE BAXTER SIDE-CAR

**The Strongest, Lightest
Most Comfortable Side-Car
in the World**

Ten years of side-car manufacturing experience has qualified us to state authoritatively that the Baxter side-car is fit to cope with any and all road conditions in America.

Its chassis of seamless steel tubing, double truss frame construction and rigid mudguard give it enormous stability.

Yet so scientifically is the weight distributed that it is the lightest frame on the market. Then, too, the hub spindles, the most vulnerable point on a side-car, are turned from solid Bessemer steel.

Comfort is assured by its tension spring absolutely absorbing all shocks, its deeply upholstered basket of India rattan and its popular English shape.

Note.—We make baskets to specifications. All parts quick-detachable and furnished separately if desired.

The Neverout
TRADE MARK

**Gas Lighting
Outfit**

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles implored us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Before

After

**J-D Visible
Cured
This Man**

DIAGNOSIS—Ignition Trouble

**PRESCRIPTION—One set J-D Visible
Spark Plugs**

**FEE—\$1.00 per plug—money back if
not absolutely satisfied**

We can cure your ignition troubles, too. The new principle embodied in the J-D VISIBLE GAP SPARK PLUG enables you to locate and cure ignition trouble at a single glance.

One look tells everything

Through the port in the porcelain—outside the motor—you see if the spark is jumping the gap in the central electrode. If the spark jumps, but proper ignition fails to follow, then the plug must be foul or the carburetion faulty. If the spark does not jump, then trouble lies behind in magneto or wiring or coil or batteries. Knurled adjusting nut allows you to widen or close gap. Opened, it intensifies spark and cleans point automatically. Uses minimum current, makes timing of engine easy, and permits regulating of spark in any cylinder.

If your dealer has not yet put the J-D VISIBLE PLUG in stock, we will mail you as many as you want, guaranteed, prepaid on receipt of price—just \$1.00 per plug. Write and tell us the size wanted and make of motor.

When Selecting a Horn
Do you buy for cheapness or efficiency?

THE ACME SIREN

Costs a little more than the ordinary bulb tooter, at the start, but on account of its simple and strong construction will outlast two of them. Nothing to get out of order. Made of heavily nicked brass. For efficiency as a warning signal, it cannot be equaled. A slight bulb pressure is enough to produce a loud, penetrating warning with great carrying power.

Look for "Acme" nameplate on horn Sarco Engineering Co., New York Send for Catalogue

When writing to advertisers, please mention **MOTORCYCLE ILLUSTRATED**.

In driving your motorcycle,—with the grip control, the idler and clutch,—your hands or the gloves that cover them stand all the wear and tear.

It's easy enough to spare your hands by wearing gloves,—and it's just as easy to wear gloves that not only spare your hands, but also spare your patience and your purse,—that in every way are suited to your needs.

Grinnell Grip-Tite Gloves for Motorcycling

are made of the highest grade of velvet colt skin,—are guaranteed not to crack, peel, or harden from usage,—they are made to stand the hardest service. They have a double thumb and double corrugated palm, which makes easy a firm, sure grip,—relieves your hands of cramp and strain. When at last this re-inforcement wears out, it can be ripped off, still leaving a practically new pair of gloves. "Grip-Tite" Gloves can always be washed in soap and water or gasoline, and still remain so pliable that, with them on, your hands are free to make every needed adjustment or repair.

And wear isn't the only advantage of "Grip-Tite" Gloves. The ventilated back admits a constant current of air,—means cool, comfortable hands.

Grinnell "Grip-Tite" Gloves, with their exceptional wear and many other qualities, are just the thing for the motorcyclist. Ask your dealer to show you a pair, or write for our circular describing "Grip-Tite" Gloves.

A REVOLUTION IN MOTORCYCLE MOTOR DESIGN

In bringing out our DE LUXE line of motorcycle motors, we have introduced a large number of improvements, and offer these motors as the most advanced now before the trade.

NOTEWORTHY IMPROVEMENTS.

One-piece crank shaft.
One-part crank case with cover.
Improved cam and magneto drive.
Oil tight motor.
Large Valves.
Simplified design throughout.
Reduced number of parts.
Silent Motor.
Large ball bearings mounted in steel lined pockets.
Equipped with Bosch Magneto.

These improvements in design, together with the high grade materials used in construction, the modern methods of manufacturing applied, and the remarkable performance of these motors in road tests mark a revolution in motorcycle motor building.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS

THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

TRINITY CHIMES

An Exhaust Horn with a Musical Tone
Warns Without Giving Offense
A Hair-Raiser When Needed

There is absolutely nothing about the Trinity Chimes to get out of order—no moving parts, no batteries, no wire connections. It never fails. It costs nothing to operate. It is operated by a three-way valve which is supplied with the horn. Its four tubes give a perfectly blended chord of pleasing harmony. Its body is a brass casting. The tubes are brass-wedged into slots in the casting, and instead of being of flimsy construction and supported separately, they are carefully brazed together, building up a unit of such strong construction as will last a lifetime. It is furnished in triple nickel-plate, highly polished.

Get the best horn at a lower price; don't spend more for one not so good.

POPE—ANNOUN

NEW POPE "BIG 4" READY

Has many original features and all that is latest and best

POWERFUL SPEEDY RELIABLE

Pope Big 4. Model K. Price, With Imported Magneto, Eclipse Free Engine Clutch—\$200

Motor—Big 4 h. p.
Offset Cylinder.
Mechanically Operated Valves
in Center of Cylinder Head.

Low Center of Gravity.
Improved Spring Fork.
Clutch and Idler operated by one
lever.

Imported Magneto.
56-inch Wheel Base.
28-inch Wheels.

Model K carries out in a motorcycle of greater size and power the same liberal policies inaugurated by the production of the Pope, Model H.

In Quality, Price and Performance the Pope "Big 4" is in every way qualified to duplicate in its particular field the great popular success of Model H.

The Pope "Big 4" is just what its name implies—a big four-horsepower machine built to give the most exacting riders everything they want in the way of reserve power, speed and reliability.

With all that is latest and best in construction and design, it combines a number of new and exclusive features, the desirability of which has been demonstrated conclusively. All modern conveniences are included in the regular equipment.

DEALERS! ORDER YOUR SAMPLE MACHINE TODAY; GIVE IT A GOOD TRY-OUT; THEN GET IN LINE FOR THE FALL TRADE. There is an immense field for the Pope "Big 4." You'll find it unquestionably the best all-round motorcycle ever offered at anywhere near the price. If there is no Pope dealer in your town, write us today. Send for Catalog No. 70. It describes the Pope "Big 4" in detail.

CEMENT—POPE

POPE MODEL H, THE \$165. SUCCESS

The machine that set the pace for Pope quality in the motorcycle field

LIGHT ECONOMICAL RELIABLE

Model H, Pope Motorcycle, With Imported Magneto—\$165

Model H is the leading high-grade, light-weight machine of moderate size and power—the one that has done most to popularize the sport of motorcycling.

It has made a great name for itself as a thoroughly reliable, road-worthy machine. It is recognized everywhere by riders and dealers as the standard of its class.

The tremendous success of this motorcycle has proved our original contention that there was a large and growing field for a light, moderate-powered, popular-priced motorcycle of the Pope type.

To keep pace with the popular demand, Model H will be manufactured in increasing quantities as originally planned.

DEALERS—Pope Motorcycles have made a wonderful selling record. Everywhere they have shown the way to large sales and quick profits. There are big opportunities for Pope Dealers in open territory. Write for terms.

Send for Catalog No. 70. It describes the Pope "Big 4" and Model H in detail.

The new Pope "Twin" will soon be ready! Watch for its announcement this Fall. It will round out a great selling line. Horsepowers and prices to suit all persons and purses.

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and gives maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen 1/4-inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per

day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4.....\$5.50	28 x 2 1/4.....\$6.50	28 x 3.....7.25
26 x 2 1/2.....6.00	28 x 2 1/2.....6.75	29 x 3.....7.50
	28 x 2 3/4.....7.00	

Other sizes on application.

Prest-O-Lite Motorcycle Gas Tank

The ONLY Practical Light for Motorcycles

The rider who stays close at home for fear he will not get back before dark, misses half the joy of motorcycling.

Night riding in safety is made both possible and pleasant by the use of a large enough lamp and a RELIABLE source of brilliant light.

The Prest-O-Lite Gas Tank is the ONLY lighting equipment that meets these needs.

A gas generator, besides being a troublesome nuisance, is not reliable. Small generator lamps are too feeble.

Prest-O-Lite floods the road far ahead with brilliant light—shows up the humps, ruts and puddles.

The flame neither flares up nor dies down—it is STEADY under all conditions. Turned on and off like a gas jet.

Exchange service wherever you may be, is provided by over 20,000 dealers (motorcycle and automobile). We will arrange prompt service for anyone, anywhere.

Price of Tank \$10

(Equipped with gauge.)

Dimensions: Length, 13¼ inches; diameter, 4 inches; weight, 8¾ pounds. 40 hours of light. Easily attached to any motorcycle.

Mr. Dealer:—*In this one ad alone there are plenty of reasons why you ought to be pushing the Prest-O-Lite Tank, for your customer's sake as well as your own.*

And if you want to retain your customer's trade on other things, don't get him into the habit of going elsewhere for Prest-O-Lite exchanged.

Prest-O-Lite Owners

Ernest B. Cowan, 960 Farnsworth Ave., Detroit, has his 4 H. P. Indian Motorcycle equipped with PREST-O-LITE. He says—"I find it is the only light on the market for satisfaction."

You Can Easily Afford It

Prest-O-Lite service costs no more—usually costs less—than the carbide a generator consumes.

The money you invest in the tank itself is not SPENT, because a genuine Prest-O-Lite Tank never gets to be second-hand, is always in demand, and is always a READY CASH ASSET.

In fact, no rider can afford to be without this combined CONVENIENCE, PLEASURE and INSURANCE. One accident due to poor light might cost you more than years of Prest-O-Lite service.

Don't Let Anyone Cheat You with an Imitation

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one ANYWHERE and ALWAYS. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank, gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

The Prest-O-Lite Company 246 East South St. Indianapolis, Ind.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

THE FLYING MERKEL

Why It Is the Most Comfortable Motorcycle

THE whole rear wheel construction of "The Flying Merkel," the only motorcycle with a Spring Frame and Spring Fork, is hinged at the pedal crank axle. The illustration shows how this permits the wheel to be raised in riding over bumps from 4 to 5 inches without changing the saddle position whatsoever. Note the long spiral springs encased in the rear stays which support the rider. This unique form of construction means the utmost in motorcycle comfort, which, together with powerful ball-bearing engine, remarkable economy and positive reliability, make "The Flying Merkel" riders the most enthusiastic and satisfied of the bunch.

16

The Flanders "4," at Jackson, Mich., on July 28, took first, second and third, in two of the four events, winning out against a large field of competitors.

MOTORCYCLE ILLUSTRATED

Speed, Power, Comfort, Reliability, Satisfaction, Thorough Construction, Easy to Handle, and Combining All Desirable Features—That's the Flanders "4"

A Machine That Wins Out Against All Others of Like Power and Against a Number of Almost Twice Its Power—that's the Flanders "4"—the Machine for You, Mr. Motorcyclist.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

There were just two 30.50 events on the program, and the Flanders "4" took one, two, three in both, leaving behind a field of competitors riding machines of other makes. In the ten mile event, the Flanders "4" took third, winning out over several twins of almost twice the rated horse power.

And the Flanders motorcycles were regular stock machines—the kind you get when you buy a Flanders "4." There is no necessity of "tuning up" a Flanders. The machines on the track are exactly like the one delivered to you if you buy a Flanders "4."

Flanders 4" MOTORCYCLES

\$175

At the Factory

While the Flanders "4" always gives an account of itself when entered in a race, it really is built especially for the road. And you can bank on a Flanders to give you the best possible service at all times and under every conceivable condition.

Before leaving the factory every Flanders "4" is put through a most severe test, insuring perfection in every detail. And when the machine gets on the road, we know that the service will greatly surpass even the expectations of the buyer.

The Flanders "4," whether for pleasure or commercial use, will always give the utmost service. It is reliability in itself, and if looking for a machine that will give absolute satisfaction at all times, the Flanders "4" is it.

At \$175 at the factory, the Flanders "4" is the best value on the motorcycle market. The machine is in every respect equal to others selling for \$50 more. But our facilities, our vast experience in building automobiles and motorcycles, make this low price for so high grade a machine possible.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the Motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

It Can Be Proved To You

The *extra strength* built into United States Motorcycle Tires thru our cooperative, four-factory method of manufacture will actually rid any motorcyclist of the annoyance and expense of unnecessary tire trouble.

United States Motorcycle Tires are *rugged* and *dependable*. Users have a right to expect more from them than from other tires because they combine every individual strong point of two brands of motorcycle tires, each of which was for years a recognized leader in the tire field. They are not only *four-factory-made*, but are *four-factory-tested* as well.

If your tire experience in the past hasn't been entirely satisfactory; if you feel that you haven't been getting service returns commensurate with your tire investments, we suggest that you try one or two United States Tires. They are sold by a majority of the substantial, year-in-and-year-out dealers throughout the country.

MOTORCYCLE ILLUSTRATED

NO. 16

AUGUST 8, 1912

PATTERSON REAPPOINTS CHAIRMEN

Heads of Competition, Membership, Legal Action and Publicity Committees are Retained and Compensation is Recommended.

THAT President Patterson, in taking up the duties of his office as chief executive of the F. A. M., intends to live up to the reputation he has already established for rapid-fire activity in connection with the affairs of the national body is evident from the celerity with which he acted upon the appointments of committee chairmen. Having in mind the call issued by Retiring-President Hamilton for a meeting of the Federation Board of Directors at Detroit, during the convention of the Cycle Parts Industries, August 6-9, President Patterson made his recommendations several days ago, as follows:

Chairman of Competition Committee, Dr. J. P. Thornley.

Chairman of Membership Committee, E. M. Estabrook.

Chairman of National Legal Action Committee, J. Leo Sauer.

Chairman of Publicity Committee, F. I. Willis.

It will be noted that in each instance the chairman is re-appointed, President Patterson's policy evidently being to retain in harness the officials who are seasoned by past experience, for the record-breaking pull of the coming year. He also recommends that each chairman receive compensation.

The President's letter is in full as follows:

"In accordance with the orders of former President Hamilton, who issued a call for a Directors' meeting at Detroit, Mich., August 6-9, I wish to make the following suggestions in regard to the different appointments:

"In the first instance I wish to appoint Dr. J. P. Thornley, of New York, as the chairman of the Competition Committee; E. M. Estabrook, of Bangor, Me., as chairman of the Membership Committee; J. Leo Sauer, of New York, as chairman of the Legal Action Committee; F. I. Willis, of Indianapolis, as chairman of the Publicity Committee.

"I would also suggest that the chairmen of the different committees be allowed a suitable compensation for the work devolving upon the office.

"As to the other appointments I want to hear the suggestions of the balance of the Board before making further recommendations.

"In the matter of the office of the President I will ask that the Board of Directors apportion a suitable sum for a good secretary or stenographer, as I expect to do considerable writing during the present year to the different officers and members."

REVISED CONSTITUTION AND BY-LAWS

Important Changes by Which F. A. M. Officials Will Perfect State Organizations as Governmental Units and Pave the Way for Unprecedented Co-Operation in National Body

BELOW are given extracts from the revised F. A. M. constitution and by-laws, embracing the more important changes provided for in the amendments adopted at the Columbus convention. As will be noted, the most significant revisions have to do with the reorganization of the national body, with the States as governmental units. Copies of the constitution and by-laws, embodying the proposed changes have been forwarded to President Patterson and Secretary Gibson by Chairman J. Leo Sauer, of the National Committee on Legal Action, who introduced the amendments at Columbus. At the same time Chairman Sauer forwarded the following letter, referring to the revisions and the improvements at which they are aimed:

"In accordance with the amending resolutions introduced by the undersigned and unanimously adopted by the 1912 National Assembly of the Federation of American Motorcyclists, I am today forwarding to our secretary-treasurer a copy of a revised Constitution and By-laws.

"The Assembly adopted eight amending resolutions. Seven of these are very specific and under them the committee was authorized simply to phrase certain changes into the Constitution and By-laws. The eighth amendment, however, providing for a definition of the powers and duties of State Commissioners, permits the Revision Committee to exercise its own judgment, with comparatively few limitations.

"The committee has endeavored, however, not to take undue advantage of its opportunities. We have given this question very careful consideration; in fact it has had my attention for more than a year, during which time I have consulted with a number of State Commissioners and have also obtained some very valuable information from Mr. E. M. Estabrook, the chairman of our Membership Committee.

"You will find the duties and the privileges of State and local commissioners defined, but only in a general way, in Article VIII of the By-laws. In writing the seven sections which make up this article, I have followed the principle adopted by the makers of the Constitution of the United States, in the sense that the State governments are to exercise all powers that are not expressly delegated to the national organization under our Constitution and By-laws. Provision is made for the appointment of State Commissioners by the National President, but only in the event of the failure of the members of any State to nominate their own commissioner. Of course, as President, you will appoint the first set of State Commissioners, but thereafter each State will be privileged to name its own chief executive.

"When appointed by you State Commissioners will be expected to proceed at once to the organization of the territory under their respective jurisdiction. In doing so, they will follow out a general plan to be outlined by the chairman of the Membership Committee with your approval. The chairman of the Membership Committee is familiar with this feature of our work and

capable of doing full justice to the situation. Under the new Constitution, he will simply outline a general plan of organization so as to have uniformity in all the States, but upon this foundation State Commissioners will be expected to build their own organizations and to make them as efficient as they possibly can.

"For example, there is no reason why in due time, most of the State organizations cannot be made small replicas of the national body. It would not be well to go into all the details in our Constitution and By-laws, but it is simple to foresee that live commissioners will so effectively organize their States as to permit of annual conventions and quarterly or even monthly meetings; the election of a secretary-treasurer; the appointment of State committees, which will be the equivalent in all the States of the national committees and work in co-operation with the latter; State race meets, endurance runs, hill climbs, economy trials and tours and, in fact, all the attractions that are now extended to the riders of the national body.

"But these are all details which have no place in our Constitution and By-laws and which will require time to put into practice. But I believe that our plan of allowing a commissioner a wide latitude will be productive of rivalry among State commissioners, which will prove beneficial to the entire organization. In this connection, the time will no doubt come when our Board of Directors will offer prizes each year to the commissioner in whose State (1) there has been the largest percentage of increase in membership; (2) there has been brought about the most effective State organization; (3) in which has occurred the greatest accomplishment of value to the F. A. M. and its members, and, in fact, a number of other things which will no doubt suggest themselves in time.

"Referring to Section 7, you will note that the committee has clothed local commissioners with authority in proportion to their responsibilities. The new Constitution, however, will prevent even the slight-

est confusion of powers as between the national officials and State and local commissioners. The underlying principle is carried throughout the entire Constitution and By-laws, namely, that each locality within each State, and each State within the nation, shall exercise the full authority of the national body, except as expressly restrained by the provisions of the Constitution and By-laws, which specifically state the extent of the powers of the President, the Board of Directors and the National Committees. On the other hand, the change should make for that beneficent co-operation which it has heretofore been so difficult to secure.

"Under the new Constitution means are available for making the Federation of American Motorcyclists a model of administrative machinery, from the local commissioners up to the chief executive of the national body. Your committee is satisfied that the change will soon demonstrate its merit and that no one will ever have occasion to regret that it was authorized by the delegates who attended the Columbus meet."

The most important revisions in the Constitution are embraced in the two sections of Article 4 and in Section 6 of Article 5, as follows:

ARTICLE IV.

UNITS OF GOVERNMENT.

Section 1.—For convenience of government this Federation shall be divided into as many units as there are States. At the discretion of the Board of Directors, branches may be established in the American dependencies or in foreign countries.

Sec. 2.—The F. A. M. shall be represented in each State by a commissioner, who shall exercise in his State the full jurisdiction of the national organization, subject, however, to the Constitution and By-Laws, the resolutions of the National Assembly, and, as provided for in the Constitution and By-Laws, the acts of the President, Board of Directors and National Committees.

Sec. 6 of Article V.—There shall be five national committees, each consisting of a Chairman and the Board of Directors. All appointments of committee chairmen shall be made by the President, subject to the approval of the Board of Directors. Said appointments shall be for the remainder of the current Presidential term. National committee chairmen must be appointed within thirty days after the President has qualified, and if the President fails to appoint, the Board of Directors by a majority vote of the entire board, shall do so. The national committees shall be known respectively as Committees on Membership, Legal Action, Competition, Highway Improvement and Press, respectively.

Following are the most significant revisions in the By-laws, embraced in Section 10, of Article 7, and in Article 8, the latter dealing with State and local commissioners and their duties:

Sec. 10 of Article VII.—The F. A. M. shall maintain a touring bureau, in charge of a manager to be appointed and removable by the President, with the approval and concurrence of the Board of Directors.

ARTICLE VIII.

STATE AND LOCAL COMMISSIONERS.

Section 1.—Means for the organization of State government shall be devised by the Chairman of the National Membership Committee subject to the approval of the President. It shall be the duty of said Chairman to maintain, as far as possible, uniformity in the different State organizations, permitting to the members of each State, however, every possible opportunity for self-government not inconsistent with the Constitution and By-Laws and the objects and purposes of the National Organization.

Sec. 2.—The members of any organized State shall each year at some date prior to the opening of the National Assembly, nominate a State Commissioner, and the presentation, through the National Secretary, of his certificate of nomination to the National Assembly, shall be considered as the election of said

E. B. Ewell, of Richmond, State Commissioner for Virginia.

Commissioner, unless said nomination be over-ruled by a three-fourths vote of the Assembly. In default of the nomination of a Commissioner by the members of any State, a Commissioner shall be appointed by the President with the approval of the Board of Directors within thirty days after the adjournment of the National Assembly.

Sec. 3.—Immediately upon assuming office the Commissioner of any unorganized State shall proceed to organize his State in accordance with the plans proposed by the Chairman of the Membership Committee as aforesaid. State Commissioners shall, however, devise additional means for increasing the value of their State organizations, provided only that said means are not inconsistent with the general plan of organization applying to all States.

Sec. 4.—State Commissioners shall have full authority to appoint and remove county and local commissioners, and the latter shall co-operate with the State Commissioners in the same manner as the State Commissioners with the national body. Where there are no State Commissioners, or where the latter are negligent, appointments of county and local commissioners may be made by the President, upon recommendation by the Chairman of the Membership Committee.

Sec. 5.—The State Commissioners shall submit to the National Secretary reports on all matters affecting the interests of motorcycling and, in particular, the appointments of local commissioners, road and touring information, municipal, county and State legislation, the organization of new clubs, racing conditions, etc. Said reports shall be submitted at least quarterly, and oftener if necessary. Each State Commissioner shall also submit before July 1 of each year an annual report to the National Assembly.

Sec. 6.—State Commissioners shall co-operate with and carry out the instructions of the National President, the Board of Directors and the Chairmen of the National Committees. They shall, when necessary, transmit such instructions to the local commissioners.

Sec. 7.—Each local commissioner shall be the official representative of the F. A. M. in his district and shall be clothed with the full authority of the organization in his district, except as to powers which are delegated to others under this Constitution and By-Laws. A local commissioner shall assist the State Commissioner in increasing the membership of the organization; and developing ways and means for adding to the popularity of the sport in his locality; organizing local riders; advancing the work of the organization in large cities through the appointment of ward commissioners; assisting the State Commissioner in carrying out the policies of the State and the National Organization; rendering regular reports to the State Commissioner and in taking any further action to the end of strengthening the beneficial influence of the F. A. M. in his county, city, town or village.

GILMER MADE GAME FIGHT.

GEORGE GILMER, of Charlottesville, Va., the only Virginia rider to make the trip by motorcycle to the Columbus convention, appears in the accompanying photograph at the right. He was halted for repairs as the picture indicates and is being assisted by another tourist. Gilmer became known as "Old Virginia" to the boys in Columbus. On his way back to Charlottesville he ran into rain and the worst kind of muddy roads and was finally forced to abandon the trip and ship his machine home, much to his disgust. He had made a game fight to get through and was peeved when forced to quit.

Englewood Club riders, of Chicago, on a recent outing.

GIBSON'S LETTER TO A. C. U.

National Secretary Thanks British Organization for Courtesies Shown to American Tourists.

WITH reference to the proposition submitted at the Columbus convention by W. H. Wells, of London, for a reciprocal agreement between the British Auto Cycle Union and the F. A. M., Secretary Gibson of the Federation has forwarded the letter printed below to the headquarters of the English organization. Mr. Wells, as the official representative of the A. C. U., explained the plans of the English body for a more thorough understanding between the two organizations, and a formal reply to his proposition is now being framed by the F. A. M. Board of Directors to which the matter was referred at Columbus. Secretary Gibson's letter is as follows:

"This letter will recall to your mind the recent act of your association in sending to America a personal representative, namely, Mr. W. H. Wells, of London. Mr. Wells was delegated to bring to the Federation of American Motorcyclists, of which he is member No. 2843, in the convention assembled at Columbus, Ohio, July 17 to 21, the greetings of your English association.

"It was with great pleasure that, although Mr. Wells was not a properly accredited delegate to our convention, we accorded him the privilege of the floor because of the distinction under which he was there officially. Before the meeting Mr. Wells presented to me, personally, your letter dated July 5, which was an official communication in which was outlined the well-expressed desire of the Auto Cycle Union of Great Britain, to form with the American governing body, a mutual working agreement, with the end in view of having an amicable understanding for mutual benefits, and to obtain for the members of each association reciprocal courtesies while touring in the territory governed by each. I wish to state that I carefully read this letter to the delegates assembled at the convention.

"Action relating to this matter was put into the hands of our Board of Directors, and, as I am not one of that board, I officially have nothing more to do with it. You will doubtless, hear officially from our Board of Directors some time during the month, for our board will convene for a business session at Detroit, Mich., August 6 to 9 during the annual gathering of the Cycle Parts Industries Association.

"This letter is written to you because of the following facts: Mr. Wells, in an infor-

mal personal talk after he had orally presented other elaborations on your desires, made mention of the fact that the Auto Cycle Union had officially granted within the past year, to three hundred members of the F. A. M. touring abroad, the courtesies of your organization. This, surely, was a very kind act on the part of your organization and shows the true sporting instincts, personally and officially, and your desire to be helpful to the touring American brother

"It was the unanimous vote of the delegates assembled, that the American organization, through me as its secretary, express to you and through you to the other officials and members of the Auto Cycle Union of Great Britain, the heartfelt thanks of the American organization for these courtesies to our members and to those who are not united with us.

"The motorcycling situation in Europe is much different from that in America in one respect, that is: A certain long distance on our continent might easily be wholly in the United States, while one of equal or less length might cover a half dozen countries in Europe. Therefore, as regards customs helps when touring, we have very little to offer. Really, we are down to one borderland, that invisible line between the United States and Canada.

"As you are doubtless aware, we have established very pleasant relations with the Canadian motorcycle organization; we helped them to form, our officers wrote them many very pleasant, helpful letters, and we gave them many good pointers. They will escape some of the pitfalls that our organization got into during our early history; which happily we overcame without serious trouble. Our membership cards are mutually recognized in regard to competition, and we hope soon to

Chicago boys of Division B looking pleasant for the camera man at Columbus.

arrive at an even more helpful, beneficial, working agreement.

"To digress a little, I wish to state that your Mr. Wells used to live here in Westboro, Mass., having been connected with the Humber Bicycle Company and the Locomobile Auto Company. I only knew him slightly then, but when he recalled the matter to my attention, I remembered the facts of the case. I knew his brother, Harry, personally.

"I wish to express to you my personal greetings and hope that the correspondence occasioned by the matter at hand between us will be continued."

TRADE CAPTAINS ARE BUSY IN DETROIT

Two Hundred Boosters From All Sections of Country Open Cycle Parts Convention —List of Those Who Are Enjoying Fine Program

DETROIT, Mich., Aug. 6.—With nearly two hundred trade folk and visitors in attendance and every part of the country represented, the sixth annual convention of the Cycle Trade Industries promises to uphold in brilliant fashion the notable record of similar previous occasions. The Old Guard, under the adroit leadership of General Surre, enthusiastically reinforced by a goodly host of "never-been-there-before" folks, hold easy control of Fort Popularity which is shifted this year from the breeze-swept shore to automobile-famed Detroit.

The Official Headquarters.

The Hotel Cadillac is the official headquarters and a big majority is holding forth there, with others registered at the Ponchartrain and the Tuller. Within six hours of the arrival of the early comers this morning, 168 visitors had registered at the official headquarters and received, in addition to their official perquisites, a handsome be-ribboned cane furnished by the Kokomo Rubber Company.

Jolly Party from the West.

A jolly party, including Messrs. Surre, Schack, Henry, Johnson and Fry, and some fourteen or fifteen others, came west by night boat from Buffalo. Many of the Eastern crowd hailing from New York State, Eastern Pennsylvania and New England, traveled to the convention city over the New York Central and the Wolverine. Others arrived in such numbers as to justify the prediction that by Wednesday night there would be more people registered than at any previous convention, not even excepting the record-breaking affair in Atlantic City last year.

Boat Trip to Lake St. Clair.

The first event on the program was a sailing party to Lake St. Clair on the steamer *Sappho*, which had been chartered for the special use of the party. About 140, including nearly two score of the gentle sex, were the guests of the managing duet, Messrs. Surre and Dave Smith. There was dancing and light refreshment and a happy-go-lucky time

for all. The boat started under a threatening sky and while the leaden tinge to the atmosphere was never reflected in the faces of any of those aboard, no one seemed to object to the strenuous efforts of Old Sol to dissipate the haze, which the old fellow succeeded in doing by four o'clock.

A Big Theatre Party.

The weather conditions for the return trip were ideal and it was a joyous and well-satisfied crowd which was disembarked at the dock ready to do ample justice to one of the Cadillac's famous dinners. Tonight 150 members and guests of the allied associations occupied choice seats at the Temple Theatre to witness a first-class vaudeville performance.

Enthusiasm Records Broken.

Opinion is divided as to whether Detroit is as well adapted to the requirements of the situation as is Atlantic City, but at this meeting it is the consensus of opinion that the crowd's the thing. Here there is a crowd that could enjoy itself in the midst of Sahara, assuming, of course, that there was at least one oasis of moisture in the vicinity.

Speakers at Joint Meeting.

Announcement was made a day or two ago of the names of the speakers at the joint meeting of the cycle trades, as follows: F. I. Willis, of the Hearsey Willis Company, Indianapolis, "The Jobbers"; A. B. Coffman, Consolidated Manufacturing Company, "The Motorcycle"; Clarence E. Whitney, The Whitney Manufacturing Company, Hartford, Conn., "The Parts Makers"; John W. Henry, Vim Cycle and Hardware Company, Buffalo, "The Bicycle"; G. H. Hamilton, Federal Rubber Manufacturing Company, "Federation of American Motorcyclists."

Arrivals at Headquarters.

Those registered at the headquarters today were: Dave Smith, C. E. Moorehouse, W. J. Surre and wife, Maxine and Noah Van Cleef, M. L. Rosenberg, Max M. Sladkin, J. W. Grady, W. A. Johnson, M. R. Brown, G. W. Nock, T. Rick and wife, J. J. Harris and wife,

J. W. Henrick, H. O. Wait, Mrs. Robt. Henry, Miss Henry, Miss Alice M. Henry, Miss O'Keefe, Howard French, wife and son, W. G. Schack, F. J. Radloff and wife, Clinton Lovell, G. F. Jackson, wife and daughter, W. S. Surple, H. A. Williams, G. H. Westing, W. H. Grover, F. B. Parks, E. H. Strickland and wife, E. N. Hawthorne, E. S. Hawthorne, J. E. Poorman, Jr., J. Louis Rastatter, E. R. Pickard, D. W. Page, M. J. Horton, John Ide, S. B. Dusenberre, Harry G. Jacobs, J. Leo Sauer and wife, W. F. Sayle, Phil. H. Dorn, D. L. Spraker, F. W. Grubb and wife, W. S. Tullis, Louis Schwab, H. C. Bush, Keyser Fry and wife, C. J. McCurry, George H. Greys and wife, J. J. Smith and wife, R. B. Abbott, A. D. Meiselbach, Daniel F. Printz, J. C. Ferguson, Chas. E. Weaver, Harry Svensgard, W. F. Bartlett and wife, E. C. Huntington, Wm. Holland, Wm. F. Emerson, Chas. H. Persons and wife and son, F. M. Germane, A. N. Goodfellow, Stanley Wilson, J. W. Brandt, H. G. Davidson, J. W. Luck, A. Wallerstein, R. F. Kelsey, Harry C. Queen, F. W. Fee and wife, A. H. Harrop, J. C. Manternach, A. Eugene Bolles, C. J. Smith, H. L. Smith, H. E. Smith and wife, Al. Ray, R. W. Dick, W. C. Roby and wife, S. C. Hurley and wife, T. C. Larter, M. M. Stein, J. W. Jones and wife, A. Kinlock, J. P. Lamb, R. M. Barweiss (known as Budweiser), J. W. Spray, M. R. Davies, R. F. Barnes, T. J. Sullivan, G. W. Sherman and wife, Roger Sherman, R. M. Brownson and wife, R. M. Gingland, R. P. Hanson and wife, Fred C. Fromm, J. B. Trossel and wife, Geo. W. Breed, W. W. Totman, Guernesey Van Riper, A. J. Fisk, F. I. Wilis and wife, Miss Fannie Slocum, R. H. Winship, O. W. Mott, wife and son, Miss Ballard, Duke Trempi, F. Hawes, D. P. Harris, A. Edwin Batzell, E. C. Bowman, Geo. H. Kaufman, F. G. Bremer, I. N. Wilson, H. E. Krause, Wm. Smallwood, M. E. Mason and wife, A. B. Coffman and wife, F. G. Finkendandt, S. A. Waddle, H. H. Woods, Merle Sidener, John Neuberger, S. G. Lewis, wife and daughter, W. J. Wandersee, W. E. Diehl, A. J. Musselman and wife, G. W. Shroyer, L. G. Sigourney, E. W. Scott, P. H. Dover, L. J. Hood, E. R. Dumcolton.

BREEZY JOTTINGS FROM THE CONVENTION

GEORGE SHERMAN told a **MOTORCYCLE ILLUSTRATED** representative that the Triumph Manufacturing Company would soon place on the market a three-wheel delivery van of entirely new design.

NOT to be outdone, even by Dave Smith, in adding jollity to the occasion, were the ladies, chief among them the Misses Henry, Mrs. A. B. Coffman, Mrs. A. H. Strickland and Mrs. Surre.

A. J. MUSSELMAN was happy over the fact that yesterday in Detroit on a new golf course he had made eighteen holes in seventy-eight. He missed his lunch today to endeavor to do even better than that. Surre had time for only a plate of ice cream for luncheon.

ABOARD the *Sappho*, on the trip to Lake St. Clair, Dave Smith demonstrated to the satisfaction of all that he had gained another year on Father Time. At the rate the Down East cranberry grower is becoming younger year by year his friends confidently expect to see him trudging to primary school some day.

THE Corbin trio, headed by the indefatigable Harrop, provided the New Britain concern with the excellent representation it invariably has at all trade gatherings.

ONE had merely to whisper Excelsior to J. W. Grady to produce a volume of encomiums for the Chicago machine.

JACK BRANDT, of the Troxel Company, exhibited as of yore the happy faculty of making business dovetail to a nicety with fun.

W. G. SCHACK was seen anxiously scanning the horizon for Joe Merkel, for whom he had in reserve, he said, more than one strike to spare.

EX-SHERIFF HENRY had no occasion to make any arrests. His sister met so many good fellows that she was completely at a loss to make a selection.

J. C. FERGUSON, of the Eclipse Machine Company, was easily tempted to prove that 100,000 1913 machines were not at all beyond the range of possibility.

SECOND DAY BREAKS THE RECORD

Arrivals at Detroit Tuesday Night and Wednesday Morning Set New Attendance Mark—A. B. Coffman Re-elected President of M. M. A.

DETROIT, Wednesday, August 7.—Last night's and this morning's arrivals brought the total above that of any previous convention. The East was as well represented as at Atlantic City. A number of the motorcycle manufacturers were late, but in time to insure a representative attendance at today's meeting of the M. M. A., at which, in addition to the re-election of A. B. Coffman to the presidency, the principal feature was the discussion of the Chicago show situation. It developed that the motorcycle manufacturers would have to exhibit either in the Coliseum basement or in another building, as there is not space enough available in the Coliseum gallery.

Some Well-Known Figures.

Among the handsomest, as well as the most useful, souvenirs were those distributed by A. B. Coffman, the live one behind

A. B. COFFMAN,
Re-elected President of M. M. A.

the Yale. President Beysler, of the Reading-Standard Company, is present for the first time at a cycle trades convention. Remppis, of course, is also here. Sales Manager Arthur Davidson is at this writing the sole representative here of the Milwaukee company, but then Art can, when the occasion requires, do the work of two average men. Geo. M. Hendee is absent for the first time

in many years, and F. J. Weschler is his capable proxy.

More Entertainment Features.

Nearly threescore ladies attended this afternoon's reception. To-night a bowling match will feature the program. Seven or eight teams, representing, respectively, the motorcycle and bicycle manufacturers, the parts makers, the jobbers, salesmen, the press and so forth, will smash the lumber in frantic endeavors to take away those silver cups.

Still They Come.

Those to register Wednesday noon were: J. E. Talty, J. D. Hurley, Paul R. Acton, M. C. Stokes, W. H. Jennings, H. H. Calboth and G. H. Hamilton. Mr. I. N. Wilson was very much pleased with his first appearance at the cycle trades convention. A. B. Coffman, of the Consolidated Manufacturing Company, and Mrs. Coffman, along with Mr. Cornish, Eastern representative for the Yale, rode from Toledo to the convention in an automobile.

Busy Morning Session.

At this morning's session of the Motorcycle Manufacturers' Association two hours were taken up in the reading of the annual reports of officers and committees. Among the latter, those of the Dealers' Information and Publicity Bureaus showed that the results of this work had been most satisfactory. The F. A. M. Touring Committee and the Committee on Freight Rates reported that a hearing has been promised for the fall by the Interstate Commerce Commission. A. B. Coffman (Yale) presided, with Mr. Hardin (Pope) as secretary. Others present were Messrs. Jacoby (Merkel), Weschler (Indian), Schack (Emblem), Stanton (Flanders), Turner (Minneapolis), Johnson and Colburn (Pierce), Schickel (Schickel), Deysler and Remppis (R-S), Arthur Davidson (Harley-Davidson), J. D. Hurley (Thor), Ignatz Schwinn (Excelsior), W. T. Marsh (M. M.), W. T. Henderson (Henderson), Brownson and Sherman (Triumph).

FREDERICK WHITFIELD.

IT is with deep regret that the announcement is being received in trade circles of the death of Frederick Whitfield, secretary of the Excelsior Motor, Manufacturing & Supply Company. Mr. Whitfield died on

Friday, August 2, after having been seriously ill only a week. He had suffered for some time from stomach trouble, but the turn which necessitated a hurried operation was unexpected. Mr. Whitfield's ailment was diagnosed as cancer of the stomach.

Despite the fact that he had been in the motorcycle field only a comparatively short time, Mr. Whitfield had endeared himself to a host of friends. He was looked upon as a business man of great energy and was a keen student of men and conditions. He was a lawyer with a large practice in Chicago when he was called upon to take charge temporarily of the financial side of the Excelsior company's affairs during its reorganization by Ignatz Schwinn. Mr. Whitfield became so deeply interested in the work and the possibilities of the motorcycle field that he accepted the position of secretary with the new Excelsior company and became a potent factor in its advancement.

SEEKS TOURING COMPANION.

C. E. PARKER, of Dunbar, Pa., has laid plans for a trip to the Pacific coast, to start about September 1, and is anxious to get into communication with another rider who intends to make the cross country jaunt. Parker will ride a Tourist Trophy Indian 7, and he suggests that if he can locate a companion who also mounts an Indian machine, the problem of carrying spare parts and repair kits will be simplified. Parker may be addressed in care of the H. C. Frick Coke Company, Dunbar.

CIRCLEVILLE, OHIO, now has two motorcycle policemen

Miller Bros.' Attractive Pierce Agency in Washington, D. C.

FACING road conditions which would have dampened the enthusiasm of any but the most ardent motorcyclists, the riders composing the Northeastern F. A. M. touring division pulled out of Columbus on Sunday morning, July 21, for the return trip to Albany, and their experiences will be discussed for many a day. The outward trip, difficult as it was for the Northeastern squad, was an entertaining little social jaunt compared with the run homeward over rain-flooded roads, covered with mud and clay. Few endurance contests in this country have put the riders to a more severe test, and that the six enthusiasts who finally arrived in Albany earned their F. A. M. touring medals goes without saying.

On Saturday afternoon, after the final business session of the convention, the riders began to leave for home, some singly and others pairing up. Fully half the boys had enough of the Buckeye State clay on the trip into Columbus, and these riders shipped their machines home. The supply of empty crates ran short and some of the riders had to have special crates made. About fifty riders of the Northeastern and Northwestern divisions left Columbus Sunday morning, bound for Cleveland and Toledo, respectively.

Heavy rains had left the ordinarily poor roads in very bad condition, and a storm which broke just after the boys had started drenched the riders and made riding extremely disagreeable. The roads were very rutty and the rain had filled the ruts and flooded the roads to such an extent that progress was slow and precarious.

Rizika Has First Spill.

Abe Rizika, of Utica, N. Y., on a Monarch, went down in one of the deep holes which was hidden by the water, but escaped with bent pedals and a few bruises. Worthington was the first town reached; then the route led to Delaware, 25 miles from Columbus. Here a number of the riders decided to stop over another day until the roads had a chance to dry out.

W. Ronald, riding a Thor 5, skidded as an auto was passing and his front wheel was smashed, the tire was cut in two, his lamp

was broken and the handlebars and pedals were bent. The rider escaped injury. A farmer's rig was pressed into service and the wrecked machine was carried to the nearest railroad station and shipped to Cleveland. Here repairs were made and the rider joined the tourists at this point.

Abe Rizika and C. A. Roth, the Monarch riders, had plenty of belt trouble. Between them they made nine stops because of broken belts. As the belts were then too short to be of any use, Prosper Jenny, of Utica, on a Harley-Davidson twin, towed them back into Delaware, from which point they shipped their machines to Utica. Jenny decided that a parlor car seat was to be preferred to one on a skidding motorcycle and he also shipped his machine home to Utica.

A Genuine Endurance Run.

From Delaware to Marion the going was very bad and the riders were strung out all over the road in an endeavor to prevent falls. A dinner stop was made at Marion and here the Toledo division left the Eastern boys. About 35 riders were then left in the Eastern division and they set out to reach Cleveland before nightfall. From Marion to Bucyrus the roads became worse and many skids and falls taxed the riders' endurance.

C. T. Robbins, of Cleveland, on his Indian 7, crashed into a pile of crushed stone, breaking his front fork and twisting the wheel and handlebars. With the assistance of some of the other riders the wheel was pounded into shape, the broken fork springs were removed and the rider rode with rigid forks into the next town, where repairs were made. Howard Smith, on a 1910 Flying Merkel 6, with L. Murdock as passenger, had considerable tire trouble due to pinched tubes. Seven punctures in three miles kept him busy. F. Woodworth, of Youngstown, Pa., riding a Thor 5, broke his front fork springs when he hit a rock, but after tying up the forks with wire he rode into Cleveland. Then he shipped his machine home.

After leaving Bucyrus the going became so utterly bad it was practically impossible

to keep the machines on the road. Deep clay, mud and water began to conquer machines and riders, and one by one they were forced to quit. Farmers' rigs were hired by some of the less determined tourists and the machines were taken to the nearest railroad station and shipped to Cleveland.

At a fork in the road the remaining riders became separated, as no sign posts were visible. Both roads were in awful condition and each rider picked his own route. One squad led by Earl Ellsworth and W. Hetherington, Jr., became mired in the clay and mud three miles from Belleview. It was necessary for three men to handle each machine, and it took three hours to proceed as many miles. Darkness overtook the tired riders before a town could be reached, and as it was impossible to proceed any further the machines were left standing in the mud while the riders sought accommodation in nearby farmhouses.

Only Six Riders Survive.

After the riders had become discouraged at not being able to find a place to eat and sleep one farmer was approached who offered to put up the riders for the night, provided they would rough it. Only six out of the original 35 riders who left Columbus survived the grueling run to this point. They were John Kienzle, Indian 7, of Lorain, Ohio; Geo. Erving, Harley-Davidson 4, of Elyria, Ohio; Howard Smith, with L. Murdock as passenger, Merkel 6, of Albany, N. Y.; Earl Ellsworth, Indian 7, of Rochester, N. Y.; Chas. Springborn, Merkel 7, of Buffalo, N. Y., and Wm. Hetherington, Jr., Indian 7, of Brooklyn, N. Y.

With the united efforts of all the riders each machine was carried into the farmer's barn, and then, utterly exhausted, the boys took a brief rest while the farmer's wife prepared a supper. Sleeping accommodations could be provided for only four men, two others slept on a couch and the tallest man slept on the floor, as he needed the most room.

A second division, led by A. H. Gingras and five other riders of Holyoke, Mass., became mired just on the outskirts of Florence, Ohio. The machines were stored in a

nearby barn and the riders repaired to a country grocery store. The storekeeper was routed out of bed and the riders nearly bought out his stock. Canned goods, cheese, crackers and "pop" refreshed the riders and then a suburban train was boarded for Burlington Heights. Here sleeping accommodations were obtained at the Lakewood Hotel and the tired riders turned in immediately. Early the next morning they rode back to Florence and tuned up their "steeds" for the day. Each division started about the same time over equally bad roads, and shortly before noon the parties met at Elyria, 40 miles from Cleveland. Here an hour's stop was made for repairs and fill tanks and give the other riders an opportunity to regain their positions.

By Boat to Buffalo.

From Elyria to Cleveland excellent time was made and the riders repaired in a body to the nearest restaurant for refreshments. W. Hetherington, Howard Smith and L. Murdock were held up by a Cleveland policeman who demanded to be shown license tags. He was persuaded to let the riders off when it was explained that they were only riding through to New York. Howard Smith and three others decided to continue the ride into Cleveland via the poor roads, while the nineteen other riders of the combined divisions who had reached Cleveland agreed to take the night boat for Buffalo.

It was a hungry lot of tourists that boarded the boat. Some of them had arrived in Cleveland a few minutes prior to the boat's leaving and they had no opportunity to get supper. Geo. W. Bell, W. R. Morrison and P. M. Moulden returned to Cleveland via Akron. They had a hard trip. Mud, clay and water almost swamped them, and a minister in his buggy gave timely assistance in dragging them from the mire at one point. F. Blankshine, on an Emblem 7, ran into a steam roller near Norwalk. He was proceeding slowly at the time and neither rider nor machine suffered injury.

The following riders arrived in Cleveland in time to sail on the C. & B. steamer: A. H. Gingras, Holyoke, Mass., Indian 7; C. W. Burke, Schenectady, N. Y., Merkel 6; Earl C. Ellsworth, Rochester, N. Y., Indian 7; P. P. Parsons, Cortlandt, N. Y., Excelsior 7; "Whipple," the motorcycle man, Chicago, Ill., Flanders 4 (shipped machine from Columbus to Cleveland); Dayton Roth, Utica, N. Y., Monarch 5 (shipped machine Columbus to Utica); Abe Rizika, Utica, N. Y., Monarch 5 (shipped machine Columbus to Utica); P. J. Jenny, Utica, N. Y., H-D 7 (shipped machine Columbus to Syracuse); W. T. Sherman, Moravia, N. Y., Indian T. T.; Wm. Hetherington, Jr., Brooklyn, N. Y., Indian 7; Geo. W. Bell, Washington, D. C., Thor 4; W. R. Morrison, Washington, D. C., Yale 7; P. M. Moulden, Washington, D. C., Thor 4; F. Blankshine, Cortlandt, N. Y., Emblem 7; E. R. Collier, Cortlandt, N. Y., Excelsior 6; Chas. Springborn, Buffalo, N. Y., Merkel 6; S. M. Wheeler, Hubbardston, Mass., Thor 4.

Side Trip to Niagara Falls.

Bananas at 10 cents apiece and doughnuts at a nickel each were all the riders could get for supper. C. W. Burke forgot the number of his stateroom and, being too tired to look up the purser, he slept on the deck all night. The riders gathered in the reading room of

the steamer on the trip out, where each tourist related his experiences. Up to 12 o'clock only five of the boys had told their stories and the purser called the meeting off, sending the noisy (as he called them) riders to bed.

Upon leaving the boat, much to each rider's surprise, he received only a quart of gasoline in place of the full tanks which had been emptied before going on board. All the riders rode to the Neale, Clark & Neale Company's store, where the machines were left while Niagara Falls was visited by the riders in a body. At 3 o'clock a start was made for Rochester, and the riders arrived without accidents at 6 p. m. The roads were in splendid condition. The keys of the clubhouse were turned over to the visiting riders and a very pleasant evening was spent.

Early the next day two of the members who had been delegated by the president of the club piloted the riders through the city streets, pointing out the places of interest. Ontario Beach was visited, also the large reservoir, of which Rochester is justly proud.

A. H. Gingras picked up a large jagged piece of iron in his rear shoe, Earl Ellsworth received two punctures, and Wm. Hetherington, Jr., lost the generator part of his lamp while riding through the city streets. Accordingly Rochester was called the "hard luck city." A start was made for Syracuse at 2 p. m. A. H. Gingras had three blow-outs and lost two hours in repairing them. The roads were excellent the entire distance.

C. W. Burke, of Schenectady, Merkel 6, broke down just outside the city limits and had to ship home. S. M. Wheeler, of Hubbardston, Mass., riding a Thor 4, was struck by an auto near Syracuse and his machine was badly damaged. He had one of his toes broken and had to give up the plan to reach

home on his machine. After his injury had been dressed he rode home on the train.

Off on the Last Leg.

Early Thursday morning the remaining few riders prepared to cover the last lap of the 1,600-mile journey. Over excellent roads as far as Fonda they made fast time. Here some rough roads were encountered, but they gave the boys little trouble. A dinner stop was made at Fonda and after lunch the boys, all anxious to "check in," hit up a lively pace. Amsterdam Hill caused some trouble, after which the riders opened up for the few remaining miles to Albany. A. H. Gingras, of Holyoke, while coasting down a long grade, failed to see some fresh oil which had been poured on the road and took a spill, covering himself and his machine with the slimy mess. A kerosene bath removed most of the oil and he then proceeded with the squad.

At 5:30 p. m. the riders checked in at the clubhouse of the Albany M. C. and finished the 1,600 mile "tour," which really was a double endurance run, say the survivors.

The following men checked on schedule time: A. H. Gingras, Howard Smith and L. Murdock, S. Whittaker, C. A. Greene and Wm. Hetherington, Jr.

Out of the original 29 riders that left Albany on July 13 only six had arrived home on time. Nine had dropped out of the tour due to breakdowns; ten shipped their machines back home, and five left Columbus to visit the factories of their respective machines before returning to Albany. Howard Smith, who rode the Merkel 6 with L. Murdock as passenger, gave a splendid exhibition of the practical value of the motor two-wheeler as a passenger vehicle. He rode the entire distance with his passenger, and he had the distinction of being the only tandem rider of the Northeastern division to complete the journey to Columbus and return.

A Sunday touring squad in front of the headquarters of the Moreland Cycle Co., 413 North 48th avenue, Chicago.

ESLER WANTS A PARTNER.

JOE ESLER, of Quincy, Ill., who made a long European tour last year with William Streiff, is now planning a motorcycle trip to the Pacific Coast and is on the lookout for a traveling partner. Any rider having a similar trip in mind may hook up with an experienced tourist by dropping Joe a line at Quincy.

C. F. DIX, local F. A. M. commissioner in Stockton, N. J., and Indian agent for Stockton and vicinity, has now added Riegelsville, Pa., and Milford and Frenchtown, N. J., to his selling territory.

SUNDAY RACE MEETS.

COLUMBUS, Ohio.—Announcement is made that there will be races every Sunday afternoon at the Columbus Motor-drome. The meeting of the F. A. M. in the Buckeye capital and the attending races has stimulated interest in the motorcycle racing game in Columbus and central Ohio and no end of enthusiasm is shown over the announcement of General Manager W. H. Snyder.

A number of the Columbus riders who rode as amateurs during the F. A. M. meeting have turned professionals.

ONE OF THE BEAUTIFUL SCENIC SPOTS
IN BLUE RIDGE MOUNTAINS.

WE have all heard the mossy argument to the effect that "anticipation is better than realization," but the writer and his companions, who figure in the following narrative, are convinced that this theory does not apply to a motorcycle trip. The anticipatory thrills incident to mapping a touring program are not to be overlooked—there are so many adventures to be lived through in prospect—but in our case it was the actual road experience that introduced us to the joy of living. If this upsets the wobbly old adage above referred to so much the better. We are prepared to stand responsible.

We had no special schedule to follow, no certain mileage to be reeled off each day, when we left Atlanta on June 1 and our road policy was the broadest imaginable. Our aim was simply to derive the greatest possible enjoyment from each day's travel, whether we covered 50 or 150 miles, and our only definite provisions were that we should reach Springfield, Mass., in time to return to New York City on June 20, the date on which we had arranged to sail for Copenhagen, Denmark. We looked forward to big things but we were not worrying about them.

Solving Equipment Problem.

Before taking up the story of our trip northward from Atlanta it may be well to give a few details relative to the equipment of our machines. Details are not always interesting, but they are helpful if given from practical experience. As to the machines, all were twin sevens. A. H. Cooledge mounted a red Indian, E. M. Cooledge used a white Thor and I piloted a blue Indian, with D. Noon Hudson as my tandem passenger. It is worthy of note that the machines made up a combination of the national colors, red, white and blue; this, however, was not by prearrangement. The machines were new, two of them fresh from the crates, and my mount having been run only 250 miles.

On the Way from Atlanta (Ga.) to New York.

Each of us carried a spare inner tube, three extra spark plugs and duplicates of as many of the different nuts and bolts as we could get; also two valve springs each, exhaust and inlet. Emergency valves should always be carried, but we were unable to secure these before starting. For machines with cradle forks, spare rubber bumpers, both upper and lower, should be taken and put on as soon as those in use show any signs of wearing out under the heavy work of the spring action. Some rivets for the grip control are of great value when one

is broken, and a number of these should be taken. Of course chain links and offset links should be carried in goodly numbers. At least two tire sleeves with steel hooks to go under the clincher should be taken for an emergency, and substantial luggage carriers should be fitted. On the rear of my machine a Majestic tandem attachment was fitted and it proved as comfortable as could be expected. We each had a cyclometer when leaving, but two were lost on the way; the third also shook off, but fortunately the rider saw it fall and

PACKING UP "OLD GLORY" ON THE
GETTYSBURG BATTLEFIELD.

One of the Streams Forded in the Virginia Hills.

found it. In this connection it might be said that the brackets for the cyclometers are not sufficiently strong for the heavy work which they have to stand. A. H. Cooleage had a Warner and McKie a Jones speedometer. All machines were equipped with Goodyear tires. A right and left hand pedal spindle should be carried and a good horn is a necessity. As to the lamp, this is entirely up to the individual. The Cooleage brothers had Presto tanks and Old Sol lamps and I had a Vesta electric light and storage battery. The light

question should be looked after very carefully because a good lamp is essential when any night riding has to be done.

The Start from Atlanta.

Previous to putting the finishing touches on our motors we procured a passport to carry us into Russia and Turkey. This is obtained from the Department of State, Bureau of Citizenship, at Washington. The passport had to be approved by the Russian and Turkish consuls before it became valid. For this a nominal charge was made

and the passport itself costs one dollar. If possible, letters to all connections abroad should be obtained before sailing so that they may be used promptly in an emergency. Fortunately for us we had a letter to the American Consul at Copenhagen. We had all joined the A. C. U. of England, in the belief that this would be a great help to us wherever we decided to travel on our machines.

In leaving Atlanta we followed the New York *Herald-Atlanta Journal* route, using a map which can be procured from either of these papers. We had decided to go through Decatur and Lawrenceville, Ga., first striking the so-called "National Highway," about 45 miles from Atlanta. In this way we avoided some deep sand, but missed some good macadam road. The roads were very good, that is, the ordinary clay roads, until we got five miles the other side of Winder, where they had been recently worked and a heavy rain about a week before had made them bumpy. However, this condition lasted only five miles, and after Jefferson was reached the roads were good again. Nightfall found us at Carnesville, Ga., the mileage for the day being 97.2. In view of the late start, we considered this good enough for the afternoon, so decided to spend the night in Carnesville. Before going to the hotel we filled the machines with gasoline in order to be ready for an early start in the morning.

Into South Carolina.

Here the regular charge for supper and lodging was one dollar. We always made it a practice to get an early start in the morning and ride 25 to 50 miles before breakfast. We never ate a midday meal, arguing that we did not care to ride in the hot sun with that exceedingly unpleasant feeling that goes with an overcrowded stomach. This plan is to be recommended to all long-distance riders. And still another important thing that must be impressed on the minds of all riders is that

they should dismount when a fractious team is met; push the machine by, or adopt the most suitable plan in each individual case. The delay caused in this manner is exasperating, but much cheaper in the end, because in case of a runaway it is certain that the farmer will be given the preference in any country courtroom where a damage suit might be heard. It is a strange thing, too, that if a motorcyclist runs over a chicken in a public road and gets caught, it is invariably the prize winning barred rock or the finest buff oppington that he killed.

We got an early start the next morning, Sunday, after a quick inspection of our machines. After traveling 10½ miles further we reached Lavona, Ga., over fairly good roads. We were still too early for breakfast. We were now only five miles from the Georgia-South Carolina State line, and opening up a little we soon covered this distance. On entering South Carolina we were confronted with many different kinds of roads, deep sand for a while, shallow sand, then hard and bumpy clay roads. This condition lasted until we were within eight or ten miles of Anderson, where we struck a very fine clay road and reached the city about 8 a. m. After a wait of half or three-quarters of an hour for two of the boys we had breakfast. At 10 o'clock we were just ready to start back when the others came in, explaining that the bolt holding the coaster brake arm on one of their machines had come out, allowing the arm to wind around in the frame, throwing the rider. It had become so firmly wedged in the frame that the rear wheel had to be taken out to right matters. All the coaster brake makers should put on lock nuts or the assemblers should slightly rivet the end of the bolt so that the nut cannot work off.

Delayed by a Storm.

We were soon off on fair roads, striking an occasional sand bed, dodging ruts, dogs and chickens (the eating variety) until we reached Greenville, S. C. Through this city we followed the car tracks and had little difficulty in finding our way out. We had no occasion to stop in Greenville, so went right on into Spartanburg on very much the same kind of roads we had been having. In Spartanburg we met a number of riders who were out for a Sunday spin. We were advised that just out of Cowpens a bridge on the main road had been washed down a month before and never rebuilt, but by making a detour about five miles to the left we would avoid the ford which was rather too deep for a motorcycle. This we did and the next town was Gaffney. We stopped here for a few minutes pending the outcome of a dark cloud that had been gathering in the skies for some time previous. It soon started to rain and it certainly did a good job, to the entire satisfaction of the farmers in that section. We were forced to stay in Gaffney that night, after covering 136 miles on poor roads.

Monday morning we left Gaffney quite early, little thinking that this was to be our best day on the entire trip. It seemed that the further North we went the lighter the rainfall had been and after much of the familiar "snaking" on the muddy roads, we reached Kings Mountain, N. C., some 23 miles from Gaffney. From Kings

Mountain we had excellent roads as the rain had not gotten that far North. So good were the roads that a challenge from a passing train was accepted and for a number of miles we raced with the train, from Gastonia to Bessemer City. We were beaten, but not much, the train having just left the town as we rolled in. All the way to Charlotte the roads were entirely satisfactory. There are two routes that go into Charlotte. The one we chose was the shortest and crosses the Catawba river on

Atlanta Tourists at Gettysburg.

an old-fashioned ferry at a cost of 10 cents. The other route is some 12 or 15 miles longer and crosses the river on Rozzell's iron bridge. In Charlotte we filled up with gasoline, purchased some piano wire for spare grip control on one of the machines, and went on toward Concord. We had been informed that the roads to this place were very poor, but with the exception of a couple of deep sand beds, we were agreeably surprised to find fair going.

All Kinds of Roads.

From Concord to Salisbury we found some of the most excellent roads on the entire trip and lost no time on them. Another race with a freight train was in order and for 10 to 12 miles we rode at a terrific pace into Salisbury. A few miles out of this city we crossed a toll bridge over the Yadkin river; charge five cents. The road after this is not quite so good into Lexington, but for 12 miles out of Lexington it is excellent, being macadam and oiled. Winston-Salem was soon passed and for six miles out of this place the road surface is atrocious. This part of the road must have been built by Columbus shortly after his arrival here, and repairs on it have been overlooked ever since. After passing Kernersville, ten miles further on, we entered rather wild country, the towns being farther apart and very small. The roads, however, were fairly good and we pressed on with all "sane haste" before dark. There was nothing to watch but the National Highway signs until we crossed the Dan river, going directly into Madison, where we spent the night. Mileage for this day, 186.1. Our machines were rolled into the lobby of the "hotel" and we had a good

supper. We were now in the Blue Ridge mountains with 85 miles of the hardest kind of road work ahead of us.

We had to adjust our chains some time the next day previous to climbing the mountains and decided to ride a few miles out into the country and find a suitable spot, which we did five miles out of Madison. After all adjustments had been made and I had put the last nut on the rear axle, the threads were found to be stripped. Things surely did begin to look gloomy; five miles from an imitation town and at the beginning of the worst mountain on the journey. The spare rear axle we had along was fully half an inch shorter than the useless one, allowing only about three threads on each side to hold the wheel in the machine, and there was no provision for the tandem attachment. We tried attaching the tandem to the stand bolts, but there was nothing doing, so we compromised by taking the mudguard braces off and putting the tandem supports where the braces had been. This left the mudguard to rattle, which it certainly did, with skill and precision. After about five hours' work, we applied at the farm for breakfast, which was cordially furnished to us, the charge being left entirely in our hands.

We proceeded on our way, living in hopes that the one-quarter-inch bolts would hold the tandem, and they proved equal to the task during the entire run to Springfield. The Virginia line is only seven miles from the scene of our breakdown and we made short work of this distance. Immediately on entering Virginia the roads were really bad. The first town, if it can be so called, is Ridgeway, and ten miles more brought us to Martinsville. For the last two miles before entering Martinsville, the road is nothing but a deep sand bed winding along beside the river bed, and with two persons on one machine it could not be ridden with any degree of comfort. Anyway we made it without anything more serious than a few falls.

Fine Scenic Route.

In Martinsville we purchased gasoline and rode on to the next town. Some small railroad stations were passed and fourteen miles out of Martinsville we entered Franklin County, which ought to be noted for its ill-kept roads. Rocky Mount is 32 miles from Martinsville and there are many large creeks to ford. Mountains must be climbed with practically no road at all, and the houses are sometimes ten miles apart. The scenery is wonderful, with the tree-covered mountains on all sides, the season's flowers in full bloom, the mountain streams and wild country. Plenty of time should be taken for this part of the trip by the lover of nature. Eleven miles north of Rocky Mount is a post office station called Synnorsville, and a store operated by a Mr. Ramsey. The latter takes care of all tourists who get caught between towns, and as it was nearly dark when we reached this place we decided to spend the night there. We had an excellent supper and good beds. Mileage for the day, 54.4. This bad showing was due to the trouble we had early in the day.

The next morning we got our usual early start, knowing that we were in for another hard day over the mountains.

(To be continued.)

BLAZE DESERT TRAIL ON MOTORCYCLES

Two Phoenix Tourists Ride Single-Cylinder Machines Through Burning Sand to Los Angeles Over Route Hitherto Unconquered by the Single-Tracker.

MAURICE VALENTINE and Joseph O'Donnell, motorcycle enthusiasts of Phoenix, Ariz., recently added an interesting chapter to the history of the motor two-wheeler in Pacific coast territory by riding from their home city across the desert to Los Angeles. Several intrepid motorcyclists have started into the sandy waste only to return exhausted and with their machines battered and practically useless, but the Phoenix boys could not be persuaded to abandon the plans for their trip. The journey is conceded to be a hazardous one for any vehicle, and doubly dangerous for a motorcycle, owing to the difficulty encountered in carrying sufficient gasoline, oil and water. Not long ago a motorcyclist who attempted to cross the desert along the route of the proposed National Highway was found by an automobile party lying in the burning sand in a critical condition and with his gasoline tank empty.

Undeterred by the stories of these experiences Valentine and O'Donnell, both still in their 'teens, plunged into the desert and came through with flying colors. When they rode into Los Angeles they were not nice to look upon and their machines showed the effects of hard usage, but they had ridden all the way and enjoyed the satisfaction of blazing a new motorcycle trail.

What renders the trip all the more remarkable is the fact that the Phoenix tourists did not use high-powered machines. For such an arduous trip it might be taken for granted that they would ride 7 h. mounts, but they depended upon two Thor 4s to carry them through. The machines were battery-equipped and only one was fitted with a free engine. Few riders, even of wide experience, would have undertaken the journey on twin machines, and the decision to attempt it on singles was looked upon in Phoenix as foolhardy. However, the boys managed to make headway at all

times, although some of their struggles in the deep sand threatened to end in defeat.

Even when their canteens sprung leaks and left them with no water they did not think of turning back out of the desert. Instead they plugged onward through the sand until a water hole was reached. They arrived at this haven exhausted from heat and thirst, but only a short stop was made. With the canteens refilled they again headed for Los Angeles, making slow but steady progress. In many places along their route a motorcycle had never been seen before, and the machines were objects of great curiosity to the inhabitants of the small towns and mining camps. At Harrisburg, a small mining camp, several old-timers who have lived in the camp since 1879, delayed the riders nearly an hour with their questions concerning the strange "two-wheeled automobiles."

The riders followed the old Los Angeles-to-Phoenix race course, passing through Winter's Wells, Salome, Vicksburg, Bouse, Quartzville and Ehrenburg, Ariz., and then through Blythe and Mecca, Cal. From the latter place they followed the railroad to Los Angeles. They started Wednesday morning, July 17, and reached Los Angeles on the morning of July 22, spending the last night of their trip at Pomona, where they replenished their sadly damaged wardrobe.

The difficulties of the trip are demonstrated by the fact that in one day, when fighting their way through deep sand, the boys made only twenty-six miles. Striking better, roads, however, they made from 125 to 150 miles a day on the last days of their journey. Near Blythe the riders met with the only insurmountable obstacle of the trip, when they encountered a stretch of country which had been flooded by a cloudburst. The mud was so deep as to be impassable and they were compelled to have the machines hauled two miles in a wagon. Valentine and O'Donnell remained in Los Angeles several days and then shipped their machines back to Phoenix, returning them-

selves by train. Both are heartily pleased over their success in making the trip, but, as Valentine expressed it, "Once is enough."

WHIPPLE EXTENDS HIS TOUR.

WHIPPLE, the motorcycle man of Chicago, found the tour to Columbus so pleasant that he decided to make a trip eastward before heading for the Windy City again, and at latest reports he was in the Adirondack region. "Whip" found good roads leading into New York State, and in his opinion the route along the Hudson and into the Adirondacks is one of the best in the country. "Never dreamed that a motorcyclist could knock so much genuine enjoyment out of a trip as I have derived from this one," writes the Chicago dealer.

ON 2,500-MILE TOUR.

URBAN KREIDLER, George Goodwin, John Staffer and Chris Weiber, Jr., of Dayton, Ohio, are enjoying a 2,500-mile tour on their motorcycles through the Eastern states. Their route carries them through Cleveland, Buffalo, Syracuse, Rochester, Albany, New York City, Atlantic City, Philadelphia, Baltimore, Washington, D. C., Hagerstown, Wheeling, Columbus and back to Dayton.

AN EMERGENCY REPAIR.

AN experienced rider passes out the following tip: If a small puncture is sustained and no patches are at hand a carefully applied section of a broad rubber band will effect a good temporary repair. As the surface of the rubber band is so limited, the cleaning of both the tube and the patch with emery paper and gasoline must be particularly thorough.

A PROFESSIONAL SCOUT.

HARRY M. NEER, of Jackson, Ohio, earns a good salary by "pathfinding" on his motorcycle for a firm that publishes road maps in Indianapolis.

Stop

Look

Listen

OCCASIONALLY one will meet a rider—I have done so, and I suppose that other members of the brotherhood have—whose motorcycle always looks as if it had just come out of a combined oil and mud bath.

"Your machine hasn't been cleaned lately, has it?" I once remarked to one of these riders.

He did not resent the implied criticism in the least, though I had rather expected he might answer to the effect that it was none of my business.

"Oh, no," he rejoined, "I hardly ever touch a rag to the old tub," and there was actually a ring of genuine pride in his voice as he made the admission. I don't see where the pride could come in, unless on the ground that the machine kept going at all under such treatment, in which case the pride was not rightly his, but the maker's of that machine.

Riders like the above are not common, but they do exist, and really they ought to be legislated out of existence. There are so very many good arguments in favor of keeping a motorcycle clean, and so very few against it! I don't know that my own mount could always serve as an example of what a motorcycle should be, but I realize the importance of proper treatment, and try to live up to my convictions. I aim to give the machine a thorough cleaning about once in so often, depending, of course, on how much I use it and the condition of the roads. Fifty miles done over a good tarvia surface may leave your motorcycle practically as clean as the hour it left the factory, while five miles of mud plugging will make it look like a relic of bygone days.

Grit Is Dangerous.

I have already mentioned the fact that there are many reasons why a motorcycle should be kept clean. Suppose we consider a few of them. First of all, and this ought to appeal to every rider, there is the damage that may be done to the machine. I say *may* be done; the motorcycle of today is so well constructed—in most cases, at least—that very little of the dirt which

settles one the engine and frame can find its way into the bearings or other places where it might do harm. There is no need for any moving parts to be exposed, and usually they are well protected. However, it is not at all impossible for a little grit to work a passage in, and anyone who has had experience knows how disastrous an effect such material has when it is given half a chance. Places that are especially apt to suffer are the bearings of the front and rear wheels, and the chains and sprockets of a chain driven machine. The proper idea is to see that the dirt has no chance at all.

A dirty engine does not cool readily. The motorcycle power plant, depending as it does entirely upon radiation and an air current to carry off the heat, of necessity works at a very high temperature. Up to a certain point the engine delivers more power when hot, but beyond this point the power falls off tremendously; overheating is the main cause why machines sometimes fail on hills. It may be that the incoming charge of gas expands so rapidly within the overheated engine that there is not room for the normal charge to be sucked in. But whatever the cause, an overheated power plant is not a thing to be sought after. Now a thick coating of road dirt and oil lodged in between the flanges will not help the cooling process a little bit.

Cleanliness Boosts the Sport.

The good of the sport in general furnishes another good argument for cleanliness. "Dirty and noisy" are adjectives often applied to motorcycles by their enemies. The noise proposition is not now so prominent as formerly, owing to improved mufflers, as well as because riders are learning that while open exhaust pipes may be permissible out in the country, they are decidedly out of place in cities. It remains to show the public that motorcycles need not be dirty.

There is yet another reason, though perhaps not so important as some of the preceding. A rider should have enough personal pride to let his machine make a decent appearance. A motorcycle is a good

thing; it deserves only the best of care and attention. When I see a machine that is *always* dirty on the outside, I wonder as to its condition on the inside. Carelessness in one way is likely to travel with carelessness in others, and the rider who never cleans his machine probably abuses it aside from that.

The very act of going over the frame and engine with a bit of waste may bring to light matters requiring adjustment or attention, which otherwise might have been overlooked until serious trouble developed. The vibration of the engine often causes nuts to loosen, and such little details may escape the rider unless he forms the habit of looking for them. And there is no time when he is more apt to make discoveries of the kind than when giving the old bus a good rubbing down.

Using a Gasoline Bath.

There is more than one method of cleaning a motorcycle. I have known of riders who left their machines go a month with no attention, and then were satisfied with playing the garden hose on the poor creature for ten minutes or so. That should never be done if one values in the least the good looks of his motorcycle, for it will be almost impossible to get off all the water before the metal begins to rust. And besides the treatment is of little effect from the cleaning standpoint. A fair amount of the dust on a motorcycle is greasy. It is likely to consist largely of dust combined with oil, and cold water will remove oil about as readily as strong language will remove a punctured tube from its casing. The hose method only starts the job, and then it must be done again from the beginning.

I have a definite system in cleaning my machine—that is, when I wish to do a thorough piece of work. Very often I go over the exposed parts and give a hasty polish, but for a real clean-up I follow out different tactics. The tools I employ are a broad, shallow pan, a paint brush, and a quart or so of gasoline. The engine itself, of course, requires more attention than any other part, because of the oil that may

escape via the exhaust valve tappets or main shaft. I place my pan, with some gasoline in it, under the crank case, and then get busy with the paint brush. By its aid I can explore all the inmost recesses and corners back of the valve springs and stems until every particle of oil and dirt is removed. It is also a simple matter to clean out whatever dirt has settled between the flanges. The gasoline trickles down into my pan, and so instead of being wasted, can be dipped up again and again by the brush. To be sure, it evaporates rapidly, and so the supply must be renewed from time to time.

A Novel Milk-Bottle Pump.

I treat the whole machine, wherever necessary, in this way. Where there is no oil to cause the dirt to stick, as on the gas tank, for example, or on the frame, there is no need of using gasoline. A little rubbing with cotton waste, helped out by elbow grease, will do the trick. As the gasoline evaporates from those parts of the machine where it was applied, it leaves a whitish film or coating. This will rub off very easily, however, and after the finishing touches the machine will be spotless.

I have a little device that I sometimes use in cleaning my motorcycle. It is made from a quart milk bottle. In the cork are two holes—one contains a common tire valve, the other a copper tube reaching to the bottom of the bottle. Attached to the outer end of the copper tube is a foot or two of rubber tubing, and at the end of this is a glass nozzle. If you fill the

bottle half full of gasoline, and then connect a pump to the valve and give her a moderate amount of pressure, a fine stream of gasoline can be shot out with considerable force. It is great for cleaning parts of the machine that are hard to get at, but goodness! how it does use up gasoline! I tried it several times, and then concluded to stick to the paint brush method, for, though it was not so much fun as the other, it was much more economical.

More Cleaning Tips.

It is always best to clean a motorcycle when the engine is hot, and the oil or greasy dirt is then in a condition to be easily removed. It is not convenient to clean the machine as it comes in from the road, let her engine run a moment on the stand before you get busy. There is one other tip that I have found to be well worth while in my periodical cleaning up spells. My hands used to be a sight for sore eyes after I had finished, until I hit upon the scheme of wearing cheap canvas gloves. These can be purchased at most stores for ten cents a pair, and they keep one's hands, fingers, and finger nails free from dirt and grease.

Even though it is something of a nuisance and a bother to spend the time required to thus give the old bus a chance to look decent, it is time well spent. You will feel repaid for it by the mere consciousness that you are riding a splendid, shining machine, instead of one whose natural beauties are concealed under an artificial complexion of oil and dust.

RACES AT FORRESTVILLE.

THREE races will make up a Labor Day program to be staged at the Sansbury track in Forrestville, Md. There will be a professional race, one for amateurs and a novelty contest between a motorcycle and a race horse. Riders from neighboring cities have agreed to participate and the members of the Washington M. C. in particular are assisting with the plans.

O. G. Van Lang, of Fort Ogelthorpe, Ga.

BACK FROM BRITISH TRIP.

JACK GIBSON, manager of the bicycle and motorcycle department of the Canada Cycle and Motor Company, Toronto, returned recently from a business tour of Great Britain, when he looked thoroughly into the British motorcycle industry as a step towards the establishment of the proposed big motorcycle plant of his company.

The home for this new big Canadian industry is rapidly nearing completion at the Canada Cycle Works, West Toronto, and extensive experiments are being undertaken by a staff of mechanical experts and engineers, with a view to producing a highly efficient and up-to-date motorcycle.

A NEW OBJECTION.

IT has been announced through the newspapers of Cleveland, Ohio, that the motorcycle tax will be increased to \$3 for the coming year. Heretofore it has been \$1.50, and Councilman Laferty has made the statement that too many machines are already in use in Cleveland and thinks it time to increase the taxation. The club has put a plea against the increase to Mayor Baker.

HENDERSON RIDERS.

FOUR Henderson riders of Binghamton, N. Y., appear in the accompanying photograph. From left to right they are Walter A. Phillips, C. Fred Goetcheus, Walter J. Lyon and Leighton Pratt. Goetcheus is treasurer of the Binghamton M. C. and Lyon is president of the club and agent in Binghamton for the Henderson machine.

FOR OAKLAND DELIVERIES.

FOLKS in Oakland, Cal., who want packages delivered in record time have developed the habit of calling upon Holroyd & McCrea, proprietors of the quick delivery service in which the three vans shown in the photograph are used. Holroyd introduced Oakland to the van delivery idea and found that

the motorcycle system filled a wide breach. As a result the firm is rushed with business, and it is likely that additional vans will be put on in the near future. Two motorcycles are also used for emergency work and messenger service. Holroyd is mounted on the machine at the left and McCrea occupies the saddle of the novel outfit at the right.

RACES AT BIG FAIR.

THE Canadian National Exhibition, the greatest permanent fair on the continent, held annually at Toronto, will wind up this year, as usual, with a big national field day on September 7, when a number of bicycle and motorcycle races will be staged on the exhibition half-mile ring.

FOR FORESTRY SERVICE.

PENNSYLVANIA State authorities are always progressive, and the Forestry Department has ordered fifty Reading-Standard twins for use by the rangers in all the preserves and stations in that State. The order was given to William G. Rhodes, Philadelphia agent for the R-S.

ANOTHER TRACK RECORD

Chapple Lowers His Old Mark for the Mile at Brighton—Albright and Constant Also in Fine Form.

BRIGHTON BEACH, August 5.—Arthur Chapple established a new mile track record at the Brighton Beach Motordrome last night by racing around the three-lap course in 38 $\frac{1}{4}$ seconds, smashing his old mark of 39 seconds by a fifth of a second.

The new mark was hung up in a contest against time. Chapple, on his favorite wheel, clung to the white line without diverging from it a fraction of a second. His ability to cling to the mark really won the record for him. Chapple made the first circuit in 14 $\frac{1}{4}$ seconds, completed the second lap in 25 $\frac{3}{4}$ seconds and the third in 38 $\frac{1}{4}$ seconds.

The four-mile match race between Hartley Thomas and Ray Peck was won by the latter. Peck took the lead in the first heat and won by three wheel lengths in 2 minutes 55 $\frac{1}{2}$ seconds.

A special event not down on the program, a match race for three miles between the amateur riders, Johnny Constant and Johnny French, was won by the former in straight heats. Constant turned the first three miles in 2 minutes and 23 $\frac{1}{4}$ seconds and the second in 2 minutes and 17 $\frac{1}{2}$ seconds.

Johnny Albright won the five-mile professional race. He came back in the second heat in faster time than he made the first heat, spinning over the distance in 3:51 $\frac{3}{4}$, two-fifths of a second better than he had done in the first heat.

Chapple came back later in the night and rode in a two-mile sprint against time, establishing a new track mark of 1:18 $\frac{1}{4}$. He continued his marvelous line-clinging, making the six laps and the crowd accorded him an ovation at the finish.

Hartley Thomas had practically a walk-over for the second heat of his four-mile match with Ray Peck. For three miles it was an interesting struggle, both men alternating in pacemaking up to the final mile. Peck then experienced motor trouble and Thomas drew away and won by nearly a lap in 3:03 $\frac{1}{2}$. This success of Thomas made the honors even, as Peck had previously won the first heat.

Peck, who had trouble with the intake valve of his machine in the second heat, was unable to patch up the trouble for the third and was forced to ride a new machine, Johnny Albright's regular motor.

The change in gasoline steeds did not seem to bother Peck, for he won the race by a quarter of a lap from Thomas. The distance of the third heat was cut four miles to three. The time for the last lap was 2:16.

Albright won the ten-mile handicap, with one lap start, in 6:59 $\frac{1}{2}$. Arthur Chapple, the scratch man, was second, beaten 50 yards. Ferdie Mercier and W. H. Wray finished third and fourth respectively.

BRIGHTON BEACH, August 3.—In the feature event at the Brighton Motordrome tonight Arthur Chapple vanquished Johnny Albright, the Denver flier, in straight heats. In the first heat it was either man's race until the last lap, when Chapple took the lead and won by 10 yards. In the second heat Albright rode neck and neck with Chapple for the entire distance of four miles, but Chapple won out by six inches at the finish.

In the five-mile professional race, Ferdie Mercier, of Brooklyn, was the shining light, winning two firsts and a second place in the three heats. He carried off the honors with thirteen points. W. H. Wray was second with eight points, and F. A. King was the runner-up with five points.

Plenty of excitement was furnished in the 10-mile handicap. Johnny Albright allowed liberal handicaps to his opponents, King, Mercier and Wray, having two laps, and Fleckenstein three laps. From start to finish Albright rode at the rate of 85 miles per hour, lopping King five times, Wray four times and Mercier three times. Fleckenstein was out due to a hot engine.

It was necessary to run three heats in the special three-mile amateur match race between Constant and J. B. French. The former won the first heat by a foot, after a seesaw race. French captured the second heat in easy fashion, and in the final heat Constant took no chances and gained a comfortable lead which he held until the finish, winning by 10 yards.

This was the first night that it was necessary to allow the spectators to use the infield. The grandstand and bleacher seats were filled at 8:15, fifteen minutes before the races were scheduled to start, and the overflow was turned into the paddock where

three hundred people stood during the program. Over 10,000 people were in attendance.

A novel feature was introduced at this meet. A tall pole, at the top of which is a series of varied-colored electric lights, had been erected in the center of the Stadium. At the start of each race the white lights are flashed, and at the last lap the green lights are switched on. At the conclusion of each race the red lights are burned. This system of announcing the progress of each event is unique and is, in addition, to the regular method of announcing by megaphone.

P. M. Mouldew, W. R. Morrison and George W. Beall on their way back to Washington, D. C., from Columbus, on Goodyear tires.

SWARTZ WINS GREAT RACE

In Fifty-Mile Whirl at Denver He Leads Field and Finishes Dazed and Blind.

DENVER, Col., August 5.—Ed. Swartz won the hottest long-distance race ever pulled off on the local saucer on Sunday, August 4, in the remarkable time of 37 minutes 24 $\frac{1}{2}$ seconds for fifty miles. The last few miles he rode practically blind, not knowing where he was going, and only his unequalled grit and rider's instinct permitted him to finish the race without accident. Swartz was unable to see the flag at the close of the race, and continued to speed around the saucer some little time after the race was over, finally coming down on the running board, where he was seized by friends and taken to a physician, where he remained for two hours, until his sight was partially restored.

Six of the original ten entrants faced the starter, but after the tenth mile it was plain the race was between Edw. Swartz, "Slivers" Boyd and "Curley" Fredericks. Swartz took the lead and was only headed on two occasions, in the twenty-sixth and thirty-fourth miles, when Fredericks managed to forge to the front, but in each instance he held his position for only a portion of a lap. Next to Swartz, Boyd made the gamest ride. He had engine trouble in the first mile, and before he got his machine in running order again, the other riders had lapped him. He took up the pace and stuck to Swartz and Fredericks the remainder of the fifty miles; several times he jumped out in front to regain the lost ground, but was unsuccessful until near the close of the race, when he regained so much ground that he was beaten by less than a lap. Ted Hurlbut and Red Parkhurst made their first appearance as professionals and made very good showing, Hurlbut covering forty-six miles and Parkhurst covering thirty-three miles; the latter was forced to stop for repairs in the eleventh mile and lost ten miles.

Squad of Baltimore enthusiasts ready for a recent Sunday run.

NEW COMPANY PERFECTS TWO MODELS

Allied Motors Corporation, Having Enlarged Former Armac Factory in Chicago, Will Market Attractive Single and Twin Types for 1913—A. J. Musselman Heads a Hustling Organization.

THE Allied Motors Corporation, with an up-to-date factory on Carroll avenue, Chicago, is bringing out the new A. M. C. motorcycles, which present many interesting points for the rider and agent. The machines are made in two models, a single, with $3\frac{1}{4}$ bore and $3\frac{1}{2}$ -inch stroke, and a twin of the same dimensions. The valves are all mechanically-operated, the inlets being over the exhausts in a single pocket and operated by overhead rocker arms. The plugs are located on the twin in the front and rear, respectively, of the front

and rear cylinders. Ignition is by either Bosch or Herz magneto, as desired, and the magneto is behind the cylinders, where it gets ample protection. The frame is of the loop type, with twin top-tube. The brace tube is flush with the tank, while the top tube projects.

A new type of spring fork is used. The live members are linked to a traveler which moves between shock and rebound springs on a bar attached to the front of the steering tube. The live and rigid forks are connected by links, at the bottom and the

wheel axle is attached to the end of the live forks. The mudguards are large and have extensions at the sides of both rear and front wheels to prevent mud splashing. A metal tool box is fitted between the seat mast and rear mudguard. The transmission is by flat or V-belt or chain, as desired, and an Eclipse clutch is regular equipment. Bowden wire control is fitted, the sheathes being enclosed in the handle bars. The motors are respectively rated at $4\frac{1}{2}$ h. for the single, and 8 h. for the twin.

The standard coloring will be cream, striped with gold. The tank is panelled off in three sections and the name A. M. C. will occupy an oval in the center. The prices are \$200 for the single, and \$250 for the twin. The output for 1913 will be 2,000 and deliveries will begin in six weeks.

The Allied Motors Corporation has among its officials A. J. Musselman, president; O. F. Frischkorn and Mr. Wagner, sales managers, and Albert Durand, factory superintendent. The factory is that formerly used by the Armac Motor Company with a large addition. It will have the assembling department in the new space leased, with a stock room connecting this with the old building and the offices facing on Carroll avenue.

BENEFIT MEET AT DENVER.

DENVER, Col.—There was a large attendance at the benefit race meet for the flood sufferers, held at the Tuilleries Motordrome on Saturday, July 27, and but for the fact that showers fell throughout the afternoon the program would have been even a greater success. As it was, the relief fund for those who were left homeless by the recent floods in Cherry Creek was materially increased. The racers contributed their services and entered into the events with as much vim and determination as if they had been riding for big purses. Each rider reeled off an exhibition mile before the actual program was started and the efforts of the boys to hang up new figures scored a hit with the crowd. The two-mile open brought the fans to their feet cheering, as Bowen, Swartz and Patterson were bunched throughout the whirl. They finished in the order named. In the final "Curly" Fredericks made an unsuccessful attempt to lower the two-mile time for the track. Summaries:

One-mile time trials, pro, 61 class: Swartz, Indian, $45\frac{3}{4}$; Patterson, Merkel, :44; Bowen, Merkel, :43; Cox, Merkel, :42 $\frac{3}{4}$; Fredericks, Excelsior, :41 $\frac{3}{4}$.

Two-mile open professional, 61 class: Bowen, Merkel, first; Patterson, Merkel, second; Swartz, Indian, third. Time, 1:28 $\frac{3}{4}$.

Two-mile time trial, professional, 61 class: Fredericks, Excelsior. Time 1:21 $\frac{3}{4}$.

HAL DAVIS, a Phoenix (Ariz.) motorcyclist, is on his way to Chicago on his machine.

HELD POSTPONED RACES.

PORTLAND, Ore.—The races of the Portland Motorcycle Club, which were to have been pulled off on July 21, were postponed to July 28, owing to a heavy rain on the date originally chosen. One of the most interesting events was the economy contest, each rider being furnished with a soda pop bottle full of gasoline and allowed to go on the track to see how far he could ride. W. P. Brush, Merkel 4, took first place by going $5\frac{3}{4}$ miles. There were a number of laughable features about this event owing

Coffman and Ex-President Hamilton Talking it Over.

to the number of machines which had to be towed in from different points of the track.

The most sensational riding of the day was done by Harry Brant, Thor 7; he negotiated a mile in $54\frac{3}{4}$ seconds.

THE Prest-O-Lite Company, of Indianapolis, are opening a Canadian factory at Merriton, Ont.

FAVOR THE MOTORCYCLE.

MINNEAPOLIS, Minn.—The city council at Minneapolis is contemplating the purchase of a motorcycle for the underground wire inspector. An automobile was first thought the best thing to insure prompt inspections, but aldermen have been looking into the question and have found that the motorcycle will give as good or better service.

WORK has been started on the construction of a running track inside the new motorcycle bowl at Newark, N. J.

Mrs. "Doctor" Patterson Sizing up the Columbus Crowd from Aloft.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

THAT motorcyclists are taking deep interest in the Improvement Contest now being conducted in these columns, is evinced by the numerous suggestions received daily. Most of them are essentially practical, and all are worthy of close attention by those who are devotees of the two-wheeler. The first series of suggestions is published herewith. The conditions of the Contest are reprinted below for the benefit of those who have not read the original announcement in the June 27 issue of *MOTORCYCLE ILLUSTRATED*.

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the best twelve suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

IMPROVEMENT IDEAS DESCRIBED AND ILLUSTRATED

REAR SPRING CONSTRUCTION.

1.—Spring rear construction for motorcycles. A is a jointed stay, B a brace from A, and C a clutch on the countershaft. The sprocket is indicated at D, and E is the pedal-crank aperture. A quarter-elliptic spring is fitted at F, its shackle is G, and I is the rigid rear stay. H is the rear sprocket and J the

coaster-brake arm. Countershaft sprocket and rear sprocket to be the same size. The arrangement will tend to keep the wheel on the road for all kinds of going. Contributed by Peter Bissett, Winnipeg, Manitoba.

ONLY FOUR NUT SIZES.

2.—Four sizes of nuts and bolts only for use on motorcycles is another suggestion. For these four sizes, two double end or "S" wrenches would suffice instead of carrying a monkey or like wrench. Will tend to do away with the too frequent employment of pliers. Idea submitted by W. A. Siegbahn, North Tonawanda, N. Y.

FOR LIGHTING GAS LAMPS.

3.—Device for igniting gas-lamps by magneto. M is the magneto, and the switch is represented by the long cylinder. This latter has an outer casing of insulating material with an upper lining of metal (shown black) and contact plates C, C. A piston has a metal head and spring on its stem, the latter tending to keep the piston in midposition. K is the switch knob, and J the lamp burner. A spark gap G is fitted close to the beak of burner J and another opposite the first, the wire is then led to the frame F. S P is the spark-plug, and the various wires are W₁, W₂, W₃, and W₄. With the piston in central position the current goes from the magneto direct to the spark-plug. On pushing the knob K inward, the piston connects magneto and burner contact C and the spark jumps the gap G, igniting the gas at the beak. On pulling the knob K out-

ward, the magneto is short-circuited through wire W₄ to the frame F. Contributed by Peter F. Lindemann, Bronx, N. Y.

A COMBINATION STAND.

4.—Front wheel stand acting as stand and crankcase guard. Left-hand view shows bottom (or front) view of stand, which hinges at H and has a foot at B. Hinges to forward part of crankcase, protecting the front of case from shock and the sides

A.C. CAMERON.
COMBINATION
STAND.

also by diagonal braces. Full lines show wheel off the ground when tire repairs are needed on the road and preserves the front tire from supporting the motorcycle when in the garage. Manufacturing cost small and design is adaptable to any machine. Contributed by Alan C. Cameron, Riverside, Ill.

GASOLINE GAUGE.

5.—Gasoline gauge fitted to tank; glass tube is fitted into a recess in the tank where it

is protected from damage in case of shock. Contributed by J. R. Ritchie, Spokane, Wash.

6.—Front wheel stand contributed by same writer. Fits over axle ends and attaches to mudguard by clip or thumbscrew.

GASOLINE STRAINER.

7.—Gasoline strainer; to be attached directly to carbureter. B is a brass tube, one inch in diameter and 6 to 8 inches long. A is a chamois-skin strainer held to the part D by nuts, etc. The skin is bent downward as at F to prevent leakage past it. G is the connection to the gasoline tank, and H the

GASOLINE STRAINER.
RALPH W. GREEN.

screwed connection to the carbureter. E is the base cap and is integral with D. The fitting is shown in the main view where M is the carbureter and S the fuel shut-off cock. Contributed by Ralph W. Green, Modesto, Ill.

Green also suggests the employment of Reynolds noiseless chains for transmission instead of the regular roller type. The sprockets in the final drive should be as nearly as possible the same diameters, and the free-engine device should be located in the rear hub.

SHIELD AND DRAUGHT-PRODUCER.

8.—The whole of the motorcycle power-plant is enclosed at the sides by sheet-metal shields, asbestos lined. The ends of the upper sections are flared to allow the air to reach the cylinders, and when riding the air is forced between them, causing a positive draught. The lower sections enclose the crankcase, protecting it from dirt, etc. The shields further protect the rider from oil, etc., and the motor sounds will be slightly

deadened. Estimated manufacturing cost, \$4 to \$5. Contributed by Geo. T. Stansbury, Jr., Cincinnati, Ohio.

VARIETY OF IMPROVEMENTS.

9.—Double stem handlebar fastening in place of the usual method of fastening is suggested as an improvement. Spring seat posts to be extended to include the pedaling gear and pedals, so that the rider would be more comfortable and not have to take the motions through his knees. The ball valve in many oiling devices to prevent sucking back should be replaced by a spring-loaded mushroom valve. The magneto should be mounted on the motor-base, not on anchor plates, as by this method there would be no danger of the magneto gearcase working loose. Bowden wire controls to replace other devices, eliminating loose lugs, easily rusted control rods and brazed lugs. Horizontal bracing for front "dead" forks would be more desirable than the V-shape bracing. Metal tool boxes to be made narrower so as not to weaken the frame. Mufflers to be in rear of motor and not at front. Suggested by Chas. Geasland, Platteville, Wis.

NOVEL MUD-PLOW.

10.—For riding where there is much clay or mud, a plow fitted under the mudguard is suggested. The device is made of two pieces forming an acute angle and projecting within a half inch or slightly closer to the tire. The mud coming against the angle, is thrown clear and permits the wheel to revolve freely. Contributed by Norman S. McEwen, Nashville, Tenn.

FRONT WHEEL STAND.

11.—Front wheel stand; fitted in the same manner as the regular rear stand. Drops behind the front wheel and raises the machine when pulled backward. Useful when front tire needs attention and in garage, keeping both tires off the floor. Shoulder on front of leg fits under axle pin when stand is in service. Contributed by Roderick G. Drysdale, Westfield, Mass.

FRONT WHEEL STAND.

SPACE-SAVING HORN.

12.—Horn, fitting to top tube or other part of frame. A is the bell, B the plunger, C the plunger-barrel, D the straight and E the

crook. K, K, K are fastening devices. A very novel arrangement. Contributed by Alfred T. Mason, Pittsfield, Mass.

ADJUSTABLE MUFFLER.

13.—Adjustable muffler. Front portion similar to that of regularly fitted mufflers; rear portion fitted with baffle plates adjustable to give two degrees by their position in the muffler cylinder. Contributed by J. A. Ritchie, Spokane, Wash.

FRONT WHEEL STAND.

14.—Front wheel stand adaptable to any machine. Made of flat stock $\frac{3}{4}$ inches wide, and long enough to reach over top of wheel from side to side. Holds in ends fit over fork bolts. Two flat pieces are riveted to the loop to form wide base and keep stand steady. Contributed by Frank E. Waelder, Mannibal, Mo. Not illustrated.

TROXEL SADDLES

would be used exclusively as equipment on all motorcycles if it wasn't for the fact you can buy inferior saddles so cheap.

The poor, unsuspecting rider who takes what he is given is the victim of circumstances.

The temptation to save on equipment plus the agent who forgot to specify—lands you Mr. Rider, on a saddle that does everything "but give satisfaction."

The leather used in the top is one big item to look into. Just look at the under side of the leather top. If the color is reddish, it is Hemlock tanned leather and will not stand abuse—Cheap leather. If the reinforcement is not in the top, "same as all Troxel tops are reinforced," there is another case of cheapening the saddle to make a price so the inferior saddle has a chance to get on a machine.

Look into the saddle construction and remember this.

All Troxel "No Bump" saddles are guaranteed to give satisfaction.

Tops are made of Finest White Oak Tanned leather, reinforced with another white oak tanned lining. That is why Troxel tops stand the abuse of rough riding and also why

Troxel Saddles cost more money.

Riders of a few machines that do not equip Troxel saddles gladly pay more money to get a Troxel saddle on their machines.

Specify the Troxel "No Bump" Saddle and eliminate all future trouble. Supplied as regular equipment on every Motorcycle built almost.

of Congress, March 3,
1879.

H. N. CONDUCT,
Secretary

State
Rivalry
Will
Help.

Reference to the revised sections, published elsewhere in this issue of **MOTORCYCLE ILLUSTRATED**, will satisfy the inquirer that the object of the revision is not only to add to the duties and responsibilities of State Commissioners, but also to permit of their exercising more power and practically as much initiative as they desire. Right here is the crux of the change, namely, in that it should be productive of clear-cut and wholesome rivalry between the different State organizations to show, each year, the best results, not only in the way of adding to the membership of the F. A. M., but—and this is of vastly more importance—in the measure of the co-operation given the President, Board of Directors and the National Committees. The latter are especially in need of such assistance, and in position to profit by it to a wonderful extent.

Drawing
Lines of
Authority.

Thus far no National official has shown the slightest disposition to exceed his authority. Just the contrary has been the case and, if the average President, Director or Committee Chairman is open to any criticism, it would be on the score of his having failed to exercise enough authority. And there's a reason, viz., lack of local co-operation. It is this very circumstance which the change in the basic laws of the F. A. M. are intended to improve. It is only natural to suppose that the widening of State opportunities will result in greater State activity. In any event, the new arrangement involved makes clear the old definition of the duties of every

official, from the National chief executive down to the local commissioner in the smallest town in which the F. A. M. has representatives. Furthermore, based upon the Constitution of this country, that of the Federation does away with the possibility of confusion by stating the principle that the State organizations may, within their respective jurisdictions, exercise all powers and assume all the responsibilities which are not expressly delegated to the officers of the National body. The duties of the latter, besides being clearly set forth in the Constitution and By-laws, are also in a large measure established by practice, making it just so much easier to draw the line of demarkation between National and State authority in general and any case in particular.

TWO CADIZ ENTHUSIASTS.

JAMES TAGGART, of Cadiz, Ohio, who appears in the accompanying photograph with his Henderson four and a girl friend, is a full-fledged enthusiast. By way of proving his claims in this direction he states that evening spins of 50 miles with his fair companion are quite common. Four cities, Wheeling, W. Va., Dennison, Urichsville and Steubenville, Ohio, each lies about 25 miles from Cadiz and the pleasure jaunts are usually made to one of these points. Referring to the enthusiasm of his companion Taggart states that she has repeatedly declined invitations to ride in her brother's 40 h. automobile when there was a motorcycle trip in prospect.

M. C. PARRISH, a Merkel rider of Tacoma, Wash., has already ridden his machine 14,000 miles.

Stirring
Up Local
Workers.

The new order of things adds materially to the importance of local commissionerships. In the future, these promise to be more than empty titles. State commissioners, appreciating that they will be held responsible, may be depended upon to make the best possible selections, and they will have less difficulty than heretofore in inducing their appointees to accept office. We confidently look forward to big accomplishments by hundreds of local commissioners each year. They will be better situated for doing things. For the F. A. M. as a body, with the right kind of co-operation on the part of State and local commissioners, will serve its members to such advantage that it will be no great task either to get new members or hold a goodly proportion of the old ones. And by the loyalty of the year or two-old member is the real value of an organization measured. Rendering service such as was out of the question without efficient local help, the National committees and the Touring Bureau will have many an opportunity to demonstrate that the F. A. M. has really something valuable to offer in return for that dollar a year. Not one, but a dozen answers will be ready for the fellow who wants to know what he is to get in exchange for his hundred pennies per annum.

President
Patterson's
Policy.

President Patterson has already made it plain that it is his intention to continue the policies of his predecessors. He announces the appointment of four of the five present committee chairmen, including Dr. Thornley and E. M. Estabrook. The problems of the new Constitution, as well as of the new competition rules, will be worked out by those who favored the changes. It is but fair that they should assume the responsibility.

MATCH RACE CALLED OFF

Cox and Fredericks Will Meet Again Soon
On Denver Bowl to Settle Question
of Supremacy.

DENVER, Col.—The first Sunday races that have been held without the usual rainstorm were staged at the Tuileries Park on July 28, and a large crowd witnessed the sport. Close finishes characterized the events.

The feature race of the afternoon and the event in which the greatest interest centered was a two-mile match race between Jim Cox and "Curly" Fredericks. These riders have been bitter rivals for months and repeated efforts have been made to get them together, without success, until yesterday. Then they made two attempts to settle the question of supremacy, but the ending of each was so unsatisfactory that neither rider was awarded the palm and the race will be run off at the next meet. In the first match race they rode elbow to elbow until the last lap, when Fredericks' machine broke down. The judges, by previous agreement, decided to call it no race and ordered the event run over. After Bowen had defeated Swartz in hard fought match race, Fredericks and Cox again took the track and as in their former race, they battled desperately for one and a half miles and then Cox's machine broke down. In each instance the race belonged to either man up to the time of the breakdown.

The final event on the program was a six-mile open race in which six riders competed. They got off in a bunch and four riders led at different times, but Bowen managed to pull out in front on the home stretch with Swartz and Cox following in the order named. Summaries:

One-mile time trials, professional, 61 class—Ed. Swartz (Indian); time, :43½. L. Bowen (Merkel); time, :43½. Jim Cox (Merkel); time, :41½. Curly Fredericks (Excelsior); time, :40½.

Two-mile match race, professional, 61 class—J. Cox (Merkel), Curly Fredericks (Excelsior); called off in second lap of second mile.

Two-mile match race, professional, 61 class—L. Bowen (Merkel), E. Swartz (Indian). Time, 1:28½.

Two-mile match race, professional, 61 class—Curly Fredericks (Excelsior), Jim Cox (Merkel); called off in second lap of second mile.

Six-mile open professional, 61 class—Bowen (Merkel), Swartz (Indian), Cox (Merkel). Time, 4:25.

ONE of the largest fruit buying firms in Toppenish, Wash., has adopted the motorcycle for making quick trips from the city to the orchards throughout the year.

MOTORCYCLE IN WHITE PLAGUE FIGHT

Wisconsin Anti-Tuberculosis Association Makes Novel Use of Single-Tracker in Rural Campaign—Carries Stereopticon Kit

THE utility of the motorcycle for campaigning and lecture work has been practically demonstrated by the experience of the Wisconsin Anti-Tuberculosis Association, which recently started a field worker on a tour of the state, carrying a stereopticon machine and an exhibit of seventeen charts, together with his own camping kit, on a Harley-Davidson

motorcycle. The machine was donated to the association for this work. At first somewhat an experiment, this venture has proved to be a success. It has special value in this work, as it makes country campaigning practical.

Surveys in Wisconsin and elsewhere have demonstrated, and it is generally recognized by those engaged in combating the disease,

that there is almost as much, if not as much, tuberculosis in the country as in the more congested districts. Because no means formerly tried have made it possible to reach enough people in a day, the educational campaign for the prevention of the disease has not been extended into the rural sections. With the motorcycle, Mr. Werle, who is doing the work in Wisconsin, reaches as many people in a day among the rural population as he would by an ordinary railroad tour.

For illustrating daylight talks, he carries a portable exhibit of seventeen charts. Early in the morning he displays them at a creamery, talking to the farmers bringing in milk. By noon he has gathered an audience in some small town perhaps several miles away. Distances can be covered so rapidly that he gets to another village in time to get a good rest before the stereopticon lecture in the evening.

When the weather permits, even the evening lectures are given out of doors. A McIntosh stereopticon is operated from the luggage carrier of the motorcycle, the light being supplied by the same gas tank that runs the head and tail lamps for night traveling. The pictures are projected against a white curtain which is carried as part of the equipment.

For pleasure as well as economy, Mr. Werle carries in addition to the exhibit and stereopticon machine, a compact camping equipment consisting of a silk lumberman's tent, blankets and a few necessary cooking utensils. With this equipment he is independent of hotels as well as railroad schedules. Only when one considers that one-half of the population of Wisconsin is rural, and greatly in need of education along the line of sanitation, can the significance of this work be appreciated.

JERICHO TURNPIKE OPEN.

AFTER having been closed for nearly two years at points east of Woodbury, the Jericho Turnpike, which is the main highway of the north side of Long Island, was opened on July 12. The State, at a cost of more than \$10,000 a mile, has transformed this famous old country road into an ideal motor-way. The new section is 14 miles long, extending from the Nassau county line to the bridge over the Nissequogue river at Smithtown. Eleven miles are of concrete foundation with tar and gravel coating, and the last three miles are of asphalt-macadam construction.

The Turnpike is reached from New York by way of the Hoffman Boulevard and Hillside avenue. It runs from the village of Queens through Floral Park, East Williston, Jericho, Woodbury and Commack to Smithtown. Beyond Smithtown the country roads are in fair condition, enabling the tourist to reach St. James, Stony Brook, Port Jefferson and other North Shore towns.

There is only one railroad crossing between East Williston and Port Jefferson, a motor run of forty miles through a picturesque wooded country.

TIFFIN, Ohio.—The Police Department of Tiffin has been provided with a motorcycle and Chief Meyers is riding it.

SETTING GOOD EXAMPLE.

AT its last meeting the Maryland M. C., of Baltimore, went on record against the open muffler, tank-riding and unnecessary speeding. The club has agreed to assist the local authorities in enforcing all the traffic regulations.

UNITED STATES government, customs department officials are now using motorcycles in the Port Townsend and Puget Sound districts.

Sturdy van used by the Bicycle and Motorcycle Garage in Alameda, Cal.

BOSTONIAN'S TALE OF FLYING TRIP

Plenty of Road Variety and Some Genuine Thrills Mark 900-Mile Tour Which Traversed Four States in Four Days

By A. W. Devine.

FOR some weeks I had been looking forward to a trip from Boston to Wilkesbarre, Pa., and when my new Excelsior arrived I lost no time in completing my plans for the journey. I decided to take to the road on May 13, and despite the fact that the fateful day proved gloomy and misty I would not tolerate further delay. Accordingly I packed my suitcase, oiled my machine carefully, greased all exposed nickel parts and chugged out of The Hub, prepared for anything that might develop. Shortly after 2 p. m. I rode out of Boston and before I had covered five miles I did not mind the drizzling rain. In fact, I derived a sort of satisfaction from making good progress in such weather.

My trip was without incident through Marlborough, Worcester, Springfield and Hartford, a stop being made at the latter place for gasoline. At this point I figured that my machine had consumed about a gallon of fuel, and I had traveled in the neighborhood of 96 miles. On leaving Hartford it was necessary to cross a sharp bend in the car tracks, and I did not notice how high the rails were until I went down in a heap. Then I had a better

chance to observe them. I should have been warned, by the way, for two years previously I had fallen in exactly the same spot and under the same weather conditions.

Night Stop at Meriden.

I reached Meriden, Conn., at 7:30 p. m. and decided to put up there for the night. I had experienced no machine trouble since starting, but I was a trifle tired and the weather was not inviting for night riding. In the morning I turned out at 6 o'clock and after replacing several nuts which had been lost from my luggage carrier I filled my tanks and got under way again. Out of Meriden I rode in a drizzling rain, but several hours later the sun came out and I made better time. On nearing Portchester I was obliged to ride between car tracks, with the road torn up on my left. Suddenly I came upon a ditch, crosswise in the street and about a foot and a half wide. I could not avoid striking it, but luckily my machine fell across the opening and did not drop into the trench, which was about eight feet deep. The only damage was a dent in my front rim.

Throughout the day I appeared to have a jinx with me. As I was puffing out of Portchester a big automobile came tearing out of a side street and cornered me so that I was obliged to make a sharp turn off the road.

The mudguard of the car struck me, however, bruising my arm and bending one of my pedals back flat against the machine. I made a hurried repair and took to the trail once more.

Over Good Jersey Roads.

I arrived in New York City at 12:30 and rode via Seventh and Fifth avenues to the Twenty-third street ferry, where I embarked for Jersey City. On landing I traveled over a mile of cobblestones, then struck a piece of boulevard and finally ran into more cobblestones. This was poor going, but after passing through Newark I had a good macadam road all the way to South Orange. There I struck the "Seven Bridge Road" and my troubles were over for a time. The roads were fine through Chatham, Madison, Morristown, Wendham, Chester and German Valley. Between the latter place and Hackettstown I had a hard mountain to climb but I went up without difficulty. This grade has a sharp U turn which caused me to slow down to seven miles an hour. However, I stuck to my saddle.

From Hackettstown I had good roads to Delaware and Myer's Ferry, but from this point the route was rough and sprinkled with large stones to within a few miles of Delaware Water Gap where there was easy going again. I passed through the Gap without stopping and rode on to Stroudsburg where I put up for the night. Just before reaching Stroudsburg I had a bad fall while taking a corner too fast. My brake seized when I applied it and when I awoke I found myself cut and bruised in a dozen places. I also came out of the spill with a sprained ankle. I met two automobile parties at the hotel in Stroudsburg and managed to forget my troubles while we compared notes on the roads we had traversed.

Riding Under Difficulties.

On Saturday morning I turned out at 6 o'clock and found that my ankle had swollen until I could hardly walk. By lacing my shoe tightly I was able to make a start and at 9:30 I pulled out of Stroudsburg. I had 20 miles of rocky roads to Pocono Summit, but from this point I found 16 miles of good slate road to Tobyhanna and Blakeslee. From Blakeslee to Bear Creek the roads were in wretched shape, but the last ten miles before reaching Wilkesbarre was much better. I arrived in Wilkesbarre at 12:30 and spent the afternoon in riding around through the neighboring towns. I found the scenery very pleasing but on Sunday morning I was glad to start on the return trip to Boston. I went back over the same route and when I pulled into Norwalk, Conn., that evening at 7:30 I was mighty tired.

During the day I had ridden through four states and over rougher roads than I had ever traveled before, for after riding on Massachusetts highways the roads of Pennsylvania gave me a rude shock. On the following morning I dropped in to see Stanley Kellogg at Bridgeport, and then rode on to Springfield, where I arrived at 2 p. m. From this point I made the final sprint into Boston in a little less than three hours; it was a jump of 97 miles. I had been four days on the road and had covered 900 miles so that I could find no room to complain as to the outcome of my outing.

RIDING AROUND THE WORLD

Greek Motorcyclist Starts on Tour with Which He Hopes to Establish a Record.

AUGUST KIAKAKAROS, a native of Karintine, Greece, who has been in this country for two or three years, started recent-

ly on what he hopes to make the longest motorcycle trip on record. Kiakakaros, who has been living in Springfield, O., for some time past, will make a leisurely tour around the world, combining pleasure and business. He received word a few weeks ago from the old country that he had fallen heir to a large estate which will make him independent for the remainder of his life. His one ambition has been to see the world, and the motorcycle is his choice of a vehicle.

Kiakakaros purchased from Henry Hornberger, Springfield agent for the Flying Merkel, a 4 h. belt-drive Merkel machine on which he will make the trip. He spent a week at the Flying Merkel factory at Middletown, Ohio, making preparations for his long journey and is now riding eastward. His route will take him to Dayton, Columbus, Cleveland, Erie, Buffalo, Albany, Poughkeepsie and New York City, and after arriving in New York he is undecided whether he will take a steamer direct to Europe or start back across the country, taking the steamer from San Francisco to Japan.

In addition to making the trip for recreation, Kiakakaros will endeavor to raise funds from his countrymen for the purchase of motorcycles to be used in the standing army of Greece. A fund has just been raised by wealthy Greeks in this country to purchase aeroplanes for the Greek army, and Kiakakaros will undertake the job of supplying the army with motorcycles.

A novel trailer used for quick deliveries by an ice cream company in El Reno, Okla.

ENGLISH NOTES

BY BRITISHER

T. T. Race Assured for 1913—Obstacles Overcome by Riders in Scottish Trials—
Pointers on a British Spring Frame and the Matchless Six-Speed
Gear—A Special Lady's Machine.

THE Auto-Cycle Union has sized up its racing accounts for 1912 in a big hurry, and ascertained the loss, which fortunately is not extensive. As a consequence the secretary announces that a race will definitely be organized for 1913, whether the Manufacturers' Association signs an abstinence bond or not. This is healthy independence. A committee will start work upon the new conditions immediately after the August vacation, and the rules will be out in plenty of time for foreign competitors to get some genuine ginger engines through. We hope to welcome a really formidable American team.

Scottish Endurance Trial.

MUCH interest was aroused in the annual six days' trial of the Scottish Club, which ever since its inception has been so violent in character that a timorous trade has done its best to boycott it. In the badness of the roads it traverses, it probably presents close resemblance to an American trial, for hundreds of miles are over moorland sheep tracks, conducting the riders across country from one range of hills to another, in the effort to find steep precipices to climb. In the 1910 trial there were two hills of which no machine entered could make a clean ascent, and this year beats all records. The worst hills were as follows:

Amulree, a two-mile ascent, of a boulder-strewn, grass-grown character, beginning with a right angle turn over a humpbridge,

The BAT Two-Speed Gear.

continuing with half a dozen "steps" of 20 per cent. grade, culminating in a double V bend, the twists being within 10 yards of each other along a track 5 feet wide, with inside grades of 33 per cent. and grades of 25 per cent. measured in the center of the alleged "road," concluding with 200 yards of 16 per cent. grade. Only a trick rider on an immensely powerful machine

could be expected to climb this first shot.

Rest and Be Thankful, a four-mile climb of a long steep gorge between two ranges; the grade is nowhere worse than 12 per cent., but the gorge forms a funnel down which a gale is permanently raging, and good engines have a way of growing tired

ere the summit; just at the top there is a wicked V corner, on which the wind hits you fair and square, holds you up, and upsets your mixture.

Cairnwell Summit, the highest road in Great Britain, starts with a mile of 10 per cent. on a narrow sludgy track, usually very rutty and heavy going; halfway up comes a double Devil's Elbow—most men hit the bank at the second twist—above this, a mile of 10 per cent. gradient, and more than a capful of wind. As you cross the plateau, you see deep snow lying far below, even in August, and as you drop down in the far valley, there is a piece where you feel like having two fellows to hang on to the tail of your machine; no car has ever climbed up here, and there is a ravine and skewbridge waiting for the unfortunate whose brakes slip.

Cairn o' Mount, two miles of straight heavenward travel on a wicked gradient. Halfway up the road crosses a sandhole, into which the foundations are always falling. This patch is always refilled with soft rubbish once a fortnight or so, when the road is open in summer; as you tear up the hill, you sink in it up to the hubs, and have to push past—lots of men waiting to earn a dollar helping you; when you are past it, the bother is to get restarted; at the top there is a double Devil's Elbow.

Gruinard, a wicked little climb by the beech of a bay at the other end of nowhere; you see it coming just in time, and accelerate to hit three feet of drift sand at the crook of the bay; out of the sand the grade begins, and starts round a double V bridge; when you can beat the bridge

you sail up nicely to a blind corner; the blind corner opens into a crack in the rock-wall, right angles, through which the gale hits you kerflop.

Poolewe, one of those sneaky hills which look like level, but is really 1 in 6; a narrow road climbs up between steep walls of rock—always looks as if it were finishing, but never does; takes the crack men unawares, and fetches them out of the saddle like greenhorns in a steeplechase.

To really enjoy these hills you should try them in wet weather, when you learn something about beltsip, and in the Highlands it's always raining, except when it snows.

Some Cute Tips in My Outfit.

MY outfit for this run cost me some thought, and one or two of the tips are worth a comp's time. The first was the necessity of lubricating my three-speed hub with very special oil every 100 miles, and the absence of any container for such oil. I got a little leather holster, designed to store half a pound of carbide, emptied the carbide out of the inside tin, swilled it dustless with gasoline, poured in the oil, hammered down the press-on lid, and there I was. Next found the pannier toolbags on my carrier were only large enough to hold the main tool kit, spare plugs, valves and three-speed gear replacement set. Went to a cycling store and got two small tool bags, price 30 cents each. Put tire repair kit, gaiter and one-minute levers in one

Matchless Rear Wheel Adjustment.

bag, belt repair kit in the other (spare fasteners, punch, knife, screw-drivers and bolts/panner), strapped both wallets to handlebar. Found my spare tube case was lost, stolen or strayed. Furled spare tube round handlebar, securing by looping tab of butt over tire valve. All serene then.

Three-Speed Hubs Under Racing Test.

IHAD an interesting experience last week. I was in the running-shed of one of our premier factories, when the race-crates came in as returned from the T. T. races in the Isle of Man. "Say, old man," quoth I to the chief, "let's see the inside

of those jiggers?' We stripped the crate off one machine which had finished very high up, and I started with the hub. Mind you, this three-speed hub weighs no more than 10 pounds and is only 5 inches in external diameter; against this, it had been used very recklessly in the race; whenever the rider approached a bad corner he kept on full throttle till the last moment of safety, then smashed in second gear and clapped on both brakes; rounding the corner, he accelerated like a skyrocket on second gear, and then shoved in top gear with his knee, never lifting the valve or de clutching. Well, the gear was perfect—the toolmarks were as if it had never been

Midget Bi-car, an English model designed especially for women riders.

used at all. Then we turned to the engine. The big-end bearings were a trifle worn; the wristpin was perfect; the cams were unworn; the ballbearings of the crankshaft were perfect; the combustion chamber was heavily carbonized, and the exhaust valve seating would have been non est in another hundred miles, for a sixty-pound spring had been used on a "ring-valve," i. e., a valve of nickel steel with a recessed face, into which a ring of a secret alloy is spun by a secret process, to provide the actual working face. "Put a fresh cylinder on that engine, Jim, before she goes out," said the chief laconically, and that is all there was to it. But the condition of that light, compact little hub-gear was a revelation.

A British Spring Frame.

I SUBMIT a cut of the only spring frame which has ever made good on the British market; it is fitted to a machine named the Bat (best after test), which has utilized this frame ever since 1903, and experience has been unable to improve it. It will be seen that the front forks are hung on spring levers of a type giving rather longer leverage than is obtainable by concentrating springs at the hub, and that the saddle pillar and footboards are also slung on springs. The one drawback to the design is that it is not suited to very tall riders, as the saddle is nonadjustable and set close to the footboards. The special magneto drive will be noticed. It was introduced before the days of waterproof magnetos, and designed to permit of carrying the magneto inside the tank and out of reach of wet and dirt. This frame gives very silky riding. I also append cut of the gearbox attached to these machines, which is an excellent example of the countershaft gears which are slowly carrying all before them in Great Britain.

The Collier Bros.' Six-Speed Gear.

I APPEND herewith detailed drawings of the gear with which the famous Collier Brothers win road races. They started designing with two main factors in view. The first was that an ordinary two-speed gear was a handicap in road racing, because the gap between the ratios meant an unnecessary sacrifice of speed whenever gear changes were necessary. The second was that a horizontal or lateral motion of the gear control was dangerous at high speeds. Consequently their plans took the line of 1, a to and fro control, for safety at speed; 2, an expanding and contracting engine pulley, to afford short step gear ratios; 3, a movable back wheel, to take up belt slack. This practical headwork is characteristic of all the Colliers do. One sketch shows how the back wheel is movable by duplex chainstays acting on a lazy tongs principle; though the sketch does not show the point, there is an extra two inches of movement over and above what is required to suit the belt tension to any given pulley diameter; this enables the Colliers to tighten the belt in a race, if it stretches, without dismounting to cut it. Notice the cleverness and simplicity of the notion by which the angular motion of the pulley lever is converted into circular motion on the pulley itself, by means of a short bit of chain working over sprocket teeth cut on the pulley sleeve. The cuts of the internal pulley and sleeve cams show how the pulley is contracted and expanded; notice that the pulley barrel contains double thrust bearings, so that there is no end thrust on the engine itself.

A Special Lady's Machine.

ENGLISH girls, with few exceptions, are not partial to astride riding, and the Midget Bi-car is a good illustration of a machine designed especially for skirt-riding. Finding that the standard tubular open ladies' frame shows a tendency to whip and buckle, the inventor designed a novel frame of hollow steel girders, with spring-slip engine shields, enclosing cylinder and belt after the fashion of the bonnet on a high-grade automobile.

VALIANT AS A FLYER.

MANY motorcyclists will no doubt be surprised to learn that Frank Libbey Valiant, assistant sales manager at the big Merkel plant in Middletown, Ohio., was at one time a bidder for aeroplaning honors, but it is a fact that Val even went so far as to make two successful flights. About that time he decided that selling motorcycles was a far safer occupation and just

about as pleasant as flying, and he turned away from the sky machine to one that is credited with being "the next thing to flying." However, when one of Val's friends arrived in Middletown recently with his biplane the Merkel booster couldn't resist the temptation to snuggle down behind the wheel once more, and before anything more serious had happened, the accompanying photograph was snapped.

OUTING ON STATEN ISLAND.

ONE of the recent outings of the Bay Ridge M. C., of Brooklyn, N. Y., was to Kreischerville, Staten Island. About twenty members and their friends made the trip, which proved so successful that a number of other Sunday runs are being planned.

O. P. Warlick, M. M. Aiken and L. N. Vine, of Brooklyn, N. Y., on recent Sunday trip to Budd's Lake, N. J.

BACK FROM LONG TOUR.

MINNEAPOLIS, Minn.—Guy Webb, of the Arcade Cycle Exchange, of this city, returned recently from an Eastern trip of 2,123 miles which he covered on his Harley-Davidson. On returning to Minneapolis from Columbus, Ohio, where he stopped off to attend the annual F. A. M. meet, Webb met with some adventures. In a suburb of Chicago he was arrested and fined \$15 for speeding with another rider. He declares that excepting for some muddy roads near DeKalb, Ill., the highways were in fine condition. To avoid the hills near Dubuque, Webb took a straight course to Minneapolis by way of Sterling, Joliet and Cedar Rapids, Iowa.

GOING AROUND THE WORLD.

MINNEAPOLIS, Minn.—Harry Humphries, well known as a Marathon runner, left last week for a trip around the world on his two-speed Minneapolis motorcycle, accompanied by his wife on a tandem attachment. Humphries will travel to Vancouver and then to St. John, N. B., from where he will take the steamer for Southampton for a trip through the British Isles and from there on across the continent.

THE GOODYEAR BULLETIN.

THE special F. A. M. issue of the *Goodyear Tire Bulletin*, now being distributed, contains much matter of interest for the enthusiast who attended the convention as well as for the rider who could not find time for the trip to Columbus. A number of good photographs help to brighten the pages.

MOTORCYCLISTS throughout the metropolitan district are so well acquainted with Long Island roads that

little need be said as to the inducements they hold forth, but detailed information is not always at hand for the rider who plans a day's outing, and in such an emergency the following outline will meet all requirements. This route provides for only about 70 miles of actual riding, but there is an hour's journey by ferry included in it, so that in point of time the trip is as long as if 90 miles of road were covered. Incidentally the boat ride is one of the most pleasant features of the trip.

Where formerly Jackson avenue, leading out of Long Island City, was in such bad condition that it was omitted from most touring routes, now it is so fine throughout most of its length that it invites the motorist to set forth on it. The tour given here starts from New York City by way of the Queensboro Bridge. When the motorcyclist gets to the Queens end of that structure, instead of going ahead on Thompson avenue he is directed to swing left and take the fine asphalted surface of Jackson avenue.

Save for a bit in the neighborhood of the car barns, this road is delightful now, although the scenery along it is not exceptional. Once across Flushing Bay, however, there is something worth while. The route runs into Flushing, a beautiful old town. Just now, with trees in full leaf, arching over smooth streets, Flushing makes a pretty picture.

Broadway is the road that is taken now. Winding along the smooth surface invites speed that it is best not to attain. To those who enjoy touring only where the road conditions are best this is a section of the journey that will appeal. It is smooth going, along a fine type of country road all the way to Roslyn and down to Sea Cliff. The latter part of this journey lies along the shore of Hempstead Harbor and it is very pleasing to run along a finely oiled road, with the water on the one hand and the hills on the other.

Sea Cliff is about 25 miles out from the city and here the ferry may be taken over to Rye Beach, bringing the rider back into New York by way of Westchester County. The ferry runs from the Long Island side on the odd hours, so that if it isn't caught at 3 o'clock, for instance, the tourist will

have to wait until 5 o'clock for his next boat.

The sail across the Sound with a view back to fine estates in the neighborhood of Sea Cliff and ahead to the shores of Westchester, is an agreeable interlude in the motor trip. The boat takes about five minutes short of an hour for the journey.

Arrived on the other side the motorcyclist is at Rye Beach, where if there is no great hurry and the day is fine a swim or lunch may be in order. If no stay is to be made the tourist may take the clearly marked road back to the Boston Post road. Touring conditions here are not so good, but it is possible to find a couple of detours. Instead of swinging to the left when the Post road is reached the tourists should bear to the right and then turn left into Rye Beach avenue. Following this for perhaps half a mile a sharp left turn is to be made in front of a small house, into what is known as Keeler avenue.

This followed for a time becomes Harrison avenue and runs down into the Post road, avoiding most of the bad going between Rye and Mamaroneck. It is not possible to skip it all, so that the trolley tracks will be encountered for a part of the way in. Beyond where the trolleys turn off for Glen Island, at New Rochelle, a right turn up the hill leads over to the Mount Tom road, a private, smooth way that parallels the Post road and brings the tourists out after a left turn is made at the entrance to Travers Island. From here into New York the road is about all that could be desired.

It is possible also to strike off on Rye Beach avenue toward White Plains, if there is any desire to return to New York through that place. Road conditions up that way are better than they have been, so the rider may make this trip without fear of encountering going that is really bad.

The country covered by this tour is marked by a high average of good roads by views that are worth seeing.

RECRUITING FAIR RIDERS.

THE gentler sex in Coffeyville have taken to the two-wheeler like a duck to water. The dressmakers of that city have had more orders for divided skirts within the last three months than they have had in the 41 years in which Coffeyville has been on the map. This may sound queer, but it is a fact, and it is not an uncommon sight to see ten or fifteen motorcyclists on the streets every night with a lady tandem rider.

ON WANDAMERE BOWL

Brodbeck Enters Protest After Defeat by Bernstrom—Ward Matched with Whittler.

SALT LAKE CITY, July 24.—The Pioneer races at the Wandamere bowl were well attended and the meet was run off in good form. Al Ward and Fred Whittler were scheduled for a match race, but owing to a delay by the express company Ward's machine did not arrive from Columbus in time to allow him to compete. Ward was at the track.

The point race between Brodbeck, Bernstrom and McNeil was a battle from start to finish between Brodbeck and Bernstrom. The latter won all three heats and evidently Brodbeck was somewhat "peevish," for he at once protested Bernstrom's machine. Bernstrom did not care to have them know how he was getting his speed, so he disappeared and his machine was not measured.

Whittler tried to break Ray Seymour's four-mile track record made in competition. He rode against time and only equaled Seymour's mark, making the four miles in 2.51.

A TWO-DAY PROGRAM.

DES MOINES, Ia.—Exciting motorcycle races marked the two days' program held at Boone, Ia., July 30 and 31. Ralph Bates, the crack rider from Omaha, Neb., captured a majority of the events on an Excelsior. He was hard pushed by H. F. Younkens, of Cedar Rapids, on an Indian.

Two slight accidents marred the cards. On Tuesday "Bill" Austin, of Des Moines, riding a Harley-Davidson, had his machine skid and he was thrown under a standing auto. He sustained slight bruises. On Wednesday Younkens was more seriously injured while riding a match race with Ralph Bates. Younkens' machine skidded on a treacherous turn, and he was thrown. He sustained a broken leg and serious bruises. The race was called off.

FORT WAYNE RACE MEET.

IT is not often that a hundred-mile event is scheduled for a meet, but the Interstate Racing Association included one such in their August 4 program at Fort Wayne, Ind. The event was won by Tullis, Thor IV. Bomarck, Excelsior, hit the fence and retired, but made the round of the mile dirt track in 0:53. Four events only were run off. The summaries:

Five-mile pro., 30.50 limit—Won by Willis (Indian); second, Matthews (Thor); third, Bomarck (Excelsior). Time, 5:01½.

Ten-mile, 30.50 class—Won by Willis; second, Oberwegner; third, Tullis.

Ten-mile pro., 61 limit—Won by Matthews; second, Willis; third, Bomarck. Time, 10:35½.

One-hundred mile pro., open—Won by Tullis; second, Willis; third, Matthews. Bomarck out.

REWARD FOR TOPEKA COP.

POLICEMAN L. J. WONDERLY, of Topeka, Kan., is the recipient of the seventh reward of \$25 paid by the F. A. M. for the return of a machine stolen from a member. Wonderly recovered a motorcycle belonging to Dr. C. M. Hensley, of Topeka, which was taken on June 16 last. A man named Hogan was found guilty of the theft and sentenced to a year in jail.

PLANS have been completed for a race meet to be staged on the half-mile track at Mt. Vernon, Ind., on August 25,

F. A. M. GAINS BY STATES.

NATIONAL SECRETARY GIBSON has prepared the following table to show F. A. M. gains by States for the month of July:

Maine, affiliated, 0; unaffiliated, 1; renewals, 1; New Hampshire, affiliated, 0; unaffiliated, 0; renewals, 1; Massachusetts, affiliated, 15; unaffiliated, 12; renewals, 21; Rhode Island, affiliated, 2; unaffiliated, 4; renewals, 0; Connecticut, affiliated, 0; unaffiliated, 4; renewals, 2; New York, affiliated, 27; unaffiliated, 38; renewals, 41; New Jersey, affiliated, 10; unaffiliated, 5; renewals, 5; Pennsylvania, affiliated, 65; unaffiliated, 37; renewals, 51; Maryland, affiliated, 4; unaffiliated, 2; renewals, 8; Virginia, affiliated, 10; unaffiliated, 0; renewals, 118; unaffiliated, 97; renewals, 80; Indiana, 7; renewals, 2; District of Columbia, affiliated, 6; unaffiliated, 1; renewals, 1; South Carolina, affiliated, 2; unaffiliated, 2; renewals, 0; Tennessee, affiliated, 0; unaffiliated, 0; renewals, 1; Georgia, affiliated, 6; unaffiliated, 2; renewals, 1; Alabama, affiliated, 4; unaffiliated, 0; renewals, 0; Florida, affiliated, 7; unaffiliated, 3; renewals, 9; Texas, affiliated, 0; unaffiliated, 2; renewals, 2; Kentucky, affiliated, 4; unaffiliated, 0; renewals, 5; Oklahoma, affiliated, 2; unaffiliated, 1; renewals, 0; Ohio, affiliated, 118; unaffiliated, 87; renewals, 80; Indiana, affiliated, 62; unaffiliated, 26; renewals, 27; Illinois, affiliated, 34; unaffiliated, 35; renewals, 33; Missouri, affiliated, 0; unaffiliated, 0; renewals, 4; Wisconsin, affiliated, 14; unaffiliated, 13; renewals, 13; Michigan, affiliated, 22; unaffiliated, 12; renewals, 4; Minnesota, affiliated, 0; unaffiliated, 1; renewals, 4; South Dakota, affiliated, 1; unaffiliated, 0; renewals, 3; Nebraska, affiliated, 6; unaffiliated, 1; renewals, 1; Kansas, affiliated, 60; unaffiliated, 16; renewals, 10; Iowa, affiliated, 1; unaffiliated, 2; renewals, 8; California, affiliated, 39; unaffiliated, 4; renewals, 12; Utah, affiliated, 0; unaffiliated, 4; renewals, 4; Colorado, affiliated, 0; unaffiliated, 3; renewals, 5; New Mexico, affiliated, 0; unaffiliated, 1; renewals, 0; Arizona, affiliated, 0; unaffiliated, 0; renewals, 2; Montana, affiliated, 1; unaffiliated, 0; renewals, 0; Idaho, affiliated, 0; unaffiliated,

1; renewals, 0; Oregon, affiliated, 18; unaffiliated, 0; renewals, 5; Washington, affiliated, 17; unaffiliated, 0; renewals, 7; Philippine Islands, affiliated, 10; unaffiliated, 0; renewals, 0; Panama, affiliated, 1; unaffiliated, 0; renewals, 0; Canada, affiliated, 22; unaffiliated, 1; renewals, 0; England, affiliated, 0; unaffiliated, 0; renewals, 7. Totals, affiliated, 601; unaffiliated, 338; renewals, 393.

LIVELY CANADIAN SALES.

H. W. KIPP, the Canadian representative of the Hendee firm, is on an extensive tour of the Eastern provinces in Canada, where he has met instant success in securing orders for the Indian mount. On August 1 he had sold 300 machines on the trip, two carload lots being among the orders obtained. Bowman Brothers, Saskatoon, and R. Williams, Edmonton, both contracted for fifty machines for immediate delivery. Kipp is winding up his tour on the Pacific coast.

Cruickshank, the Winnipeg Indian agent, had sold, on August 1, no less than 124 machines this year to the local trade, whereas his total sales last year were only thirty. F. H. Lemon & Company, the Toronto Indian distributors, had disposed of 173 motorcycles by the same date to the city and Province trade, mostly the former.

SWELLING TWO FUNDS.

A DONATION fund for the widow of the late Bob Hunter, professional performer on the Cleveland Motordrome, has been sent out by the Cleveland M. C., and to date nearly \$300 has been collected. A check for \$5 from the Cleveland M. C. has also been sent to the Jake De Rosier fund.

A MUNICIPAL GARAGE.

COLUMBUS, Ohio.—The contract has been awarded for the erection of a municipal garage in which will be housed the motorcycles and automobiles attached to the police department of Columbus.

THE Leavenworth (Kan.) Motorcycle Club's first run this summer was to St. Joseph, Mo., a distance of 120 miles.

TO SEAL ALL CUT-OUTS.

COLUMBUS, Ohio, August 2.—Chief of Police Charles Carter is preparing a sweeping campaign for the sealing of all motorcycle and automobile mufflers on machines operated in this city. The chief has

Columbus Mayor Who Favors Radical Muffler Ordinance to Silence the Cut-out Fiends.

the measure already framed and will present it to the City Council when it convenes the latter part of this month. By this move Chief Carter hopes to get a "strangle-hold" on those motorists who are making life miserable for the city folk.

"My views on the subject of compelling the sealing of all mufflers on machines operated in the city are very decided," Chief Carter said in an interview. "For a long time the people of the city have been annoyed by those motorists who delight in speeding about the city streets and getting all the noise possible from their machines. This noise must stop, and I think my measure will be the means of putting an end to it."

A RESOURCEFUL M. D.

IN order to live at his summer home in one part of Minnesota and still visit his patients in another part of the State, Dr. J. J. Ratcliffe has adopted the motorcycle to carry him back and forth.

THESE RIDERS WERE FANS.

AFTER several score of motorcyclists arrived at Lawrence, Kan., recently on a recreation spin, two baseball teams were picked from among the riders and a fast game of ball was played.

AMATEURS IN GOOD FORM.

SAN DIEGO, Cal.—Great interests was shown in the motorcycle races on the Sweetwater flat dirt track at National City on July 22. Five thousand persons applauded the plucky riders, all amateurs of San Diego.

ONE of the features at the State Fair to be held at Syracuse, N. Y., will be a motorcycle race on September 14.

Robert Rucker, Emblem Agent in O'Keene, Okla., making a short cut through a field.

AMONG THE CLUBS

BIG MOTORCYCLE PROGRAM

Nearly Two Thousand Riders Attend Annual Outing of California Clubs at Livermore.

OAKLAND, Cal.—The members of the Oakland M. C. co-operated with the clubs at San Francisco, Sacramento, Stockton, Santa Rosa, Napa, Vallejo, San Jose, Santa Cruz and neighboring places in presenting the program for "Motorcycle Day," which was observed at Livermore on August 4. Nearly 2,000 motorcycles were at the scene of the celebration, about 500 more than participated in a similar program last year. There were games of all kinds, road races for both single and twin machines, baseball games, dancing and a fine dinner. Prizes were awarded the winners in the various events and the program throughout was handled on a large scale.

Incidentally the Oakland club made arrangements to have motion pictures taken of its members on the road and of the big gathering of riders during the games and races at Livermore. The program was looked upon as the most successful of its kind ever held in the State.

PLAN MONTREAL CLUB.

FINDING that bicycling is "still going back" in Montreal, Can., Louis Rubenstein, one of the boosters of the city, is working for the organization of a motorcycle club. It is the intention to affiliate with the Canadian Motorcyclists' Association.

A CALIFORNIA OUTING.

MEMBERS of the Long Beach (Cal.) M. C. enjoyed a run to Eagle Rock canyon on Sunday, July 21, a distance of 35 miles. A halt was made for dinner at the canyon, the refreshments being served at the expense of the local motorcycle dealers.

HENRY SEIB acted as secretary of the New Jersey Motorcycle Club, of Newark, N. J., during the absence of Secretary Elmer Crosbie, who attended the Columbus convention.

THE Plainfield (N. J.) M. C. made a run to Lambertville on Sunday, July 28. Seven riders started and five completed the trip.

MEMBERS of the Jacksonville (Fla.) M. C. recently enjoyed a smoker and entertainment program at the home of O. L. Vordermark, one of the club boosters.

FLOYD W. BAUM, captain of the motorcycle club at the University of Illinois, is on his way around the world.

HELD RUN IN RAIN.

CHICAGO, Ill.—The Englewood Motorcycle Club held its second run in the quarterly trials on Sunday, July 28, to Rensselaer, Ind., and return, a distance of 170 miles. There were 30 entries, but it rained the greater part of Saturday night and there were but 13 starters, who left in a down-pour. The rain continued most of the morning, leaving the roads in very bad condition. Only eight of the riders finished. Their scores were as follows:

R. McLaughlin, Harley-Davidson 7, 1,000; Peter Thom, Harley-Davidson 7, 1,000; Wm. Foster, Indian 7; 7,000; Harry Parker, Excelsior 7, 1,000; Gale Smart, Thor 4, 1,000; R. P. Miller, Excelsior 7, 1,000; Oscar Harris, Harley-Davidson 7, 978; Ed. La Violette, Harley-Davidson 4, 934.

Twelve-year-old rider of Richmond, Cal., and the novel machine on which he attended a recent meet of the Oakland M. C.

NOT AFRAID OF WATER.

FLOODED streams between Saginaw and Bay City, Mich., failed to impede the progress of thirty enthusiastic motorcyclists who recently made the journey between the two cities during "high water."

PLANNING BIG PROGRAM.

THE Chicago M. C. is now making arrangements to hold a club race meet and barbecue at the Riverview Motordrome, which will be one of the largest club events of the year.

NORFOLK CLUB ON RUN.

NINE members of the Twin City Motorcycle Club, of Norfolk, Va., recently made a Sunday run to Fentress, a hamlet about 14 miles out of Berkeley. Owing to the fact that the Deep Creek turnpike had been heavily oiled a few days before, plans for a run from Norfolk to Portsmouth, cutting across from Great Bridge to the Deep Creek road, were abandoned.

MOTORISTS ON THE JUMP

Cleveland Starts Traffic Improvement Campaign on a Sweeping Scale—Louie Mueller a Victim.

SEVERAL hundred owners of motorcycles and automobiles in Cleveland, Ohio, were arrested in one week recently for various infractions of the traffic ordinance. Heretofore the traffic regulations have received scant attention, but the police department has now gone to the other extreme and many motorists have been "jugged" for what appear to be trivial reasons. Speed traps have been set in dozens of places about the city and the fines are swelling the municipal coffers.

L. J. Mueller, Indian agent in Cleveland, was one of the victims. Louie, as he is popularly known, was smoking a cigar as he mounted his machine and prepared to get under way with his tri-car. As he kicked up his stand, started his motor and opened the throttle Mueller was approached by a policeman who shouted: "Hey, you're smoking!"

"I know it," replied the imperturbable Louie, "what about it? Can't a man smoke a cigar without having the police department butt in on him?"

"He can smoke a cigar," explained the officer, "but there's a law against smoking a motor, and you're under arrest."

At this juncture it dawned upon Mueller that the officer was referring to his exhaust, and he was obliged to go to police headquarters and convince the judge that a certain amount of smoke was justifiable in starting a motorcycle. He explained that he has been handling motorcycles for ten years and argued that he ought to know a "thing or two about them." The judge thought so too and Mueller was discharged.

Many others, however, were not as lucky as Louie. So many charges have been framed that it is difficult for either a motorcyclist or an automobilist to drive through the city without violating some provision. Arrests have been made for speeding, smoking of motors, passing a trolley while it is unloading passengers, cutting corners, stopping on the wrong side of the street, carrying girls on motorcycles after 6 p. m., using muffler cut-outs, standing machines near fire plugs, improper placing of license numbers and several other reasons. As the present campaign is considered unreasonable the Cleveland M. C. and the Cleveland Automobile Club are taking up the situation with a view to protecting their members.

OWING to heavy rains the Rockford (Ill.) M. C. postponed its endurance run scheduled for July 21.

VISITED
POPE PLANT.

WILLIAM WARD, JR., and Richard Ward, of Camden, N. J., who are touring New England on their Pope motorcycles, called at the offices of The Pope Manufacturing Company in Hartford recently. Later they rode up to Westfield, Mass., where they visited the Pope bicycle and motorcycle plant. They report a pleasant trip and fair roads.

OFFICERS OF THE COLUMBIA (GA.) CLUB.

Left to right—President Page, Vice-President Ingram, Secretary-Treasurer Wright and Former Secretary-Treasurer McCollum.

OVER-ZEALOUS
DEPUTY.

IN order to capture a motorcyclist who was supposed to be exceeding the speed limit at Pablo Beach, Fla., recently a deputy drove an automobile in front of the single-tracker, causing the rider to take a serious spill. Action is being taken to recover damages by the rider who was injured.

A DESPERATE
TOURIST.

EDWARD G. NOLL, a member of the Wilmington (Del.) M. C., reports that on a recent run from Dover during a storm he was obliged to ride for several hundred yards in a wheat field, the traveling being better there than on the road.

ON TOUR TO DENVER.

R. L. WEBBER and O. G. Jennings, of Mt. Sterling, Ill., have started on a motorcycle tour with Denver as their destination. They are going by way of Des Moines and Omaha where they will strike the transcontinental trail into the Mile High City.

MUST SHOW LICENSE PLATES.

UNDER a recently adopted ordinance motorcyclists in New Orleans, La., must have a license and show number plates on their machines. The new regulation went into effect August 1.

HASHA ON NEWARK BOWL.

MANAGER PAUL DERKUM, of the recently opened Newark (N. J.) motordrome, announces that Eddie Hasha will ride regularly on the Jersey bowl for the remainder of the season.

IN six months six motorcycles used by Detroit, Mich., policemen carried the officers 30,000 miles at an average upkeep expense of \$2.18 for each machine.

WILLIAM KAPPMAYER, of Aberdeen, North Dakota, is traveling in Illinois on a 2,500-mile motorcycle trip from Aberdeen to Alton, Ill., and return.

A 1,500-mile motorcycle trip in six days is the feat of Archie Olberg and Ed Schwalbe, of La Crosse, Wis., who recently rode their machines to Fremont, Neb., and return.

MOTORCYCLE WIRELESS KIT

Miniature Outfit Mounted on Luggage Carrier Has Sent Messages More Than Fifteen Miles.

G. F. CAMPION, an English motorcyclist, has been conducting highly interesting experiments of late with a wireless telegraph outfit mounted on a motor two-wheeler and designed for use while the machine is in motion. It is stated that the tests have been quite successful. The transmitting apparatus, which is attached to the carrier of the motorcycle, has to be of the simplest possible nature, also while the machine is being ridden the aerial must be limited in height. However, as this is adjustable, being, in fact, composed of a number of lengths of fishing rod, it can be lengthened when the machine is stationary, and consequently messages can be sent to a greater distance, the height, of the aerial being one of the determining factors of the space which it is possible to cover. It is obvious that when the rider is on the move a tall attachment is out of the question, because it might foul the branches of trees, telegraph wires or any overhead obstruction, and cause an accident.

A message was successfully sent from Loughborough to Nottingham while the machine was traveling at the rate of 35 miles per hour, a distance of about 15 miles. This is quite sufficient to prove the practical use of the instrument, though it is by no means its limit. It is understood that messages have been sent as much as 30 miles.

COULD NOT STAND THE PACE.

WHEN a mad dog created a panic by dashing through the business section of Detroit, Mich., recently, Motorcycle Officer William Bird took up the chase, cornered the enraged animal and was about to shoot it when it dropped dead from exhaustion.

A LONG-DISTANCE SALE.

THE first American motorcycle to be imported into the United States of Columbia was a Pope motorcycle recently shipped to Cartagena by The Pope Manufacturing Company. This motorcycle is to be used in Bogota.

ARMY MOTORCYCLES.

DURING the recent review of the Austrian motor volunteer corps before the emperor and Archduke Frederick, in addition to the large number of automobiles, there were sixty motorcycles.

VOTE-GETTING BY MOTORCYCLE.

WILLIAM QUACKENBUSH, city treasurer of Little Falls, N. Y., who seeks the nomination for county clerk, has purchased a New Era machine with which to flit from point to point on his stump speaking trips.

OKLAHOMA CITY SQUAD.

MOTORCYCLE enthusiasts of Oklahoma City, Okla., lined up in front of the Goodyear Tire & Rubber Company's

branch prior to a recent run into the country. All the machines are equipped with Goodyear tires. The motor two-wheeler has come into favor rapidly of late in Okla-

homa City and vicinity, and merchants are now considering its advantages for city delivery service, as well as for the use of their salesmen in suburban districts.

LARGER QUARTERS NEEDED

**National Secretary Gibson Has Option
On An Ideal Office Suite for
His Busy Staff.**

WITH a view to obtaining more commodious quarters in order that his work may be facilitated for the coming fiscal year, National Secretary G. B. Gibson has called attention to his needs in the following letter, copies of which have been forwarded to President Patterson, of the F. A. M., and the Board of Directors:

"Your secretary takes the liberty of sending to each of you this circular letter, being fully aware that it is primarily the duty and prerogative of your chairman to take such a course. We believe our note will allow us to be excused for thus acting. (1) In regard to our present office location.

"As mentioned in our annual report, we must move to larger, better-arranged quarters. One of your honorable board, E. M. Estabrook, was here in Westboro, August 2, and spent a whole day with us, and is therefore fully acquainted with our situation. At present we are cramped for room, and do our important work under disadvantages. We have the refusal of a suite of five rooms, well arranged for our work, giving me a private office, a large room for our stenographers and card cabinets of records and correspondence; this room to be in charge of Mrs. Gibson; two rooms for stock rooms which can be arranged with shelves for our very big supply of printed

matter; a back room for odd storage and for the receipt and opening of supplies. Then there is connected a toilet and bath room. This suite is on the third floor of a brick block opposite the postoffice and in the same building with the local express office. I can lease this for \$200 a year, with steam heat and electric light. I have the refusal of this for one month. I can have the privilege of renewal. I wish to state that every through train on the New York Central throws off and takes on mail, of which we have a well-arranged schedule. We frequently get mail in the postoffice to a member, etc., within ten minutes of the time we receive his letter. Our office boy goes to every mail and our response is quick.

"Also much of our matter goes by express; simply take it downstairs, one of the two envelopes going to every new member, and each renewal envelope must be hand-stamped; these the office boy takes to the mailing shelf and so requests. Then much of our mail requires personal talk with the mailing clerk. This rent for what we get is very reasonable. We secure here stenographers good for our work at a low figure. Our local printer does our printing very reasonably, and gives me preference over

all his other customers for quick service, on my promise and fulfillment of paying him promptly on the first day of each month for all work done in the preceding month, less 2 per cent. discount; \$50 saved thus in 1912. Mr. Estabrook is in favor of the change and wishes it so understood.

"Up to February 1, 1912, Mrs. Gibson and I, with one stenographer, did our work in one room, heated by a stove, but that cannot be again; we require at least two office work rooms. The new place is ideal; the full side of the block next a park, five windows in the large corner room, and the side rooms have two windows each; each room has a large closet. I do not think we can be any better placed for work.

"(2) I wish the sanction of your board to purchase a safe; my personal one has always guarded our vital book records, vouchers, money, bank books and much historical statistical data. This safe is fairly bulging with its crowded contents, and much that I wish was in a safe is unprotected. I can probably get a good-sized second-hand safe for less than \$75.

"(3) I wish that some more practical plan might be adopted for designating local commissioners. Both Mr. Estabrook and I get many letters from good material who wish an appointment, and we have to state that we can do nothing, as the State commissioners do this; and that is the last of it. If some one, perhaps myself, could appoint direct these willing workers and send them their certificate of appointment and literature and stationery, it would be a good plan. But the State commissioner might then object. However, we all know that you must work this plan out."

A CRAFTY ANGLER.

FRED E. RAY, Henderson agent in Salt Lake City, Utah, as he appeared on his way home from a fishing excursion at Utah Lake recently. Ray is a fishing enthusiast, but he never fails to combine the pleasures of motorcycling with a fishing trip when the weather will permit.

CHASED AUTOMOBILE THIEF.

FREMONT, Ohio.—Four members of the Fremont M. C., while riding to Clyde, Ohio, recently assisted in a chase to locate an automobile thief who made away with a car that was left standing on one of the principal streets of Clyde.

William Wood, State Commissioner for Maryland.

R. S. Morton, F. A. M. State Commissioner for New York, keeping abreast of his Federation work.

Mrs. Frank L. Valiant deeply interested in the F. A. M. number of "Motorcycle Illustrated."

Miss Helen White, of Indianapolis, who rode to Columbus on a Pope machine, managing her mount like a veteran.

THE F. A. M. TOURS IN RETROSPECT

A group of interesting Columbus photographs which were crowded out of the last issue of this publication.

Charles Wetherhead, of Elkhart, Ind., who weighs 256 pounds, and who was the heaviest of the F. A. M. tourists to enter Columbus.

Jack Brandt, of the Troxel Co., welcoming Haskell, of the Harley-Davidson sales force.

Arthur F. Ferris, Harley-Davidson agent at Utica, N. Y., and Mrs. Ferris, who covered the northeastern section of the tour.

USED A ROPE TIRE.

GEORGE HUTTON, a sign painter of Los Angeles, Cal., is traveling eastward on his motorcycle and at latest reports had covered 1,850 miles. In Oregon he rim-cut a tire so that it was worthless and being unable to obtain another he made one out of rope and rode the machine thus equipped a distance of 200 miles to Boise. He states that the rope worked well on level ground but gave trouble in hill climbing.

LONG TRIP ON TANDEM.

AFTER traveling 750 miles in seventeen days on a tandem motorcycle Mr. and Mrs. Samuel Switzer, of Rock Island, Ill., have returned home completely satisfied with the outing. They rode to Minneapolis and back, encountering many stretches of bad roads owing to heavy rains.

ONE OFFICER'S RECORD.

MOTORCYCLE OFFICER BUTTON, of Watertown, N. Y., has covered 3,000 miles on the city streets so far this season and brought in speeders whose fines footed up to \$210. The upkeep expense on the machine for this period was about \$30, \$13.50 being paid for a tire and \$6.50 for a new belt. The gasoline and oil outlay was less than \$10.

BY MOTORCYCLE TO WEDDING.

FRANK MARCEAN and Francis Gilbane, motorcyclists of Providence, R. I., recently made a trip on their machines to Schenectady to attend a wedding. They made a quick change from their riding togs to more formal costumes, participated in the program and then chugged back to Providence.

MOTORCYCLISTS EXCLUDED.

THROUGH the efforts of G. H. Tomkins, representing the Richmond (Va.) M. C., an ordinance recently framed providing that all drivers of motor vehicles must undergo an examination, obtain a license and wear a badge was so amended that the motorcyclists of the city are not affected. Mr. Tomkins asserted that any rider who intended to use a motorcycle regularly must be competent to insure his own safety and that no official examination is needed. This argument so impressed the City Fathers that the clause referring to motorcycles was stricken from the new measure.

ANNOUNCEMENT is made that the Standard Oil Company has raised the price of gasoline one cent a gallon, making the rate 16 cents.

ATTRACTIVE FEATURES IN POPE "BIG 4"

New Model Has Motor With Increased Power, Offset Cylinder, Valves in the Head and Distinctive Combination Of Clutch and Idler on One Lever.

HAVING demonstrated that there is a broad field for a light, moderate-powered motorcycle, combining attractive lines and dependability at a popular price, the Pope Manufacturing Company is now offering a new machine, Model K, which will be marketed in conjunction with Model H, the type with which the company has already won a large following. Model K will be known as the "Pope Big 4," owing to its provision for more power than is usually credited to a 4 h. motor, and it embodies a number of features of special interest. It has an offset cylinder, eliminating a dead center and insuring maximum power at low speeds; cylinder and head separately cast, to prevent carbon deposits and facilitate cleaning; valves in the head, interchangeable and mechanically operated; combination clutch and idler, operated by one lever and giving thorough control of the transmission; Pope spring fork, and frame with motor as keystone, giving a low center of gravity.

It will be seen from reference to these features that Model K is a worthy follower in the path blazed by Model H. While designed along the general lines of the first model the new machine is intended to provide greater power and speed and to meet all the demands of the Pope enthusiast whose need is for a machine of broader scope than Model H. The motor fitted to Model K has a piston displacement of 30.50 cubic inches, and is guaranteed to have a comfortable margin over 4 horsepower. In this connection the valves in the head are worthy of note. Providing as they do for direct entrance of the mixture they permit of maximum force in the line of best advantage, directly downward. Both intake and exhaust valves are mechanically operated and are located in the exact center of the explosion head.

Unusual length in the crankshaft and generous weight in the flywheels make for efficiency and long life in the motor. The flywheels are nine inches in diameter and total 25 pounds in weight. The bearings are of phosphor bronze of ample size.

A distinctive feature in the new model is the combination clutch and idler. One lever governs the operation of the belt and the control of the clutch, instead of two, as formerly. The single lever works from three positions, thus permitting of the best results at a slow pace, on hard pulling and at high speeds. The Eclipse free engine clutch is standard equipment. The frame of Model K possesses distinct characteristics of beauty and efficiency. A long, well-braced steering head effectively supports the front wheel, and a drop top bar affords a low saddle position. Reinforcement of connections, a girder-plate construction and a system of dip brazing give the frame unusual rigidity.

The machine is provided with a hand force pump and splash lubrication. Fresh oil is constantly drawn from the tank and delivered into the camcase where it thoroughly lubricates all the working parts, through ducts and passages. A window is

provided in the right side of the motor-base, acting as an oil gauge. The machine has double grip control, the right grip operating the compression release and spark, and the left grip controlling the throttle. The transmission is by 1 $\frac{3}{4}$ -inch flat, endless belt, which with the combination clutch and idler control affords a flexible and still thoroughly dependable transmission of power. The wheelbase is 56 inches and 28-inch wheels are fitted. An up-to-date addition has been made to Model K in the shape of a large metal tool box, placed between the seatmast and the rear guard. A large door gives easy access to the tools. A large tire pump fastened to the frame and a quart of oil also accompanying each machine.

The Schebler automatic carbureter, type H, is fitted, and the Herz magneto is standard equipment. The two-compartment tank carries two gallons of gasoline and two quarts of oil. A 10-inch muffler makes silence a feature in the operation of the machine. Large mudguards, 3 $\frac{3}{4}$ inches in width and 21 inches long, make for cleanliness and the comfort of the rider. The Persons "Champion" saddle is standard equipment and the front wheel has an Eclipse knock-out axle. The rear wheel carries an Eclipse coaster brake. United States tires, 28 by 2 $\frac{1}{2}$ inches, are supplied. The finish is London Smoke, with blue striping and all bright parts are nicked. The standard gear ratio is 4.6 to 1; optional, 4 to 1. Model K is listed at \$200.

HANDY BREED ATTACHMENT.

AN attractive tandem attachment, showing sturdiness and simplicity in construction, is now being marketed by the Breed Manufacturing Company, of Bay City, Mich. The attachment is designed to fit any machine, all its parts being adjustable, and folding steps practically eliminate the danger of breakage. As it is usually the footrests that suffer in a spill the Breed company has constructed them to fold up against the downrunners. This arrangement also adds to the appearance of the machine when the tandem is not in use. The attachment is handled only at wholesale. Full information and literature will be forwarded promptly on request.

NEW VICTOR FACTORY.

THE Victor Lamp Company of Cincinnati, Ohio, which manufactures motorcycle lamps and tool boxes for automobiles as well as automobile lamps, has been forced to open a new factory to meet the enormous demand for its products.

NEW GOODYEAR BRANCH

MINNEAPOLIS, Minn.—A. F. Osterloh, manager of the western division of the Goodyear Tire & Rubber Company, has been in this city of late to close negotiations for the construction of a three-story building at Hennepin avenue and Twelfth street. So rapid has been the growth of the Goodyear company's business here, both in motorcycle and automobile tire goods, that new quarters were found to be absolutely necessary.

BUSY AT HAGSTROM FACTORY.

BETWEEN shipping its improved spark plugs and other motor accessories and mailing its free Prest-O-Lite tank keys, the Hagstrom Bros. Manufacturing Company, of Lindsborg, Kan., has been so busy of late that it has been obliged to work with an increased staff. By way of getting acquainted motorcyclists are invited to write for one of the tank keys and also make any inquiries that suggest themselves. Both key and information will be forthcoming promptly.

FROM A BRITISH SPORTSMAN.

THAT the sporting spirit among English motorcyclists extends to something more than fair treatment of a rival in competition is evidenced by a letter received a few days ago from T. A. Carter, manager of The Purley Motorcycle Depot, 6 High street, Purley, Eng., enclosing a substantial money order to be added to the Jake DeRosier benefit fund. Mr. Carter collected over \$25 in shilling contributions on the Isle of Man during the Tourist Trophy races, and he is still at work raising money for the fund. Carter is a motorcyclist of

wide experience who met DeRosier during his visit to England last year. He took a fancy to Jake, and is now demonstrating his esteem in a most practical manner. The money order has been forwarded to DeRosier at the Crocker Street Hospital, in Los Angeles.

Carter, by the way, is anything but a mollycoddle when it comes to pushing the miles behind him. The accompanying photograph shows him astride his 8 h. Matchless racer with sidecar. He has turned off 63 miles an hour at Brooklands with this mount, which, as will be noted, has every mark of a record-crimper.

SENSATIONAL SPILL ON NEWARK BOWL

NEWARK, N. J., August 5.—In a sensational spill that occurred during the running of the elimination trials at the Motordrome on Sunday afternoon. Charles Davis, the Brooklyn motorcycle speedster, came within an ace of being fatally injured. The race, which was fifth on the card, was one of an elimination series that is being run at the track to settle the track championship. Davis's opponent was Freddie West, of San Francisco, the former bicycle rider, who has taken part in numerous six day races here.

At two miles West had picked up all but fifty yards on Davis. At five miles West reached Davis's rear wheel, but could not get up enough speed to go by. The men traveled in this position for three miles, neither gaining a foot.

At nine miles West was all in and quit, shutting off power and coasting around the track at the bottom. Davis meanwhile was sailing around the bowl at about eighty miles an hour. The second time around, after West shut off, he stopped, and was just dismounting in front of the riders' paddock when Davis, who had ridden himself practically blind, struck West with his shoulder. West was hurled to the ground. Davis was sent spinning up the track, and after describing two complete pinwheels finally rolled to the bottom, senseless. Davis's machine hurtled through the air and along the track for eighty yards before coming to a rest.

West had no injuries other than a bruised shoulder and competed in the other races of the day. Davis, who was unconscious, was later removed to the German Hospital. His injuries consisted of a broken finger, and a bad cut over his right eye. Later he complained of a pain in the chest.

Eddie Hasha was in his speediest form. He covered two miles in the final heat of the Class A race in 1 minute 17 seconds. His last mile was caught in 37½ seconds, the fastest time for a mile ever ridden on a five-lap track. He won all three heats of Class A and took the five-mile free-for-all.

Summaries:

New Jersey Club Race, 4 miles, amateurs—Won by William Brown; second, Carl Segelbach. Time, 3:18½.

First heat, Class B, professional, 2 miles—Won by F. A. King, Denver (Indian); second, Albert Carlson, Providence (Indian); third, C. E. Davis, Brooklyn (Indian). Time, 1:29.

Second heat, Class B, 3 miles—Won by F. A. King, second, Freddie West, Los Angeles (Indian); third, C. E. Davis. Time, 2:14.

Final heat, Class B, 5 miles—Won by F. A. King, second, Albert Carlson; third, E. S. Eckel, Washington, N. J. (Indian). Time, 3:47½.

Professional Motordrome Sweepstakes; elimination No. 2, 10 miles, 1 lap—Won by C. E. Davis; second, West. Time, 7:35½.

First heat, Class A, 2 miles, professional—Won by Eddie Hasha (Indian); second, Ray Peck (Excelsior); third, L. Flickenstein (Indian). Time, 1:24½.

Second heat, Class A, 2 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 1:26.

Final heat, Class A, 2 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 1:17.

Two miles, amateur—Won by Constant, of Brooklyn (Indian); second, Eckel. Time, 1:23½.

Free-for-all, 5 miles, professional—Won by Hasha; second, Peck; third, F. A. King. Time, 3:22½. Charles Fuller Gates, referee.

NEWARK, N. J., August 3.—Chas.

Fuller Gates, having arrived in town from the West, Manager Paul Derkum, of the motordrome, promptly made him referee for tonight's meet to the consternation of the riders, especially the Western men. The "Satrap" proved to be an ideal official, however, to the relief of the Eastern boys, who imagined that he would fine them if they even attempted to clean their machines. Gates acted very fatherly with all the riders, and his work was appreciated. Hasha, as usual, cleaned up in true Texas style. The main feature of the day was an Australian pursuit race series which was started today, and will continue for several meets. F. A. King, of Denver, and C. E. Davis, of Brooklyn, started. The race was won by Davis. The boys rode eight miles and three laps before Davis overtook King. The winner rides Freddie West, of San Francisco, tomorrow and the winner of that heat will race Johnny King, of Newark, next Saturday. The event proved very exciting. J. U. Constant, of Brooklyn, the amateur champion, broke his record of 46 seconds for the track by doing the mile in 45½. The most exciting race was the third heat for the Class A men, in which Eddie Hasha spun around the saucer at a 39-second clip, doing the two miles in 1:18. Summaries:

New Jersey Club Race, amateurs, novelty event—Won by Carl Segelbach (Indian); second, Billy James (Indian); third, Seth Eberhardt (Indian). Time, 1:29½.

Class B, 2 miles, professional—Won by Freddie West (Indian); second, C. E. Davis (Indian); third, Albert Carlson (Indian). Time, 1:29½.

Second heat, 3 miles—Won by West; second, Davis; third, F. A. King. Time, 2:14½.

Final heat, 5 miles—Won by F. A. King; second, Davis; third, Carlson. Time, 3:48½.

Professional Motordrome Sweepstakes, Elimination No. 1—Won by C. E. Davis; second, F. A. King. Distance, 8 miles, 3 laps.

One mile exhibition by J. W. Constant. Time, :45½.

First heat, Class A, 2 miles, professional—Won by Eddie Hasha (Indian); second, Ray Peck (Excelsior); third, L. Flickenstein (Indian). Time, 1:23½.

Second heat, 2 miles—Won by Eddie Hasha; second, Ray Peck; third, Flickenstein. Time, 1:24½.

Third heat, 2 miles—Won by Hasha; second, Ray Peck; third, L. Flickenstein. Time, 1:18.

Free-for-all, 8 miles, professional—Won by Hasha; second, Ray Peck; third, L. Flickenstein. Time, 5:33½.

WINNER OF ROAD RACE.

ALFRED BITTNER, of Anaheim, Cal., who appears in the accompanying photograph, was the winner of the 20-mile road race held at Anaheim on July 4. The twin Indian shown in the picture is the one on which he led the field home. Photograph forwarded by William H. Houts.

Exterior and interior views of the store of the Gotham Motor Company, New York Agents for the Yale, 92-98 St. Nicholas Avenue.

STOLEN MOTORCYCLES.

FIVE Harley-Davidson machines, as listed below, have been reported stolen: Single-cylinder, 1912, battery model with free wheel control; engine number 363 B. A.; State license number 1031; Ever-Ready speedometer, Prest-O-Lite tank, head and tail lights, Goodyear studded tires; reward, \$25. Notify George Krueger, 2016 Thirteenth street, Chicago, Ill.

Magneto, 1912 model, with free wheel control; motor number 1288 B; machine almost new; stolen from Dallas, Texas, on July 9. Reward, \$20. Notify George Huter, Dallas, Texas.

Chain-drive twin, from a St. Louis garage, July 19. Engine number 4708 B. Owner says: "Anything you can do in locating this machine will be rewarded and greatly appreciated." Notify E. V. D. Wallace, 5021 Minerva avenue, St. Louis, Mo.

1911 single, 26-inch wheels; stolen recently in Kenosha, Wis. Motor number 9774. Equipped with Majestic tandem, Purdy whistle, generator, head and tail lamps. Notify Robert Bentz; reward, \$25.

Magneto single, shipped from factory to Chicago. Except for 25 miles on road when tested machine had never been ridden. Equipped with free wheel control, Goodyear studded tires and Troxel saddle. Notify C. H. Lang, 1704 Michigan avenue, Chicago, Ill.

NEW METROPOLITAN CLUB.

GOFF & BURKE, proprietors of a motorcycle establishment at 521 West One Hundred and Sixty-fifth street, New York City, are the founders of a new club known as the Washington Heights M. C. For the present the headquarters of the club will be at the Goff & Burke store. Touring riders are invited to drop in and members of the F. A. M. on tour are accorded the privilege of storing their machines overnight without charge.

R. G. MOON, Carbondale, Pa., is the sixteen thousandth member of the F. A. M.

LITTLE JOE'S NEW DEAL.

BALTIMORE, Md.—Little Joe Weisenfeld, local agent for Thor and Yale machines, has just completed a deal whereby he secures two pieces of property adjoining his motorcycle headquarters at Howard and Baltimore streets. As a result he will be able to enlarge his sales and stock rooms to such an extent that he will have the largest establishment of its kind in the city.

AN UP-TO-DATE CORONER.

DR. S. G. McDONALD, coroner of Montgomery County, Kan., living at Coffeyville, has purchased a motorcycle to use in his work, thus discarding the horse and shay. The doctor is using a new Era machine which has just recently been delivered to him and is now one of the best boosters the motorcyclists of Coffeyville have.

THE Auto Cycle Company, of 514 St. Peter street, St. Paul, Minn., announces that it has taken the agency for the Henderson in the Twin Cities. The company has recently acquired the agency for the Flanders.

H. G. Baxter, Henderson Agent in Providence, R. I., on his new Demonstrator.

CLEVELAND NOTES.

CLEVELAND motorcyclists are now carrying their 1913 license numbers. They are white on black plates and must be carried perpendicularly; there is a provision against having them placed in a curve on the mudguard.

L. J. Mueller reports that he is receiving Indians by express, being unable to get them in large shipments. He has disposed of nearly nine carloads so far this year.

The Lister Motorcycle Company has sold nearly 125 Flying Merkel machines and about 500 Harley-Davidsons for the season. Despite this activity the firm is still behind in filling orders.

The West Side Motorcycle Company has placed over 50 Harley-Davidsons on the west side, and there are indications that this number will be considerably increased during the coming month.

Kumler Bros., agents for Flanders and Reading Standard machines in Cleveland, have taken on the Yale agency also. They have several of the chain-drive Yale twins on exhibition.

The K-V Motorcycle Company has sold eight Henderson machines, although they made a late start. This firm will also handle the Wagner in Cleveland and vicinity.

NEW TRIUMPH AGENCY.

HARRY SVENAGAARD, of Detroit, Mich., has taken the Triumph agency for the Straits City and vicinity. As a result he has extended his establishment at 473 Woodward avenue so that he will have a floor space 70 by 70 feet.

MOTORCYCLE SUPPLY COMPANY, Pawtucket, R. I.; capital \$10,000; directors: Berndt A. Svenson and Edward A. Leetz, both of Providence, R. I., and Clifford G. Frazier, Pawtucket, R. I.

SAM B. FOWLER and Palmer W. Shade left Dayton, Ohio, recently for a motorcycle tour into Canada.

AN UP-TO-DATE GARAGE

New Establishment, Under Management of Gene Coughlin, Has Storage Space for at Least Fifty Machines.

ONE of the largest and best-equipped motorcycle garages in New York City, has recently been opened at 533 West 110th street, under the name of the Riverside Motorcycle Garage. The garage proper measures 25 by 100 feet and has a floor capacity of over 50 machines. The main floor has the front occupied on one side by the counter and showcases, with full frontage for window space, and the latter is attractively dressed at all times. The remaining portion of the floor is divided into a large storage space for machines and a small but convenient shop. The latter has a well-fitted work-bench with vise, etc., and a grinder and drill press are located conveniently to the bench, so that work can be done with minimum confusion. The tools are kept in a large closet, with a place for each, so that any tool can be readily reached without disturbing any other. The main floor is electrically lighted, and the overhead shafting for the machine tools is driven by an electric motor.

A yard is located at one side of the garage, and work is done here when the weather is fine. This yard is floored and is 100 feet long by 15 feet wide. The shop is screened off from the storage room. On the upper floor, there is a large clubroom, fitted with comfortable, upholstered chairs and sofas, while the locker space is sufficient for over 60 patrons. It is the intention of the management to organize a club in a short time.

The second floor is fitted with apartments for the manager and has a bathroom in addition. The clubroom can be reached by a private entrance from the street or through the garage as desired. Additional locker space is to be found in a building at the rear of the garage, which is fitted as a private house. The location is an ideal one, being on one of the uptown thoroughfares, which is asphalted, as are all communicating streets and avenues. A full line of accessories is carried.

The garage is under the management of Eugene Coughlin, well known in Greater New York as a first-class repairman.

The Excelsior and Indian Agency of Austin Burges in Houston, Texas.

COX MAKES A CHANGE.

ANNOUNCEMENT is made by The Pope Manufacturing Company that L. D. Harden has been appointed manager of its bicycle and motorcycle sales department to succeed J. F. Cox, resigned. Mr. Harden has been with the Pope company for over twenty-two years. For several years past he has been assistant manager of the department which he now heads. During his long service in various capacities, Mr. Harden has become thoroughly acquainted with the company's bicycle and motorcycle business and identified with the trade in all its aspects.

After being with the Pope company twenty-seven years, Mr. Cox has become president and general manager of the E. T. Burrowes Rustless Screen Company, of Portland, Me. His resignation went into effect August 1.

Frederick W. Starr, also well known to the trade, has been appointed to succeed Mr. Harden as assistant manager of the bicycle and motorcycle department. Having been assistant manager of the Pope bicycle plant at Westfield, Mass., for a number of years, Mr. Starr brings to his new position a thorough knowledge of bicycle and motorcycle manufacturing.

KLARK ACCEPTS POSITION.

COLUMBUS, Ohio.—Don Klark, the Indian rider, has taken a position as general utility man with the Barr Motorcycle Company, of Columbus, central Ohio distributor for the Indian. Klark has not given up racing, but will devote his time while not on the track to the Barr company.

THIS WAS "SOME BELT."

THOMAS CHANDLER, of 613 So. Boman street, Danville, Ill., is an economist who deserves to go on record. Recently he forwarded the following letter to the Chicago Belting Company: "I have used one of your Sea Lion belts for 6,000 miles and sold it for \$5."

MINNEAPOLIS, MINN.—Thull & Julian, of 413 Fifth avenue south, are now handling the Thiem in this city. They have also opened a shop for motorcycle accessories and supplies.

Above—Part of the California Motorcycle Company's store at 16th and Hill streets, Los Angeles.

Below—Los Angeles riders of the Eagle.

NEW MINNEAPOLIS PLANT.

MINNEAPOLIS, Minn.—A definite announcement regarding the enlargement of the Minneapolis motorcycle factory to nearly five times its present output, was made this week following the return from the East of H. F. Turner, sales manager of the firm. Mr. Turner states that through the large increase of the motorcycle business in the Northwest, not only in the cities but in the country as well, the firm has decided to enlarge its factory and has several sites in view on the outskirts of Minneapolis where a factory can be built with better shipping facilities than the company now has. The building will be 250 feet by 300 and will be of fireproof structure. It will be two stories in height and the plans will be drawn with a view of further additions in the next five years.

COLUMBUS, Ohio.—John M. Schuster, a retired bicycle and motorcycle dealer of Columbus, died at his home 2226 North High street, after an illness of a year. He was formerly in the motorcycle business under the name of Schuster & Seibold.

WILL A. HARRIS, of Point Rains County, Tex., is known as the "motorcycle candidate" for Congress throughout his district. Harris has been making a strenuous campaign on his motor two-wheeler.

THE Supervisor of the Toronto Play Grounds Association rides a Pope motorcycle in traveling about the city. He weighs 225 pounds.

TWENTY-FIVE motorcycles figured in races incident to a regatta held at Stone Harbor, N. J., recently.

QUESTIONS and ANSWERS

MANY replies to the second question of the series begun in the issue of June 27 have been received and the winners will be announced in the next issue. The editor of the Questions and Answers Department wishes again to state that answers should be written so that the novice, and not only the more experienced rider, will understand the functions and construction of the device in question and that unnecessarily long letters should be avoided. A majority of the answers departed from the subject and thus were not eligible for the prizes. Care should be taken to give clear and complete answers. The answers to Question No. 3, given below, will be judged and the results published in the September 5 issue. For the benefit of readers in general the conditions of this contest are given again.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the second issue following the number in which each question is asked. For example, answers to question Number 2, republished in the present issue, will be printed in the issue of August 22. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of MOTORCYCLE ILLUSTRATED are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, MOTORCYCLE ILLUSTRATED, 51 Chambers street, New York."

Question No. 2. Describe the construction and functions of a spark plug.
Question No. 3. Describe, so that a novice will understand, the operation of a high-tension magneto. Answers published in September 5 issue.

FRANK

MERRITT

ALUMINUM PISTONS.

BYRON C. RACE.—The aluminum pistons are made from special alloys of aluminum and are not of aluminum alone. They are cast in dies as a rule, but occasionally made in the sand, or in metal molds. The idea is to get a very light piston, and if properly constructed they will keep their shape until worn out or broken in service. Such pistons crack before bending, and are fitted with one or two rings only. A set of alloy pistons may last one race, or as much as thirty events, but their life is uncertain. They are unsuitable for touring, and we strongly recommend the retaining of the regular cast iron pistons that came with the motor. Their cost is very great; for die-cast pistons, it is necessary to have dies cut, which is a considerable item, as you probably know. Then the machining is a delicate job, and the two pistons must be equal in weight, lightened connecting rods must be used, etc.

OILING AND OTHER TROUBLES.

J. L. MOORE.—See that the oil leads are clear. This may account for the front cylinder not getting enough oil. The check valve occasionally sticks and the pipe thus gets clogged. It would not be a very expensive operation to transform the machine to a chain drive. There would be machine work to be done on the front or motor-shaft where the pulley goes now, and the rear sprocket would have to be very large to get a single reduction. In

fact, it is doubtful if you could get a sprocket sufficiently large for the purpose. If so, more machine work and fitting to accommodate the sprocket in place of the pulley is necessary. If a double-transmission, chain-to-countershaft and chain to rear wheel were used, there would be further expense in fitting the countershaft to the frame of the machine and the manufacture of the countershaft. This is of course figuring on other than the factory doing the work. We suggest that you communicate direct with the factory before starting to make any such change; they may be able to have the work done for you in their shops. The tread of a side-car is usually between 36 and 39 inches. The best practice has the side-car and motorcycle rear wheels on line.

WORLD'S RECORDS.

JOHN HILL.—There are no "world's records" on motorcycles. The F. A. M. acknowledges officially certain "best performances" in both the professional and amateur classes, but no international records, hence, the term "world's record" is a mis-statement as regards motorcycles.

The Federation does not distinguish between a dirt and a board track in considering records for speed, distance, etc., hence there can be no official dirt-track records. Each local track has its (unofficial) record for various powered machines, and the promoters often fondly call the best times made "world's records" for that track, etc.

The fastest professional mile officially recognized was made by Ray Seymour, on May 17, 1912, at Los Angeles, the time being 0:36 $\frac{3}{4}$. The amateur mile record is held by Lon Clafin, and was made at Los Angeles on the same date; the time is 0:38 $\frac{1}{4}$. This with a flying start. The standing start one-mile record is held by Charles Spencer, 0:55 $\frac{1}{4}$ and was made at Springfield, Mass., on October 23, 1909.

LACK OF ECONOMY.

LOUIS H. ROESSGEN.—You should be able to get at least 65 miles or even better per gallon of gasoline with your motor, if it is in good condition. The overheating shows that you use too much, so cut down on the needle-valve, noting the color of the exhaust. On the lowest speeds this should be a deep blue verging on violet, and as the speed rises, the color should weaken, never losing the blue tint. If the color is yellowish tint shows that the mixture is too lean; give more jet opening. A red tint shows too rich a mixture cut down on the jet opening. See the MOTORCYCLE MANUAL, page 23, paragraph 56.

EUROPEAN ROUTES AND HOTELS.

WE have now on file several up-to-date European road maps. Readers who contemplate motorcycle tours on the Continent are invited to request from us such information as we have on hand covering European routes and hotels.

(More Answers to Questions on page 54.)

“I Have Ridden my 1910 Harley-Davidson 20,609 Miles and it is in A1 Condition Today.”

**J. N. HOWE, Supt.,
Electrical Department,
Northern Indiana Gas & Electric Co.**

No motorcycle in which quality and service are only secondary considerations could render service like that.

Thousands of Harley-Davidson riders have received the same satisfaction as Mr. Howe and many could write testimonials even stronger than his.

Good material and careful work cost more than cheap material and indifferent work, but neglect either one of these and the owner is the one who will really pay for it.

Correct design coupled with the right material and careful workmanship have made the Harley-Davidson's reputation.

“COSTS MORE, BUT WORTH IT.”

Harley-Davidson Motor Company

260 C Street

Milwaukee, Wisconsin

(Answers—Continued from page 52.)

CARBURETER TYPES.

W. A. RHOADS.—Carbureters for motorcycle use can be classed into three types. These are: Hand-controlled, semi-automatic, and automatic. In the hand-controlled type the primary air may or may not be regulated by a shutter, but the secondary or auxiliary air is regulated by hand, by moving a valve. The jet opening in this type is fixed. On starting with a hand-controlled carbureter, the primary air shutter is adjusted by running on the stand, and the auxiliary air valve closed to get a rich mixture. When running, the auxiliary air is regulated according to the requirements of the road, etc. The Brown & Barlow carbureter is of this type, as are the great majority of European carbureters.

The semi-automatic type has the jet opening controlled by hand or by the movement of the throttle, with the auxiliary air opening regulated by a spring-loaded valve operated by the suction of the motor. Some of these carbureters have a further adjustment on the needle-valve for low and high speeds. In operation, the jet opening is adjusted and the tension of the auxiliary air valve spring adjusted. Once set the adjustment needs changing only when the weather conditions or load conditions change. The Schebler, Breeze, etc., are of this type.

In the fully-automatic type, the primary and auxiliary air are taken through the same opening past the jet, the flow past the jet being governed by specially cut ports in the throttle barrel. Atmospheric changes are met by changing the jet itself, but this operation is rarely necessary. This type is the most scientific carbureter of the types mentioned and gives great economy. An example is the Claudel. There are of course a number of types combining the automatic features in semi-automatic carbureters, etc.

A BIG CONTRACT.**New Harley-Davidson Building.**

AN interesting view of the new addition to the Harley-Davidson factory in Milwaukee, in the construction of which 14,000 tons of concrete and 250 tons of steel are being used. The extension will add 90,000 square feet to the floor space of the plant.

NEW YORK TO BROCKTON, MASS.

C. M. FARRELL.—Take route 39 (Touring Number) to Hartford, Conn. Take route 13, Hartford to Worcester, Mass.; then route 10 reversed, Worcester to Boston. From Boston go to Milton, then on to Great Pond, Randolph, Avon and Brockton. The distance is 21 miles and the roads good. A trolley line can be paralleled most, if not all, of the way from Boston.

ON OVER-OILING.

J. O'LEARY.—You have too much oil in the crankcase, if the oil comes out at the push-rod, or the breather may be clogged up. Reduce the amount fed in and first drain the crankcase. Was there no instruction book with the machine? It may be necessary to flush out the motor with kerosene or dismount it and clean it thoroughly to free it from carbon. It is obviously in poor condition from over-oiling.

For the correct mixture proceed as follows: Get into a place where the open exhaust will not disturb anyone, then remove muffler and exhaust pipe. Start the motor and reduce the throttle opening by means of the grip to as small as possible (i. e. throttle her down.) Turn the needle valve on the carbureter until the exhaust flame is violet-blue. Run the motor on the stand and gradually give more throttle, being sure to have the spark advanced as far as possible at all times without the motor knocking. The exhaust gases should be lighter in color as the speed of the motor rises, but should never lose the blue tint. This violet-blue tint at low speeds is the sure sign of a perfect mixture. Try the same adjustment (with the muffler and pipe in place) on the road; it will generally be good for this also. Adjusting the mixture by sound is rarely satisfactory. There are but few experts that can get a perfect mixture that way, and the average repairman is far from being an expert.

See that the carbureter and valve gearing are in good condition and that the various oil channels are free. Did the agent guarantee that the machine was a new one? If the above does not help you, have the motor overhauled at a first-class repair shop; there are a number of good ones in New York.

TRENTON TO TRUMANSBURG, N. Y.

ARTHUR W. HYDES.—Referring to our Touring Number, take route 65 to Easton, Pa., at Trenton (33.0 miles). Go on to Easton, join route 60 to Delaware Water Gap. From Water Gap go to Stroudsburg, then to Bartonsville, Tannersville, Henryville, Paradise, Cresco, Pocono, Tobyhanna, Gouldsboro, Moscow, Elmhurst, and Scranton. The distance is 52.7 miles and the roads are fair, with waterbars and rough stretches between Tobyhanna and Moscow.

From Scranton take route 68 to Watkins Glen. From Watkins Glen go to Trumansburg through Burdett, Bennettsburg, Reynoldsville, and Perry City. Trumansburg is reached from an irregular 4-corners 19.4 miles out of Watkins Glen and 5.1 miles from Perry City. Follow macadam to left into Trumansburg. Roads, Watkins Glen to Perry City, fair to good dirt, fine views.

TO GREENWOOD LAKE, N. J.

A. W. HOLME.—From Ridgewood go over to Paterson. From Paterson go to Pompton, then to Wanaque, Boardville, Hewitts, Browns and Greenwood Lake, N. Y. The distance is 29 miles, the roads are good macadam to Pompton, then rather rough and narrow along shores of lake. This is part of route 36 in our Touring Number, from Pompton onward. Return by the same route.

NEW YORK TO LIVINGSTON MANOR.

G. GEORGE SATTLER.—From our May 16 Touring Number take route 36, New York to Greenwood Lake. From Greenwood Lake go on to 56.0 Bellvale, 59.5 Warwick, 65.1 Florida, 70.7 Goshen. From Goshen as 0.0 miles go on to 3.6 Denton, 8.4 Middletown, then 16.0 Bloomingburg. Here turn off left and go on to 20.6 Wurtsboro. Go on from the latter place to Rock Hill (27.6), then bad curve at 28.9, Neversink river covered bridge (29.0), and 33.0 Monticello. Bushville is 38.7 miles out of Goshen. Liberty is 45.2 miles, Parksville is 49.3 and Livingston Manor 54.9 miles. Roads, fair to good dirt, Greenwood Lake to Goshen; good roads with some dangerous crossings, etc. to Livingston Manor. Total distance 125.6 miles from W. 130th st., N. Y.

VERSATILE AIR-MAN.

PAUL PECK, of Washington, D. C., is one of several aviators who hanker for a motorcycle when they are not following a sky route. Peck rides a Flying Merkel machine and also owns an automobile. The latter, however, has been crowded out of the running of late, as Peck devotes most of his time to the motorcycle when on the ground. Photo shows him on his Merkel.

THE railroad has now discovered a unique possibility for the two-wheeler. One company has found that a motorcycle can be attached to the hand-car to furnish power for the latter.

GOODYEAR EXTENSIONS.

EXCAVATIONS are being made for another big building at The Goodyear. This addition to the present great factory group will be 400 feet long and 80 feet wide. It will be six stories high with basement, and will be made as nearly fireproof as possible. The Goodyear company is also adding two stories to two of the present buildings. Each of these buildings is 450 feet long and 60 feet wide. The new buildings

**The Present Goodyear Plant.**

and the two new stories will give the plant additional floor space of 266,000 feet, making in all a total floor space of 1,266,000 square feet.

The hills show how well your lubricant suits your motor.

With the wrong oil your motor must overcome both the hill and the faulty lubrication.

You will find that the correct oil carries you much more easily over the hills at high speed. On heavy roads the correct oil will yield more power, and give freedom from overheated motors.

Even the best of motors sometimes give trouble on a hard hill or a sandy road. Under these conditions the help given by correct lubrication is noticeable.

Different types of motor demand different grades of oil. By a thorough analysis of various motorcycles, we have prepared a complete lubricating schedule (printed on the right). It gives the grade of oil that will yield the greatest power from your motor.

In power-engineering circles these recommendations from us would be accepted as authoritative. You may feel assured that, in quality, the oils specified on the chart set a world standard.

They are put up in barrels, half-barrels, and in 5 and 1-gallon sealed, white cans.

The oils for motorcycles (refined and filtered to remove free carbon) are named:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "Arcctic"

All are branded with the Gargoyle which is our mark of manufacture.

TO THE TRADE

By carrying Gargoyle Mobiloils, with our chart of recommendations, you can say to the driver of any car or motorcycle: "I can give you the correct grade of oil for your motor. It is recommended by the Vacuum Oil Company—the recognized leaders in lubrication."

By handling Gargoyle Mobiloils you

also get the benefit of the strongest advertising campaign ever run for automobile lubricants. In addition to all the leading automobile and motorcycle magazines, we are running our large space advertisements in the Saturday Evening Post, Collier's, Literary Digest, Life and Scientific American. Later we will advertise in leading monthly magazines.

This list shows the right oil for your motorcycle.

Explanation: In this schedule the letter opposite the name of motorcycle indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." Recommendations cover all types of the same make unless otherwise stated.

Read What Capt. Stiles of the Chicago Police Says About— **JONES SPEEDOMETER**

WEST CHICAGO PARK COMMISSIONERS

DEPARTMENT OF POLICE

A. J. STILES, Captain.

Chicago, June 21, 1912.

Jones Speedometer, Chicago, Ill.

Gentlemen: It is with great satisfaction that I have at last found a Speedometer that has proven under all kinds of tests to be almost absolutely perfect. I have tried all other Speedometers and was compelled to discard them, as they would not stand a test for accuracy; or, in other words, were merely a guess. In using the Jones Speedometers in my department, I can conscientiously say that we have found on no condition and under no circumstances the Jones Speedometer to be wrong.

Inasmuch as we are making a great many arrests for the violation of the State Vehicle Law, and with a disposition to be fair, I say again that it was a great consolation that we have found a Speedometer that we can depend upon. These Speedometers I test every day under a stop watch, and with a very few exceptions they are always accurate.

Yours very truly,
ARTHUR J. STILES,
Captain West Park Police Department.

Police officers don't guess—guesswork isn't valuable testimony. They take no chances with inaccurate speedometers. They use the instrument that's "geared to the truth," that's just as accurate on the hottest as on the coldest day. The instrument that is impervious to electrical influence. Mr. Motorist, the Police Departments in all the large cities use the JONES SPEEDOMETER. Better get in line.

CAPT STILES AND TEN OF HIS MEN.

THE JONES SPEEDOMETER.

Tandem Attachments

Model 2.

MODEL 25

This equipment may be put on in a few minutes and make an ideal passenger carrier. The weight of the extra rider is placed well forward, making it very easy for the driver to control the machine under all conditions. For the motorcyclist who desires an all-around outfit, here is the best and only one of its kind on the market. Built by motorcycle men who know. Model 25, complete, as shown, \$12.00. Model 25, less carrier, \$5.00.

Model 25.

MODEL 2

Combined Luggage Carrier and Tandem Seat

Exceptionally strong and well made. Top or platform hardwood, with binding of $\frac{3}{4}$ -inch channel steel. The smooth flat top can be used with or without cushion. No rivets. Rear stay is one continuous arch of $1\frac{1}{4}$ x $\frac{1}{4}$ -inch spring steel. Top secured by malleable iron brace fitting over top of arch. Guaranteed to carry any weight axle will hold. Price, complete, highly-nickel-plated, \$7.00.

MODEL 47

The biggest value for the money ever offered. The luggage carrier is our Model 2, with the rear arch extended and formed into foot-rest. Cushion is our Style B, spring top, an extremely comfortable seat. Very light. Combination attachment, complete, with skirt-guard and spring top cushion, \$8.75.

Model 1.

It is readily and easily attached by the same screws or rivets that attach the clip spring to the mud guards, requiring no extra screws or bolts. No. 116, price, complete, postpaid, 50c.
Note—Clip not included.

Worthy Of the Name

Model 47.

MODEL 1

Readily attached to any motorcycle. Made of $1\frac{1}{4}$ x $\frac{1}{4}$ -inch spring steel. Non-breakable and non-twistable handlebar. Low, comfortable saddle position. Foot rests on spring pedals, well forward, whose wonderfully smooth action absorb all jars and assures the permanent foothold of the pedals. Model 1, price, complete, as shown, fully nickel-plated, \$15.00; without saddle, \$12.00.

Ero Stand Latch

The Ero stand lock not only does away with all soiled hands from locking and unlocking stand, but is a positive lock, preventing the stand from falling out on the road. Just press the trigger with the foot, when the stand will instantly drop out.

If the stand is lifted into position with a spring, it is then only necessary to press the foot, first upon the trigger to release the lock, and then follow the pressure down till the stand strikes the ground.

EVERY PIERCE RIDER MAKES THIS KIND OF A RECORD

Michigan City, Ind., July 29, 1912.

The Pierce Cycle Co., Buffalo, N. Y.
Gentlemen:

I have just completed a 250-mile trip to Fort Wayne and return with my model 12C Pierce single with side car attached, and the way the machine pulled the outfit through the sand and clay roads and steep hills which we encountered is little short of miraculous. Besides the side car and extra passenger I carried about 25 pounds of luggage making the total weight about 650 pounds.

The machine never faltered once on the entire trip and to say that I am well pleased with the performance of this model 12C would be putting it very mildly. I have covered over 4,000 miles so far this season without the slightest mechanical difficulty, and anyone who wants a reliable machine for power and endurance should select a Pierce.

Very truly yours,

(Signed) JESSE E. EDSALL.

The
Motorcyclist's
Spare Tire

The
Only Practical
Device on the Market

Diamond Tire Sleeve

No matter what the injury, it's all the same to the man who carries a Diamond Tire Sleeve. It can be applied to any part of the casing in one to three minutes. It fits inside and under the rim instead of over it as does the old lace sleeve. It holds a rim-cut just as effectively as it does a puncture. In case of a blow-out or any other injury that penetrates the fabric, the fabric blow-out patch which accompanies each Diamond Tire Sleeve is applied inside the casing to protect the tube. Both are neatly packed in an attractive box that fits conveniently into tool box or pocket.

SEND FOR OUR BOOK ON TIRE ACCESSORIES. IT'S WORTH HAVING

SUBSIDIARY OF THE B. F. GOODRICH CO.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

Combined Motorcycle Lamp and Generator.

P.E.M. LEADS THEM ALL!

In every race meet in which the P.E.M. has been entered this year, its first season, this wonderful motorcycle has captured the big end of the first and second places. Just read this record—Deeds talk louder than claims.

JANESVILLE, WISC. — Big Decoration Day Meet. Six events; The P.E.M. took four firsts. In event 5, A P.E.M. "single" won by over 13 seconds a 10-mile race against a field of "twins."

MILWAUKEE, WISC., June 8th—The P.E.M. took first in novice, first in Private Owner and Second for Stock Machines (In this latter event the winner was a stripped machine with a trade rider).

OSHKOSH, WISC., June 9th—In Six events on a half mile track P.E.M. won five firsts and two seconds.

There is a reason for this regular consistent winning—and that is the superiority of the P.E.M.—Easy riding on bad tracks because of the "leaf-spring" hung frame.

High powered Engine because of high compression due to overhead valve mechanism. Positive chain drive with free engine clutch.

If you want to be a winner on the track or on the road—you must ride a P.E.M. Write today for booklet and special rider agency offer.

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of June 13 is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I am planning to take a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and I am looking forward to a very pleasant trip.

Yours very truly,
B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waling & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,
CHAS. A. TANGEMAN.

"Extra
Service"

FEDERAL TIRES

Federal Tires are the kind you will like. They are built on the true friend principle—they can be faithfully trusted in any emergency.

This matter of faith has a great deal to do with motorcycle tires—if your tires are the kind that will "stick for the big show" and keep "sticking" when you need them, it means so much to the rider.

Federal Tires are made better and more carefully than other tires—and are of uniform high quality. They will exceed your expectations from a service standpoint every time.

*Give them
a trial.*

Corrugated
Tread

Federal Tires are made in Corrugated and Studded treads in all sizes and in single and double clinch types.

They are supplied through leading dealers everywhere. Interesting tire book mailed on request.

No Need to Soil or Injure Your Hands

When a tire blows out—when your engine balks—keep on your Grinnell Gloves. They are soft and pliable—won't hamper your hands. When soiled you wash them out in soap and water or gasoline. They dry out clean and pliable. They never harden, crack, shrink or peel. Made of soft velvet coltskin, insuring non-slip grip on handle bars. Wear twice as long as ordinary gloves. In

Grinnell Gloves For Motorcycling

you get thoroughbred style. You get the patented "Rist-Fit," the *Ventilated Back*, and other exclusive features of comfort—one of which is the "Grip-tite" double reinforced palm.

Get a Pair on Approval

See Grinnell Gloves at your dealer's. If he hasn't them, write us his name, mentioning size, your preference of color—black or tan—and style desired. We'll send pair on approval, prepaid.

Style Book and Samples of Leather on request

MORRISON-RICKER MFG. CO.

Originators and Patentees of Ventilated and "Rist-Fit" Gloves.

The Motorcycle MANUAL

Is the last word on the subject of a publication giving comprehensively and in a handy form all the information required by a motorcycle rider or dealer. 104 pages, printed on coated paper.

Motorcycle engine and frame parts illustrated and fully described—their functions fully explained, with a remedy for every possible trouble

YOU NEED THIS BOOK

For it also tells you how to tour; gives the motorcycle laws of every state; official racing records, hill climbing, horsepower and other formulae, and a complete directory of the motorcycle trade. Pages are magazine size, 7 x 9 inches.

Paper covers, 25 cents, postpaid. Cloth bound, 50 cents, postpaid. Special prices on lots of 10 or more.

For \$1.25, we will send you a copy of the Motorcycle Manual and also enter your subscription to Motorcycle Illustrated for one year.

MOTORCYCLE ILLUSTRATED, 51 Chambers Street
NEW YORK

"We use thousands of Diamond Chains with absolute satisfaction and believe they are the best made in this country."

That's what the Consolidated Mfg. Co., of Toledo, large manufacturers of bicycles and motorcycles, have to say of Diamond Chains and they know from long experience.

Diamond Chains are and have for 21 years been the recognized standard and have been adopted as such by bicycle makers whose product is of the highest grade. Doesn't this warrant a trial on your part? See that the Diamond trade mark appears on the connecting link when you buy a new chain.

House Orders.

Each order is to be filled before six o'clock or shippers must work over time. We return the money, on any article sent back, at our expense, if not entirely satisfactory, shipments must therefore be correct.

If you want to please me - please our customers.

C. L. Waters, Mgr.

A manufacturer's salesman passing through our warehouse saw the blackboard on which we write the rules that govern the working of our shippers. He said—"If every Motorcyclist were to walk through here and see that board, a whole train would not hold enough supplies to fill their orders. Won't you let me take a photo of it to show the boys why your sales are increasing so fast." ABOVE IS THE BLACKBOARD.

Our big catalog of all-guaranteed supplies is free.—Write for it today.

MOTORCYCLE EQUIPMENT CO., Hammondsport, N. Y.

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

Reduce Repair Bills

Regular and systematic use of an efficient lubricant will keep your motorcycle out of the repair shop. Colonial Oil furnishes the maximum of lubricating efficiency.

COLONIAL MOTOR OIL

Medium Grade

is expressly prepared to meet the conditions of motorcycle lubrication, which differ radically from automobile lubrication.

SILEX GREASE

The greasiest grease made

The real test of a grease is not its looks or the feeling but its lubricating properties. SILEX is made to lubricate and last.

DIAGNOSIS—Ignition Trouble

PRESCRIPTION—One set J-D Visible Spark Plugs

FEE—\$1.00 per plug—money back if not absolutely satisfied

We can cure your Ignition troubles, too. The new principle embodied in the J-D VISIBLE GAP SPARK PLUG enables you to locate and cure Ignition trouble at a single glance.

One look tells everything

Through the port in the porcelain—outside the motor—you see if the spark is jumping the gap in the central electrode. If the spark jumps, but proper ignition fails to follow, then the plug must be foul or the carburetion faulty. If the spark does not jump, then trouble lies behind in magneto or wiring or coil or batteries. Knurled adjusting nut allows you to widen or close gap. Opened, it intensifies spark and cleans point automatically. Uses minimum current, makes timing of engine easy, and permits regulating of spark in any cylinder.

If your dealer has not yet put the J-D VISIBLE PLUG in stock, we will mail you as many as you want, guaranteed, prepaid on receipt of price—just \$1.00 per plug. Write and tell us the size wanted and make of motor.

The *Neverout* Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

**WOULD YOU PAY \$1.00
TO OVERCOME**

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Are You "Afraid to Come Home in the Dark?"

Do you therefore stay close at home, or else creep in slowly, in fear and trembling?

If so, you are missing most of the joy of motorcycling. A **RELIABLE** source of light, with a lamp large enough, will make night riding pleasant and **SAFE**.

A gas generator won't fill the bill, because it is not reliable, and is also a troublesome nuisance. Neither will small generator lamps meet your requirements.

Prest-O-Lite is your **ONLY** source of satisfaction—the **ONLY** practical lighting system for motorcycles.

Floods the road far ahead with brilliant light, **STEADY**, unflickering under all conditions. Turned on and off like a gas jet.

Shows up the bumps, ruts, puddles, etc., as no other lighting system can do.

Wherever you may be exchange service may be had from one of our 20,000 dealers (motorcycle and automobile). We will arrange for prompt service for anyone, anywhere.

Expensive? Not at All!

Any experienced rider will tell you that Prest-O-Lite service costs no more—usually costs less—than the carbide a generator consumes.

Price of Tank \$10

(Equipped with gauge.)

Dimensions: Length, 13¾ inches; diameter, 4 inches; weight, 8¾ pounds. 40 hours of light. Easily attached to any motorcycle.

MR. DEALER: It requires only a little effort for you to increase your Prest-O-Lite business. The plain **FACTS** about Prest-O-Lite, told to your customers, will make sales.

And don't get your customers into the habit of going elsewhere for Prest-O-Lite exchanges if you want to retain their trade on other things.

Prest-O-Lite Owners

Excelsior Motorcycle equipped with PREST-O-LITE.

Prest-O-Lite

MOTORCYCLE GAS TANK

And the money you invest in the tank itself is not **SPENT**, because a genuine Prest-O-Lite Tank never gets to be second-hand, is always in demand, and is always a **READY CASH ASSET**.

No rider can afford to be without this combined **CONVENIENCE, PLEASURE** and **INSURANCE**. One accident due to poor light might cost you more than a year of Prest-O-Lite service.

Don't Let Anyone Cheat You With an Imitation

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one **ANYWHERE** and **ALWAYS**. Imitations cannot. The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank gets the best of you. Don't let him! We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

The Prest-O-Lite Company 245 East South St. Indianapolis, Ind.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service. **EXCHANGE AGENCIES EVERYWHERE**

The Roughest Roads Look Smooth to Riders of

AT least they seem smooth to the rider of the only spring frame and spring fork motorcycle. Two powerful springs encased in the rear stays and a hinged joint at the pedal crank axle, permit the rear wheel a play of four inches without change of saddle position. The "Flying Merkel's" remarkable comfort features, powerful ball-bearing motor and wonderful reliability have made the mount so popular, we've had to build a quarter of a million dollar addition to our already enormous plant to keep up with the demand.

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and gives maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen 1/4-inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

Flanders
MOTORCYCLES

\$175

**At the
Factory**

While the Flanders "4" always gives an account of itself when entered in a race, it really is built especially for the road. And you can bank on a Flanders to give you the best possible service at all times and under every conceivable condition.

Before leaving the factory every Flanders "4" is put through a most severe test, insuring perfection in every detail. And when the machine gets on the road, we know that the service will greatly surpass even the expectations of the buyer.

The Flanders "4," whether for pleasure or commercial use, will always give the utmost service. It is reliability in itself, and if looking for a machine that will give absolute satisfaction at all times, the Flanders "4" is it.

At \$175 at the factory, the Flanders "4" is the best value on the motorcycle market. The machine is in every respect equal to others selling for \$50 more. But our facilities, our vast experience in building automobiles and motorcycles, make this low price for so high grade a machine possible.

FLANDERS MANUFACTURING COMPANY

PONTIAC, MICHIGAN

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the Motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

YOU SHOULD KNOW

What Schickel Valveless Two-Stroke Means

Not so long ago the motorcycle rider was well satisfied with a mount that could show some speed and climb hills fairly well—these were the prime requisites.

Education has wrought some mighty changes in a short space of time and we find the average rider of today looking for something more than speed and ability to climb hills.

His request of today will be a demand tomorrow—his new mount must have power, but also it must be simple, silent, easy riding and attractive.

The Schickel Valveless Two-Stroke Motor

POWER

5 H.P.—\$225

SIMPLICITY

Only 3 moving parts with large bearing surfaces make up the entire mechanism of the motor.

The Schickel oiling system lubricates perfectly without the use of gears, pumps, sight feeds, pet cocks or separate oil tank.

SILENCE

There are no valves to break or bang shut in a Schickel motor.

There are no gears to set up an incessant and annoying rattle.

SMOOTH RUNNING

The Schickel motor delivers a power impulse to each piston stroke. The flywheel is given a running balance and this results in an almost total lack of vibration at all motor speeds.

Schickel Valveless Two-Stroke Means—Power-Simplicity-Silence-Smooth Running

Dealers who have felt the sting of keen competition are invited to open correspondence with us.

The Kansas Short Grass Tour—Fording Smoky Hill
River—Snapshots of Busy Tourists

Q A BACK-WOODS carpenter with a saw and hammer can build a fairly acceptable hen house, but it takes fine tools and skillful co-operation to build a sky-scraper. Which only serves to emphasize the important fact that the *big* things, *real triumphs* of the modern world, are accomplished through co-operative effort.

It, therefore, isn't surprising that in the present highly developed state of the motorcycle industry the only brand of tires produced through co-operative methods of manufacture should predominate.

All of the tremendous resources of the United States Tire Company are devoted to the manufacture of ONE SUPERIOR BRAND OF TIRES, which are not only co-operatively made, but co-operatively tested as well.

United States Motorcycle Tires represent the combined producing facilities of four of the most magnificently equipped and most expertly operated tire factories in the world. Four separate corps of tire specialists direct their manufacture. They combine all of the tried and proven service-qualities of two brands of motorcycle tires, each of which was years ago recognized as a standard of quality.

In tires made as the United States Motorcycle Tires are made there is co-operation in actual manufacture, co-operation in methods governing manufacture, and, co-operation in assembling the individual features going to make up the aggregate of service-yielding qualities in each tire.

It is inconceivable that tires so made should not render the maximum of mileage service at the minimum of final cost.

NO. 17

AUGUST 22, 1912

RAIN HAMPERS SHORT GRASS TOURISTS

A Series of Deluges Turned Roads Into Quagmires—Better Conditions in Colorado—Fifty-two Riders Left Garden City

COLORADO SPRINGS, Colo., Tuesday, August 20.—The Short Grass Tourists, who left Denver this morning, spent the day here sight-seeing.

THE third annual tour of the Short Grass Motorcycle Club, with fifty-two starters, left Garden City, Kansas, on August 11. A severe rain and hailstorm, which swept over Garden City and vicinity, causing several washouts and making it almost impossible to get over the roads, kept at least fifty more starters from joining the tour. The first rider left Garden City at 6:50 a. m., which was fifty minutes behind schedule time. The weather was ideal for the first two hours, but on leaving Scott City, Kan., a seemingly endless desert was encountered, and it was expected at any time to see one of the riders tumble over, so intense was the heat. About two hours after leaving Scott City the party reached Smoky Hill river, which was found to be two feet deep. There being no bridges, it was impossible to ride across, so off came shoes and stockings and the entire party waded across, carrying their machines. The nine accompanying autos were pulled across by a team of mules and about twenty-five riders. The roads were very rough

between Smoky Hill river and Oakley, Kan. Dinner was served at the latter town.

The desert, as viewed by the tourists from a high hill just before reaching Smoky Hill river resembled very much a lake where nothing but horizon can be seen.

Smoky Hill is well known, as it is the historical place where the Smithsonian Institute has gathered many relics of petrified specimens.

The party left Oakley at 7 a. m. and was escorted by a number of the local boys, as a detour had to be made on account of the many washouts. The next stop was made at Colly, Kan., where several new riders joined the tour. After a short stop the procession headed for Atwood, Kan., where they stayed over night. Roads still very poor. The second day the tour left Atwood, Kan., at 9 a. m., the delay being caused by Dr. Patterson going fifty miles to see his sick father.

The tents and other paraphernalia, shipped to Atwood by train, arrived O. K., but could not be taken away, as the truck which was to be used could not be located, having been stalled somewhere. The roads were full of sand and ruts.

At Stratton the Harley-Davidson baseball team defeated the locals, the score being 8 to 6. The rest of the party did not wait to see the

Photographic Story
of the
Kansas Short Grass Tour

game, but kept moving till they reached Waneda-on-the-Lake, where they ate dinner. The ball players followed later and arrived at Imperial, Neb., where they were beaten by the Imperials; score, 7 to 4. Races and ball game over, the tourists lost no time in getting to bed.

They left Imperial at 6:15 a. m., bound for Julesburg. The road between Imperial and Samar, a distance of twenty-five miles, was practically unridable; however, the boys were determined to make it at all hazards. The ruts were eighteen inches deep in some places. Reed Pitcher, of Kansas City, Mo., riding a 4 Indian, dislocated his right foot, and was forced to discontinue his trip and go by train to Kansas City. S. C. Rosenberg, of the Harley-Davidson crowd, also had a bad fall, which opened his face about two inches under his left eye and strained his left shoulder. It was sheer grit that enabled him to ride from Samar to Holyoke, where a doctor dressed his wound. He then shipped his machine back to the factory and continued the tour by train.

The tourists arrived at Julesburg at 11 a. m. Here the Harley-Davidson ball team was again beaten. Next on the program was an auto

Charles Fuller Gates, one of the Tourists.

race between a Hudson 30, driven by one of the tourists, and a local Ford. The Ford car went dead in the fourth mile.

At 2:30 the tourists left Julesburg for Sterling, Colo., a sixty-mile run. The first division reached Sterling just ahead of a heavy rain storm, which lasted three and a half hours. The less fortunate ones had considerable trouble in getting in at all. With the exception of one car, none reached Sterling that night after the first division, which arrived at 6 p. m. The first of the stragglers appeared at 8 o'clock the following morning, but the last one did not reach town until 11:30 a. m. Several of the company had to sleep in a barn and others in a farm house, while the rest managed to reach Iliff, a small town about fifteen miles from Sterling. Farm wagons were kept busy for six hours, as it was impossible to ride after the rain. Several of the autos came near going into the ditch on account of the slippery road conditions. The Sterling people had a nice dinner ready for the tourists, and it was held over till the next night (Wednesday), on account of their late arrival. Wednesday was an enjoyable day for both the tourists and the Sterling inhabitants. They had some interesting races and a ball game,

which was won by the local club; score, 3 to 2. At 9 p. m. all enjoyed a dance with the Western girls. The only thing lacking to make it a real Western dance was the fact that it was held in a dance hall instead of a barn.

The Starters.

The starters from Garden City were: Geo. Puls, Milwaukee, Wis.; Martin Hausen, Beloit, Kan.; W. R. Gaines, Beardsley, Kan.; M. G. Bennett, Haviland, Kan.; E. C. Griffith, Haviland, Kan.; Arch. Baumenter, Haviland, Kan.; P. C. Harrier, Netawaka, Kan.; R. Silvester, Garden City, Kan.; E. I. Gully, Haviland, Kan.; R. Buchanon, Kiowa, Kan.; Will Holcomb, Atwood, Kan.; W. W. TOUR SIDE-LIGHTS.

SEVERAL tourists, led by Roy Bowser, voted to grow small mustaches in recognition of the Short Grass Motorcycle Club.

SEVERAL accidents were caused by ped- als catching in the sides of deep ruts.

MISS INEZ PATTERSON, sixteen years of age, deserves credit for her excellent riding. She went through spots which the best riders failed to make without a spill.

THE occupants of the Goodyear Tire Car, in charge of H. S. Quinn, of the Goodyear factory, and Edw. E. Flippen, Jr., manager of the Kansas City branch, and driven by Geo. L. Schofield, Kansas City manager for the American Automobile, had their hands full. They not only gave out tubes and casings, but never passed a rider on the road without giving him aid. The car is an American "Thirty," and a

four-passenger, but at times it carried as many as seven and enough motorcycle parts to build an entire machine. Mr. Schofield is somewhat of a motorcycle enthusiast, as he was connected for several years with E. H. Dowd, who is now managing the Armac Motor Co.

P. E. ZIMMERMAN, manager of the P. Hagstrom Bros. Mfg. Co., of Lindsborg, Kans., was on hand at Garden City with a full line of spark plugs, pennant holders and inner tubes. He went as far as Oakley.

IN the Marmon car were Louis M. Tower, secretary and general manager of the McQuary-Tower Manufacturing Company, of Lawrence; Clem Perkins, treasurer of the firm, and his brother, R. M. Perkins. The official uniform of the club was supplied by this company. The officers' apparel is of imported gabardine and that of the regular riders of government shelter cloth. The car is decorated with khaki advertising banners and a clever tag showing the route is distributed at every stop. The M-T car has battled with bad roads from the morning of the start from Lawrence in a driving rain. From Toledo to

Amateur Race at Sterling.

Salina they took the Golden Belt route, which in dry weather is excellent, but after an all-night rain was taken on second speed most of the way. Salina to Hutchinson on the Meridian road was dry and speedy, but to Dodge City the road was muddy and rough, and worse than that between Dodge City and Garden City. Five bridges were washed out and mud holes were continually encountered. This was on the south side of the Santa Fe; on the north side roads were better, although a cloudburst had washed down the hills, making gullies in the road and mud holes for miles that necessitated detours through pasture-land.

Out of Garden City the M-T car was delayed waiting the arrival of club express matter, and left there hours behind the riders, headed for Atwood. The roads were smooth as a floor and the big Marmon hit only the high places.

At Smoky Hill River the car stuck in mid-stream owing to the springs being down flat with express packages. Assistance finally came in the shape of a spring wagon drawn by two husky horses, and after three hours tugging, with four men at the wheels, the car proceeded on its way, making a mile detour over hills, on account of mud holes, into Colby at 10 p. m., central time.

TOURISTS REACH DENVER.

THURSDAY, August 15.—The tourists left Sterling at 7 o'clock this morning after having had a good rest. Rain the previous night made road conditions very bad. When wet, western roads become miry, or what is termed gumbo, which is worse than mud, as the water remains on the surface.

Behind schedule in Cheyenne, but in time to see a real Wild West show.

A rain storm which came up just before the travelers reached Cheyenne made it necessary for some of the party to sleep on the desert; they reached Cheyenne the next morning.

Miss Inez Patterson, who had covered 600 miles, was tired and ill. There being no one else to ride her machine, Dr. Patterson, though suffering from a dislocated shoulder, undertook the ride, which was over 100 miles. He was forced to go to bed immediately upon reaching Cheyenne.

After a stay of two nights and a day in Cheyenne a start was made for Denver at 6 a. m. Saturday. The roads between Cheyenne and Denver were very good, in fact, the best encountered. The party rode into Denver at 2 p. m., having covered 110 miles since leaving Cheyenne.

The Goodyear tire car left Cheyenne several hours later than the main party, but arrived in Denver only half an hour behind, having averaged 35 miles an hour.

After hotel accommodations, etc., had been secured the tourists were waited upon by the Governor of Colorado. A pleasant evening was spent at White City.

Sunday morning a sight-seeing trip through Denver was enjoyed by the tourists, and at 11 a. m. they had their pictures taken. In the afternoon all went to Tuilleries track to see the racing on the boards.

Monday, August 19.—After a short rest the tourists enjoyed a train ride 100 miles up the mountains to Glacier Park, where they saw the most beautiful scenery on the route. The Short Grass Club furnished refreshments of all kinds. By 6 o'clock all were back in Denver. This was the most enjoyable day of the trip. In the evening all went to City Park, the finest in Denver.

Concerning Some of the Tourists.

WH. KNAR, Thor agent at Beloit, Kan., joined the tour at Atwood. He was accompanied by Mrs. Knar.

PAUL WARNER, president of the Short Grass Club, was the first rider to own a twin machine in the State of Kansas. On one of the tours of the Short Grass Club Warner was called Kickapoo Wopple Pop, chief of the Yew Yew Tribe. Warner has with him on this year's tour Miss Edna Ford, his bride-to-be.

NOT to be outdone Wells Bennett also had his intended on the tour.

A. W. STEVENS, employed at the Denver branch of the Hendee Manufacturing Company, is the young fellow who would rather not go on a tour if he had to pass a man in trouble without giving help.

THE Julesburg people showed the boys a great time, but the opinion was that they had nothing on Sterling.

WE. JOHNSTON, manager of the Hendee Denver branch, gave a dinner party for the tourists Sunday noon.

AT Cheyenne, while the tourists were watching the broncos, several made mention of the fact that the "busters" had something to learn from the Short Grass tourists.

INEZ PATTERSON'S EXPERIENCE.

FRIDAY, August 9, 1912.—Left Pratt for Garden City. Had two spills east of Greensburg. Reached Cimeron after dark, where she stayed overnight. Met Paul Warren and Miss Ford at Cimeron. Met Topeka and Salina boys on way to Garden City.

August 10.—Encountered bad roads between Cimeron and Garden City, arriving at the latter place in time for dinner. Went to track to see races. Toured city in auto.

August 11.—Roads at start of tour fair and partly bad. Secured oil and gas at Scott City. Encountered bad roads after leaving Scott City and had to wade across Smoky Hill River. Good roads to Oakley, where dinner was served. Riding to Colly was also good, but not so to Atwood, at which place tourists did not arrive till dark.

August 12.—Left for Stratton at 9:30 a. m., roads again being disagreeable. Had a good time at Stratton. One fall on the way to Wanada, where they ate dinner. Three spills on way to Imperial, roads being very bad. Arrived on time.

August 13.—Up at 4 o'clock. Left Imperial for Julesburg; roads still very poor. One tumble. Had a chicken dinner at the park. Started for Sterling at 2:30 p. m. About two miles out two-speed went to the bad and was towed for six miles. After fixing two-speed again resumed journey. Met two Sterling people fifteen miles out of Sterling. Stopped on road on account of rain. Put machine in wagon and continued to Sterling in auto, but got stuck in mud eight miles from Sterling. A passing hay rack was used to reach a farm house, where dinner was obtained. Phoned to Sterling for a buggy, but had to stop at farm over night. Fixed up auto in the morning and came on to Sterling.

NEW ORLEANS RACES.

AT the Firemen's Festival, held at the New Orleans (La.) Fair Grounds, three motorcycle events were run off on August 11, a ten-mile for twins, and two five-mile events for singles.

In the twin-cylinder motorcycle event O. Vantayer, a New Orleans boy and a well-known amateur rider, covered the ten-mile course in 14:54½ in true dare-devil fashion. Vantayer's riding was of a spectacular nature, and upon his completion of the ten miles the little Frenchman was roundly applauded. In the five-mile single-cylinder, free-for-all race, J. A. Sterken was thrown from his machine and sustained a broken nose and cuts and bruises about the face and body. Charles Paretti and J. A. Sterken had been running neck and neck in the fourth lap of the race, and Sterken attempted to pass Paretti in the three-quarter turn. As he swerved his machine he apparently became temporarily blinded by the dust, and ran his front wheel into the back wheel of the leading machine. Following are the summaries:

Five-mile single cylinder event—Charles Paretti, first; J. A. Sterken, second; Leo Sutter, third. Time, 8:32.

Ten-mile twin cylinder event—O. Vantayer (Indian), first; O. W. Fenner (Flying Merkel), second; W. Elbert (Indian), third. Time, 14:54½.

Five-mile single cylinder free-for-all event—Charles Paretti (Indian), first; Leo Sutter (Indian) second.

RED HEAD PLATINUM POINT PLUG.

AFTER nearly a year of experiment at the hands of ignition experts, the Red Head Platinum Point Magneto Plug is at the service of spark plug users.

For the information of those whose curiosity has been aroused by the unique card which was mailed to the trade to announce its birth on July 4, and by the memory-teasing bullet-shaped advertisements which have been scattered throughout the advertising pages of trade journals, it may be stated that the latest addition to the happy family of Red Heads bears a striking physical resemblance to its older brothers. To avoid confusion, the Platinum Point plug has been marketed with a double-dipped and highly polished nickel-plated shell, bushing and cap.

Of course, the plug bases its middle names upon the fact that the center electrode has a solid platinum point. One of the reasons why this plug has been so long in making its appearance is that it took months to perfect the process for welding the platinum up to the center electrode. The platinum used is 1-32 of an inch thick and flows back 1-32 of an inch. As the liberal use of this grade of platinum (which is more costly than the purest gold) indicates, no expense has been spared to bring the Red Head Platinum Point Plug up to the high state of efficiency.

Another innovation is a combination screw top and magneto type terminal. This terminal will accommodate snap, ring or slip cable connections of all sizes and designs.

So successful has the simple and substantial Red Head construction proven in racing cars ranging from 30 to 210 h. p., and showing compression as high as 90 pounds, that well enough has been let alone and consequently no change is apparent in the design of the shell or bushing. And the Red Head porcelain has also given splendid evidence of its stamina.

A MILE IN 37.

COLUMBUS, O.—A new half-mile track record was hung up at the Sunday afternoon races at the motordrome when Ray Seymour, the speedy California rider, negotiated the mile in 37 seconds flat. This is within one-fifth of a second of the world's record made on the mile board track at Los Angeles. The Columbus saucer is a half-mile in circumference. The Sunday meet was the best since the completion of the motordrome. The starters were numerous and the finishes were generally close and exciting. Excellent time was made.

L. P. Birkenbach finally won the Columbus Motorcycle Club cup, which now becomes his permanent property, he having won it three times. The two previous winnings were on the dirt track at Columbus. In the final brush Birkenbach was hard pushed by George Evans, but won out in the third heat.

The trade riders event, also run in three heats, was an interesting race, and won by Evans. In the professional races, Seymour showed himself faster than Balke and won the big event of the day. The attendance was large, and the track managers are optimistic.

BRIGHTON RACES

FLECKENSTEIN FAILS TO DEFEAT CHAPPLE.

Johnnie Albright Cleans the Board in the Professional Races.

SATURDAY, August 10.—Larry Fleckenstein, the Salt Lake City speed marvel, failed in his attempt to lower Arthur Chapple's colors in the feature race of the evening at the Brighton Stadium Motordrome. In the first heat the riders raced abreast for three miles, when Fleckenstein was forced to quit because of carburetor trouble. In the second heat he had his motor running beautifully and put up a spectacular race. Taking the lead at the start, he maintained it until the bell lap, when Chapple nosed his wheel ahead at the tape and won by a fraction of a wheel length.

Johnnie Albright had an easy time of it in the first heat of the six-mile professional race, lapping the other riders in the last mile. In the second heat he was forced to his utmost speed by Billy Wray, and won only by inches. In the third heat, after leading the bunch for four miles, his motor began to miss. He dropped back to last position, and finished there.

Albright rolled up a total of eleven points. Wray was second with ten points to his credit, and Lockner third with eight.

Howard Wray, brother of Billy Wray, the "pro." rider, made his debut as an amateur racing star by winning the two heats in which he was entered in, in each case defeating J. B. French, his nearest competitor, by a comfortable margin.

The ten-mile handicap race brought out the classiest riders of any race held at the Motordrome. Chapple was scratch, Johnnie Albright had one lap, Billy Wray two laps, and Mercier and Lockner three laps each.

The race was an exciting one from start to finish. Lockner just won out over Chapple; Ferdie Mercier was third and Billy Wray fourth. The summaries:

Three-mile amateur handicap race; open; 61:00 class—First heat—Won by J. B. French, Brooklyn (Indian), scratch; second, J. Doeffler, Brooklyn (Merkel); two laps. Time, 2:25½. Second heat—won by Howard Wray, Brooklyn (Indian), scratch; second, J. B. French, Brooklyn (Indian), scratch; third, J. Doeffler, Brooklyn (Merkel); two laps. Time, 2:22¾. Third and final heat—Won by Howard Wray, Brooklyn (Indian), scratch; second, J. B. French, Brooklyn (Indian), scratch; third, J. Doeffler, Brooklyn (Merkel); two laps. Time, 2:17½.

One-mile record trial by Arthur Chapple—Time, 39½; lost.

Six-mile professional race; open; 61:00 class—First heat—Won by J. Albright, Denver (Indian); second, George Lockner, Syracuse (Indian); third, Wm. H. Wray, Brooklyn (Indian). Second heat—Won by J. Albright, Denver (Indian). Time, 4:20¾; second, Wm. H. Wray, Brooklyn (Indian); third, George Lockner, Syracuse (Indian). Time, 4:47½. Third and final heat—Won by Wm. H. Wray, Brooklyn (Indian); second, George Lockner, Syracuse (Indian); third, Ferdie Mercier, Brooklyn (Indian); fourth, J. Albright, Denver (Indian). Time, 4:39¾.

Special four-mile match race (between Arthur Chapple, of New York, and Larry Fleck-

enstein, of Salt Lake City)—First heat—Won by Arthur Chapple; Fleckenstein out. Time, 3:00¾. Second heat—Won by Arthur Chapple by 2 yards. Time, 3:00¾.

Ten-mile professional, handicap race; open; 61:00 class—Won by George Lockner, Syracuse (Indian), three laps; second, Arthur Chapple, New York (Indian), scratch; third, Ferdie Mercier, Brooklyn (Indian), three laps; fourth, Wm. H. Wray, Brooklyn (Indian), two laps; J. Albright, Denver (Indian), out—carburetor trouble. Time, 7:01¾.

Wray Captures One-Hour Race.

BROOKLYN, N. Y., August 11.—Billy Wray, the Brooklyn "phenom" who has been consistently winning at the Brighton Stadium Motordrome, annexed the feature race of the season by winning the one-hour professional from a classy field.

Eight riders were on the program for this event, but only five faced the starter, viz.: Arthur Chapple, Johnnie Albright, Wm. H. Wray, George Lockner and Wm. R. Shields. Chapple led at the start with all the other riders closely bunched. Shields quit in the first mile with engine trouble. At the sixth mile Chapple's engine began to miss and he was forced to stop. Quick adjustments were made and he was off again. Albright had shot into the lead and Chapple set out to catch him, but was forced to stop twice in the next fifteen miles, and had to quit at the twenty-second mile when his engine ran hot.

Johnnie led at the quarter hour with nineteen miles to his credit. Billy Wray had eighteen miles and Lockner 17 miles and one lap. Lockner was forced to stop after riding for half an hour. He was on again as soon as his tanks had been replenished.

During the next quarter hour Albright led by a safe margin. Wray and Lockner alternated at pacemaking each other, riding at a terrific pace. At the beginning of the last fifteen-minute period Albright was seen to suddenly slow down and finally stop. His driving chain had broken after he had covered sixty-five miles. He took another machine and tried to hold his lead, but his mount was not in perfect order and he again stopped at the sixty-seventh mile. Billy Wray took the lead and led the rest of the way to the finish, winning by a mile and a half over Albright. Lockner was third, with sixty-five miles and one lap. Throughout the race Wray made only one stop, when he replenished his oil and gasoline supply at the fifty-fourth mile. On the last lap Lockner, in slowing down, ran off the track into the infield, and in attempting to mount the track again he had a fall which shook him up considerably. He had become dazed and had to be supported from the track.

The other races were cut to a three-mile amateur event, which went to Johnnie Constant and one final heat of the five-mile professional race. Billy Wray also won this event by a foot over George Lockner.

Howard Wray had a spill in the first heat of the amateur race. He slid for 50 yards before he could stop. Luckily he only received a few bruises. The summaries:

Three-mile amateur race; open; 61:00 class—First heat—Won by John U. Constant, Brooklyn (Indian); second, J. B. French, Brooklyn (Indian); Howard Wray, Brooklyn (Indian), fell. Time, 2:29¾. Second heat—Won by John U. Constant, Brooklyn (Indian); second, J. B. French, Brooklyn (Indian); Howard Wray did not start. Time, 2:25½.

Five-mile professional race; open; 61:00 class—Won by Wm. H. Wray, Brooklyn (Indian), by one-half wheel; second, George Lockner, Syracuse (Indian); third, Ray Hofstatter, Indianapolis, (Indian). Time, 3:53 flat.

One-hour professional record race; open; 61:00 class—Won by Wm. H. Wray, Brooklyn (Indian), 69 miles, one-half lap; second, Johnnie Albright, Denver (Indian), 67 miles, 2½ laps; third, George Lockner, Syracuse (Indian), 65 miles, 1 lap; Shields out first mile; Chapple out twenty-second mile.

BRIGHTON RACERS IN MISHAPS.

Chapple Dislocates Shoulder and King Is Severely Burned.

BROOKLYN, N. Y.—Tuesday, the 13th, was a bad night for the Brighton speedsters. On the first lap of a two-mile record trial Arthur Chapple was thrown from his machine when his front tire blew out. He was traveling at a rate of 90 miles an hour, and sustained a dislocated and torn shoulder. Dr. Thompson, the track physician, stated that Chapple would probably be able to ride again on Sunday.

F. A. King, of Kansas City, was severely burned about the legs when his clothing caught fire from the exhaust of his engine in the first heat of his match race with Johnnie Albright. King fell from his machine and before he could wrench his leggings off, the blaze had burned through to his leg, searing it badly. Johnnie Constant put the fire out with a hand fire extinguisher. After King's burns had been dressed he pluckily rode out the next two heats of the match race.

Johnnie Albright carried off the honors of the match race, winning two heats out of three. He repeated his performance in the Bruce Brown eleven-mile handicap by winning over Billy Wray, his nearest opponent, by a third of a lap. Wray had two laps' handicap.

Howard Wray was suspended for his weird riding in the first heat of the amateur race. Summaries:

Three-mile amateur race; open; 61:00 class—First heat—Won by John U. Constant, Brooklyn (Indian); second, Howard Wray, Brooklyn (Indian); third, J. B. French, Brooklyn (Indian). Time, 2:50¾. Second heat—Won by Constant; second, French. Time, 2:23¾.

Six-mile race; professional; open; 61:00 class—First heat—Won by Ferdie Mercier, Brooklyn (Indian); second, Billy Wray, Brooklyn (Indian); third, Ray Hofstetter Indianapolis (Indian). Time, 4:32¾. Second heat—Won by Hofstetter; second, Wm. R. Shields, Syracuse (Indian); third, Wray. Time, 4:36¾. Final heat—Won by Mercier; second, Wray; third, Shields. Time, 4:30¾.

Four-mile match race (between Johnny Albright, Denver, and F. A. King, Kansas City)—First heat—Won by Johnny Albright. Time, 2:57¾; second heat, three miles—Won by F. A. King. Time, 2:10¾. Final heat, three miles—Won by Albright. Time, 2:12¾.

Eleven-mile professional handicap race; open; 61:00 class—Won by Johnny Albright, Denver (Indian), scratch; second, Wm. H. Wray, Brooklyn (Indian), two laps; third, Ray Hofstetter, Indianapolis, two laps (Indian). Time, 7:59¾.

THE Springfield (O.) M. C. will hold a race meet Labor Day, September 2, 1912.

MORE ACCIDENTS AT BRIGHTON.

Four Riders in Spill When Shields Collides with Hofstetter.

BROOKLYN, N. Y., August 16.—At the same unlucky spot where Arthur Chapple had taken a spill Tuesday, four riders had a serious mix-up when W. R. Shields, of Syracuse, collided with Ray Hofstetter, the Indianapolis pilot. Hofstetter (more familiarly known as "hotstuffer") was setting a slow pace on the first lap of the five-mile professional race, with all the other riders close behind. Shields, in attempting to pass Hofstetter, slid against him and both fell. George Lockner could not avoid the riders and he crashed into them. Ferdie Mercier ran off the track into the infield and was thrown among the weeds. Billy Wray was far enough behind to speed up, climb the bank and thus escape a fall. Shields was insensible when picked up. He was quickly revived, and his sole injury was a wrenched left shoulder. Hofstetter had contusions of the leg. Lockner and Mercier escaped unhurt.

Wray and Mercier were the only riders able to re-enter the race and they put up a good race, Wray winning by a length in 3:18½.

Johnny Albright "came back" by winning the fifty-mile race. Wray was a strong contender until the twentieth mile, when he was forced to quit because of a broken oil pipe.

Ferdie Mercier was unable to stand the continuous grind, and at the twenty-fifth mile stopped to rest, as his hands and feet were numb. He lost two miles before he resumed riding.

Albright was far in the lead and kept increasing it, ultimately winning by a margin of six miles and two laps over Mercier, who was second. Summaries:

Five-mile professional race; open; 61:00 class—Won by A. H. Wray, Brooklyn (Indian); second, Ferdie Mercier, Brooklyn (Indian). Time, 3:18½.

Three-mile race; amateur; open; 61:00 class—First heat—Won by James B. French, Brooklyn (Indian); second, John U. Constant, Brooklyn (Indian). Time, 2:25½. Second heat—Won by John U. Constant; second, James B. French. Time, 2:26½.

Fifty-mile race—Won by Johnny Albright, Denver (Indian); second, Ferdie Mercier, Brooklyn (Indian). Time, 39:17½.

HASHA GETS TRACK RECORD.

BROOKLYN, N. Y., August 17.—Driving his machine at the rate of over 96 miles per hour, at the Brighton Stadium Motor-drome, Eddie Hasha, the Texas speed marvel, established new records for the track for two, three and four miles, when he defeated Mike Costello, the New York pilot, in straight heats in their four-mile special match race.

Hasha covered the first mile in 39 seconds flat, the second in 37½ seconds, and the third and fourth miles in 37½ seconds each. The best previous track record for four miles, held by Thomas, of Philadelphia, was beaten by 9½ seconds, and the one-mile track record, held by Arthur Chapple, was lowered 1½ seconds.

Costello, whose machine ran badly, was completely outclassed, Hasha winning each heat by over three-quarters of a mile. Hasha's time was only 1½ seconds behind the official record for four miles, held by Ray Seymour, of Los Angeles, Cal.

Billy Wray, the local speedster, sprung a

surprise when he showed his heels to George Lockner, of Syracuse, in a special four-mile match race, after losing the first heat. Wray won the second heat when Lockner was forced to quit on account of engine trouble. In the final heat Lockner contested every foot of the distance, only to lose by inches on the final lap. Lockner finished the last two laps on a flat tire.

Johnny Albright cleaned the boards in the six-mile professional race, winning each heat by a spurt on the final lap. Mercier carried off second honors. Summaries:

Special four-mile match race between Wm. H. Wray, of Brooklyn, and George Lockner, of Syracuse—First heat—Won by George Lockner (Indian). Time, 3:07½. Second heat—Won by Wm. H. Wray (Indian). Time, 3:12½. Third heat—Won by Wm. H. Wray (Indian). Time, 3:05½.

Six-mile professional race; open; 61:00 class—First heat—Won by Johnny Albright, Denver (Indian), first; Ferdie Mercier, Brooklyn (Indian), second; George Lockner, Syracuse (Indian), third; Wm. H. Wray, Brooklyn (Indian), fourth. Time, 4:24½. Second heat—Won by Johnny Albright, Denver (Indian), first; Ferdie Mercier, Brooklyn (Indian), second; George Lockner, Syracuse (Indian), third; Wm. H. Wray, Brooklyn (Indian), fourth. Time, 4:25½. Final heat—Won by Johnny Albright, Denver (Indian); Ferdie Mercier, Brooklyn (Indian), second; Wm. H. Wray, Brooklyn (Indian), third. Time, 4:22½.

Special match race (four miles) between Eddie Hasha, Texas, and Mike Costello, of New York—First heat—Won by Eddie Hasha (Indian). Time, 2:40½. Second heat—Won by Eddie Hasha (Indian). Time, 2:31½.

Attendance—8,000.

CHAPPLE DEFEATS COSTELLO.

BROOKLYN, N. Y., August 18.—Arthur Chapple defeated Mike Costello in straight heats of their special three-mile match race. Chapple raced away from Costello in the first heat, gaining a lap and winning in 2:01½.

The second heat was hotly contested for one mile, when Chapple drew away. Time, 2:05½.

Ferdie Mercier carried off the honors in the six-mile professional race, winning two heats and finishing second in the other. The second heat was the first event on this track in which no rider covered the entire distance. George Lockner could not start, as his tank had been split when Charles Groning, who was using it, fell in the first heat of his match race with Howard Wray. Billy Wray had chain trouble and Mercier stopped on the fifth mile. Mercier easily defeated Wray in the final heat, winning by three-quarters of a lap.

Charles Groning crashed into Howard Wray on the first lap of their special match race. Groning was thrown into the infield and received contusions. His machine was rendered useless. Wray escaped injury. The other heats were called off.

The handicap race was cut to nine miles. Four starters faced the flag, with Chapple scratch, Costello and Mercier being conceded two laps, and Billy Wray three.

Chapple rapidly overhauled the field with the exception of Ferdie Mercier, who rode an exceptionally good race. Mercier hung close to Chapple until Chapple put on a sudden burst of speed in an endeavor to make up the lap which separated him from his opponent. The distance was short, however, and Mercier

flashed home the winner by half a lap. It was a great race. Summaries:

Six-mile professional race; 61:00 class; open—First heat—Won by George Lockner, Syracuse (Indian); Ferdie Mercier, Brooklyn (Indian), second; W. H. Wray, Brooklyn (Indian), dropped out. Time, 4:28½. Second heat—Won by Ferdie Mercier, Brooklyn (Indian), four miles, one lap; W. Wray and George Lockner quit. Time, 3:16½. Final heat—Won by Ferdie Mercier, Brooklyn (Indian); W. H. Wray, Brooklyn (Indian), second. Time, 4:37½.

Special match race between Arthur Chapple, of Brooklyn, and Mike Costello, of New York—distance, three miles—First heat—Won by Arthur Chapple. Time, 2:01½. Second heat—Won by Arthur Chapple. Time, 2:05½.

Special nine-mile handicap race—Won by Ferdie Mercier (Indian), two laps; Arthur Chapple (Indian), scratch, second; Mike Costello (Merkel), two laps, third; W. H. Wray, three laps, fourth. Time, 6:17½.

AUGUST 20TH SUMMARIES.

BROOKLYN, N. Y., Aug. 20.—A heavy mist caused Arthur Chapple to take a serious spill on the first lap of a two mile exhibition race.

He was caught under the machine, sliding for a distance of over 100 yards. When picked up he was unconscious, his left shoulder, which had not yet healed from his previous injury, was again dislocated, and he also received internal injuries.

The final heat of the six mile professional race was the scene of another bad mix-up. Ferdie Mercier and Howard Wray crashed into one another, and Wray had his foot caught in the chain. His shoe was ripped off and his ankle fractured. Mercier escaped unhurt.

Johnny Constant won both heats of the amateur race in handy style. Mercier won the first heat of the six mile professional race, and Mike Costello the second. Larry Fleckenstein, of Salt Lake City, won the match race. Johnny Albright failed to qualify in either heat, as he experienced engine trouble.

The remainder of the program was called off by the referee, as the track was in too dangerous a condition for riding. The summaries:

Three mile amateur race, 61.00 class open—First heat won by J. U. Constant; J. B. French, second; time, 2:25½. Second heat—Won by J. U. Constant; French, second; time, 2:22½.

Special match race between Larry Fleckenstein, of Salt Lake City, and Johnny Albright, of Denver—first heat won by Fleckenstein; time, 1:53½. Second heat won by Fleckenstein; time 2:12½.

Six mile professional race, 61.00 class, open—First heat won by Mercier; Costello, second; Lockner, third; time, 4:27½. Second heat won by Costello; Mercier, second; W. Wray, third; time, 4:20½.

HARLEM CLUB RUN.

GREENWOOD LAKE was the destination of the Harlem M. C. run on August 11, ten riders starting in spite of the threatening appearance of the weather. The route was over Fort Lee ferry, to Englewood, Hackensack, Paterson and New Foundland to the Lake, where lunch was served. About 4 p. m. the riders were caught in a rainstorm and took shelter, resuming the journey when the rain ceased here.

GOOD SPORT AT NEWARK

Plenty of Riders, Large Crowds and Keen Competition at the Jersey Motordrome.

NEWARK, N. J., August 17.—Riders are becoming so numerous that the Class "B" event has to be run in sections. George Hamilton, of West Orange, and Mike Costello, New York, coming at the last minute, made eight riders for Class "B." Costello, T. A. King, Albert Carlson and George Hamilton were put in section No. 1, and Earl Eckel, of Washington, Johnny King and Fred West were delegated to section No. 2.

Carlson (Indian) and Costello (Merkel) were matched for the Sweepstakes Elimination No. 5. Carlson made a runaway of it, gaining the half-lap on Costello before they had gone three-quarters of a mile, doing it in 37½ seconds.

The fast heat of the match race between Johnny King (Indian), of Newark, and F. A. King (Indian), of Denver, was started to-day, and was won by Johnny King. The summaries:

New Jersey Motorcycle Club race, 5 miles—Won by Henry Webber, Jr. (Indian), New Brunswick; second, Carl Segelbach (Indian), Newark. Time, 4 min. 22 sec.

First heat, Class "B," 2 miles, professional—Won by F. A. King (Indian), Denver; second, Mike Costello (Merkel), New York; third, Albert Carlson (Indian), Providence, R. I. Time, 1 min. 32 sec.

Second heat, 2 miles—Won by Johnny King (Indian), Newark; second, Earl E. Eckel (Indian), Washington; third, Fred West (Indian), San Francisco. Time, 1 min. 26½ sec.

Final heat, 6 miles—Won by Johnny King, Newark; Fred West, San Francisco, second; Frank King, Denver, third. Time, 4 min. 29 sec.

First heat, Class "A," 2 miles—Won by Eddie Hasha, Waco, Texas (Indian); second, Ray Peck, Los Angeles (Excelsior); third, Lawrence Flickenstein (Indian). Time, 1 min. 24½ sec.

Second heat, 2 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 1 min. 22½ sec.

Third heat, 3 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 2 min. 9½ sec.

Sweepstakes elimination heat No. 5, Australian pursuit style—Albert Carlson, Providence (Indian), vs. Mike Costello, New York (Merkel)—Won by Carlson. Distance, ¼-mile. Time, 37½ sec.

Special Match race, professional—Johnny King, Newark (Indian), vs. Frank King, Denver (Indian). Distance, 3 miles—Won by Johnny King. Time, 2 min. 14 sec.

Professional Invitation, 2 miles—Won by George Hamilton, West Orange (Indian); second, Albert Carlson, Providence (Indian); third, Mike Costello, New York (Merkel). Time, 1 min. 30½ sec.

Free-for-all, professional, 6 miles—Won by Eddie Hasha (Indian); second, Peck (Excelsior); third, Flickenstein (Indian); fourth, Frank King (Indian); fifth, Fred West (Indian). Time, 3 min. 58½ sec.

Sunday, August 18.—William Brown, of Newark, was an added starter in Class "B" to-day. He finished second in the final by riding high on the track and came within an ace of throwing Carlson, of Providence, over the fence two or three times by switching. Carlson, afraid to attempt to go by him, finished third, and immediately filed a protest to the referee.

The referee, however, explained to him that Brown was a new rider and should be given a chance. Brown got second money in spite of the protests. The riders all favored Carlson.

A five-mile professional running race was a new attraction. The best of runners in the East competed, including Billy Queal, the American ten-mile champion, who won in 26 min. 18 sec. The summaries:

N. J. Club race, 5 miles—Won by Carl Segelbach (Indian), Newark; second, Henry Webber, Jr. (Indian), New Brunswick. Time, 4 min. 13½ sec.

First heat, class "B," 3 miles—Won by Albert Carlson (Indian), Providence; second, Frank King (Indian), Denver; third, Wm. Brown (Indian), Newark. Time, 2 min. 15½ sec.

Second heat, 3 miles—Won by Johnny King (Indian), Newark; second, Fred West (Indian), San Francisco; third, Geo. Hamilton (Indian), West Orange. Time, 2 min. 15½ sec.

Final heat, 4 miles—Won by Johnny King (Indian), Newark; second, Wm. Brown (Indian), Newark; third, Albert Carlson (Indian), Providence. Time, 3 min. 01½ sec.

First heat, class "A," 2 miles—Won by Eddie Hasha, Waco, Texas (Indian); second, Ray Peck (Excelsior), Los Angeles; third, Lawrence Flickenstein (Indian), Denver. Time, 1 min. 25 sec.

Second heat, 2 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 1 min. 25½ sec.

Final heat, 3 miles—Won by Hasha; second, Peck; third, Flickenstein. Time, 1 min. 58½ sec.

Second heat, match race, 5 miles—Johnny King (Indian), Newark, vs. Frank King (Indian), Denver—Won by Johnny King. Time, 3 min. 48½ sec.

Professional, 5 miles, runners—Won by Billy Queal. Time, 26 min. 18 sec.

Motordrome Sweepstakes, elimination No. 6—Won by L. Flickenstein, Denver. Distance, 3¼ miles. Time, 2 min. 46½ sec.

Free-for-all, handicap, 6 miles—Won by Eddie Hasha, Waco, Tex. (Indian); second, Ray Peck, Los Angeles (Excelsior); third, Albert Carlson (Indian), Providence, R. I.; fourth, L. Flickenstein, Denver (Indian); fifth, Frank King (Indian), Denver.

DAN WILLIS.

Who was badly injured at Canton Saturday, the 10th inst. He will recover, it is said.

WILL BUILD SAUCER.

ST. LOUIS is to have a quarter-mile saucer ready for race meets before the end of August. The track is being constructed at Priester's Park, on South Grand avenue, and the banking will be steep so that speeds of 120 miles per hour can safely be attained. An unusually large seating accommodation is promised. With the Cleveland motordrome already in full swing, it is proposed to work this and the new St. Louis track in conjunction, riders being shifted from one to the other according to a schedule. The new enterprise is backed by Cleveland capital and is under the management of Charles P. Salen.

BOBZINE AND MILLER WIN.

MARSHALLTOWN, Ia., fans were treated to a combined automobile and motorcycle meet on Friday, August 9, but only two events were allotted for the single-trackers. These were a three-mile match between Bobzine and Kinzie, and a five-mile race, in which eight riders started. Bobzine won, his times being 4:06½, 4:26 and 4:22.12. In the second event B. Miller won, with I. E. Hubler second and Kinsey third. The time was 6:41½.

DECATUR RACE MEET.

AUGUST 25 is the date set for the next race meet at the Decatur (Ill.) track. The card will probably bring out Baker of Indianapolis, and "Shorty" Mathews and Stone, both on their Thors. Ten events are scheduled.

KLEBES AND VANDERBERY

Star on Point Breeze Motordrome—Veditz Winner of Unknown Distance Event.

FIRST lieutenant Robert Byrnes and officers of Troop G, First Squadron Cavalry, Pennsylvania National Guard, were the guests of the management of the Point Breeze Motordrome, Philadelphia, on August 15, when they witnessed some riding that bade fair to put their famous monkey drill in the shade. Klebes made a mile in 44 seconds, and also won the final heat of Class B, in which Klebes, Thomas, Vanderbery, Pancoast, and Veditz rode. The contestants kept close together, with the exception of Pancoast, until about five yards from the finish, when Klebes won out only by the length of a wheel. Second place was a tie between Thomas and Vanderbery. In the run-off Vanderbery won. There was some daring riding in the unknown distance race, five men starting and only four finishing. The riders were so bunched that it was extremely hard for the judges to decide the winner. In this event Klebes dropped out through engine trouble, Veditz winning. William Vanderbery was the star of the evening, winning two first and two second prizes. Summaries:

First heat of Class B, 4 miles, won by Klebes; second, Vanderbery; third, Veditz; time, 2:57½. Final heat won by Klebes, Vanderbery second, Thomas third. Four miles; time, 2:13 flat.

First heat of eight-mile open event, 4 miles, won by Vanderbery; second, Klebes; third, Veditz; fourth, Thomas; time, 2:55½. Final heat won by Vanderbery; second, Klebes; third, Veditz; fourth, Pancoast; time, 2:58½.

Match race, six miles, won by William Vanderbery. Time for first heat, 2:16 flat. Final heat, 2:16½.

Unknown distance open event (9 miles), won by Veditz; second, Vanderbery; third, Thomas; fourth, Pancoast; time, 6:47 flat.

PHILADELPHIA, August 13.—The races at the Point Breeze Motordrome, Philadelphia, were featured by two fires, both from broken gasoline pipes. After his machine had been pulled into a ditch and the fire extinguished, Vanderbery continued in the races, but Thomas was not so fortunate, his machine being put out of commission. For the second time in less than one week Harry Klebes, the butcher boy star, of this city, was the victor in every race in which he participated. Thomas, the Western rider, was disqualified in the open event for fouling Vanderbery near the finish of the four miles.

The best race of the evening was the eight-mile open, in which Klebes, Vanderbery and Thomas rode in sensational style, Klebes winning as in the other events. Summaries:

First heat of Class B, 4 miles—Won by Klebes, on an Indian; second, Vanderbery (Indian); third, Thomas (Indian). Time, 3:05 flat.

Final heat—Won by Klebes (Indian); second, Vanderbery (Indian); third, Thomas (Indian); fourth, Pancoast (Indian). Time, 2:15½.

First heat of open event, 4 miles—Won by Klebes (Indian); second, Vanderbery (Indian); third, Pancoast (Indian); Thomas disqualified. Time, 3:06.

Final heat, 4 miles—Won by Klebes (Indian); second, Vanderbery (Indian); third, Pancoast (Indian); fourth, Thomas. Time, 2:46½.

First heat of special match race between Klebes and Vanderbery, 3 miles—Won by Klebes. Time, 2:18½.

Final heat, 3 miles—Won by Klebes. Time, 2:13 flat.

KANSANS AT DENVER RACES

President Patterson, of the F. A. M., Witnesses One of Best Meets of Season.

DENVER, August 19.—One of the best programs of races ever witnessed on the Denver saucer was put on at the regular Sunday afternoon race meet at Tuileries. A large crowd saw the events, including Dr. Patterson, President of the F. A. M. Charles Fuller Gates officiated at the meet. They were here as leaders of the Kansas Short Grass Club Tour. A series of races between Kansas and Colorado riders was planned, but some of the visitors' machines were not in condition to race and Wells Bennett was the only Kansan who was able to participate. He won the first race for single cylinder machines.

The local riders made up in grand style for the inability of the Kansan racers to appear and staged three of the prettiest and hardest fought races ever witnessed in the West. Fredericks captured the honors of the day by winning two events, while L. E. Bowen won the title of the original hard luck rider. He finished second in the three big races and in two of them lost only by a fraction of an inch. In the second race he got off in front, but was overtaken by Fredericks, who won handily. Bowen led for four and two-thirds miles in the third event, when Swartz came up beside him, and in a neck and neck battle Swartz nosed him out.

Fredericks and Bowen rode so closely in the three miles match race that the crowd declared the contest a draw and insisted in loud voices upon having the race run over. The judges had difficulty in deciding the winner, but finally gave the race to Fredericks. The consolation event was quite as interesting as the balance of the program until after the second mile, when Cox forged to the front, winning over Richards by a wide margin.

Miss Inez Patterson, after being introduced to the crowd, was sought out by all the inquisitive fans and forced to re-tell the story of the hardships endured on the trip to Denver. The dames with the willow plumes and silk dresses were left in the shade, for little Inez in the khaki suit was the center of attraction.

Summaries: Two mile open professional, 30.50 class—Wells Bennett (Indian); Ted Hurlbut (Indian); R. Barclay (Excelsior). Time, 1:50¾.

Five mile open professional, 61 class—Curley Fredericks (Excelsior); L. Bowen (Merkel); E. Swartz (Excelsior). Time 3:34.

Five mile open professional, 61 class—E. Swartz (Excelsior); L. Bowen (Merkel); J. Cox (Merkel). Time, 3:44¾.

Three mile match race, professional, 61 class—Curly Fredericks (Excelsior); L. Bowen (Merkel). Time, 2:15.

Three mile consolation, professional, 61 class—J. Cox (Merkel); Bigenough Richards (Indian); H. Noll (Merkel). Time, 2:16¾.

TUILERIES PARK, Denver, Sunday. August 11.—Silvers Boyd successfully shook the jinx which has been following him for some time and succeeded in winning the twenty-five mile event from a field of five starters. He was off in the lead at the crack of the gun, successfully eluding any of his competitors who had ambitions of hanging on to his pace, and at the finish of the race

was the only contestant whose machine was in running order. After the second lap Richards was forced to quit with engine trouble, and Swartz followed at the end of the second mile. After Bowen and Fredericks had been battling for second place, with first one and then the other having the best of the argument, Bowen was suddenly thrown out of the running by lack of oil. After getting a new supply, he made two unsuccessful attempts to re-enter the race, but his machine refused to hit on two cylinders until after Boyd had crossed the tape. Fredericks had a miraculous escape in the first lap of the twenty-fifth mile when his rear tire blew up, but by shrewd manipulation he managed to maintain control of his machine and guided it to the running board, where he dismounted.

The match race between Bowen and Richards was fairly even until the last mile, when Bowen left his rival, winning by several yards.

The match between Fredericks and Swartz was of the hair-raising variety. Fredericks had less than a foot to the good at the finish. Summaries:

Twenty-five mile open, professional, Class B, 61—Silvers Boyd (Indian); Curley Fredericks (Excelsior); L. E. Bowen (Merkel); time, 19¾. Three-mile match race, professional, 61 class—L. E. Bowen (Merkel); Bigenough Richards (Indian); time 2:16¾. Three-mile match race, professional, 61 class—Curley Fredericks (Excelsior); Ed. Swartz (Indian); time, 2:14.

SALT LAKE CITY RACES.

SALT LAKE CITY, August 9.—Some of the best races of the season were run off last night at the Wandamere piepan. Ward showed some of the fastest riding seen this year. In his five-mile heat against Whittler he cut the track record 10 seconds, and in the eight-mile handicap broke it by 61-5 seconds.

Ward and Referee Rishel are now at it hammer and tongs. Rishel jumped Ward last night because he turned around at the start of the race to watch Whittler, who would not take the lead. From the looks of things there will be a change pretty soon, or a great clash. Saturday night of last week the "big referee" was not at the track, and one of his assistants took his place. Everything was run off smoothly and not a word of dissatisfaction was heard.

McNeil rode in great form. He took the three heats of the point race from Brodbeck and Bernstrom. Brodbeck rode hard but could not beat him. He rode well against Ward, after the latter had made up his lap handicap in the eight-mile event.

Ward had an easy time with Whittler in his match race. In the first heat, Whittler was beaten by about fifteen yards after Ward had led all the way. Whittler tried hard to steal away on Ward in the second heat, but the latter finally passed him and beat him by a quarter of a lap. Duckworth won his first race of the year in the two-mile professional after riding a hard race with McCall, who tried to go by Duckworth at the finish, but did not have the power.

The closing race of the evening was the most exciting. It was the eight-mile handicap. Whittler did not enter this race. Ward gave the other riders a lap handicap and had an easy time lapping them. After he had gained the lap, McNeil fell in behind him and

held that position until the finish. The summaries:

Point race, first heat, two miles—McNeil, Indian, first; Bernstrom, Indian, second; Brodbeck, Merkel, third. Time, 1:321-5. Second heat, three miles—McNeil, Indian, first; Brodbeck, Merkel, second; Bernstrom, Indian, third. Time, 2:17. Third heat, four miles—McNeil, Indian, first; Brodbeck, Merkel, second; Bernstrom, Indian, third. Time, 3:04. Final points—McNeil, 9; Brodbeck, 5; Bernstrom, 4.

Two-mile professional—Duckworth, Indian, first; McCall, Indian, second; Rognon, Indian, third. Time, 1:351-5.

Match race, first heat, four miles—Ward, Indian, first; Whittler, Merkel, second. Time, 2:521-5. Second heat, five miles—Ward, Indian, first; Whittler, Merkel, second. Time, 3:262-5.

Three-mile professional—McCall, Indian, first; Duckworth, Indian, second; Thomas, Indian, third. Time, 2:18.

Eight-mile handicap, factory riders—Ward, Indian, scratch, first; McNeil, Indian, one lap, second; Bernstrom, one lap, Indian, third; Brodbeck, Merkel, fourth, one lap. Time, 5:41.

OBJECT TO CLASSIFICATION.

FROM the Pacific Coast have come rumors of dissatisfaction over the new classification of riders into Amateurs and Professionals. Not only is this feeling reported current among riders, but dealers also dislike the classification and a bolt from the F. A. M. is said to be contemplated, along with the organization of a Pacific Coast body. The chief cause is said to be in the trade riders being classed as professionals, and a further and minor cause is the old time-worn one of "no benefits from the F. A. M."

To these dissatisfied ones, Secretary-Treasurer Gibson replies by quoting the new classification in detail, that a professional rider is "one who has competed for cash; or who, since the adoption of these rules, being connected either directly or indirectly with a person or firm that manufactures, assembles, sells or repairs motorcycles, motor-vehicles or internal-combustion engines, or operating them as a trade or profession, competes on tracks where the public is charged an admission; or who has otherwise failed to observe the rules applied to an Amateur." The Doctor says further: "I think you will agree with me that a man in the motorcycle trade is an Amateur as long as he does not compete on a track to which the public is charged admission." As regards the classification, this is on the lines of well-known associations such as the A. C. U. of Great Britain, and the A. A. U. of the United States.

Regarding the benefits, the new Touring Bureau which is to enable members to obtain maps of any part of the country they desire to tour in is being started, and the Doctor is working on a scheme to have members' machines insured against fire from any cause, and no matter where they are situated. These, in addition to the other benefits, not to mention the State organization and local control of F. A. M. work, seem to rebut the statements made in the "no benefit" cry. Dr. Gibson classes the feeling on the West Coast not as an outlaw movement but only a local dissatisfaction, which will soon subside with the knowledge of the real facts.

Every effort will be made to keep far-western members within the F. A. M. fold.

ON THE CLEVELAND SAUCER

Crowds as Large as Ever—Spills and Near-Spills Add Interest.

CLEVELAND, Tuesday, August 13.—Tonight a special race meet was put on by the management in honor of the International Typographical Union's Convention. A thrilling spill by Carslake, when his front tire let go in the final of the James Lynch Sweepstakes, took the breath of the spectators. Carslake's machine was wrecked, although he escaped without injury. Gibson was the big winner of the evening, taking the final in every event. Henikman trimmed Huntsberry in the amateur event. Summaries:

Four mile amateur for 7 h. stock.—Henikman, Indian, first; Huntsberry, Indian, second. Time, 3:21½.

Nine mile pro., three heats. Scored by points.—First heat, two miles: Seliga, first; Carslake, second; Gibson, third. Time, 1:32. Second heat, three miles: Gibson, first; Carslake, second; Standen, third. Time, 2:13. Third heat, four miles: Gibson, first; Knapp, second; Carslake, third. Time, 2:58.

Five mile pro., match race.—Seliga, first; Armstrong, second. Time, 3:55½.

Five mile, James Lynch Sweepstakes.—First heat, two miles: Smiley, first; Gibson, second; Carslake, third. Time, 1:30. Second heat, two miles: Seliga, first; Glenn, second; Standen, third. Time, 1:31. Final: Gibson, Indian, first; Smiley, Indian, second; Seliga, Indian, third. Time, 3:59.

Wednesday, August 14.—Tonight's races were witnessed by an overflowing crowd of 12,000 and they were thrilled when Charlie Glenn, of Toledo, narrowly escaped death in the eight mile professional race. He was forced to the steep incline over the dangerous "red strip" and on to the wire screen that separates the spectators from the speeding riders. On the last lap of the eight mile pro. race, Glenn, who was a length to the rear of Armstrong, attempted to pass his opponent. Armstrong swung into the Toledo boy and he shot to the top of the track, brushing the wire fence with his body and ripping his jersey off his back. As the machine hit the fence it rebounded half-way down the track alongside of Armstrong. Glenn kept cool and, righting his wobbling machine, dashed over the finishing line a few inches ahead of Armstrong, while the spectators that were massed in the stands stood up and cheered the plucky boy to the echo. It was Canton night at the Motordrome and marked the initial appearance of Holsinger, of Canton, and Witherspoon, of Cleveland, in a two-mile match race. Summaries:

Two mile amateur for 7 h. stock machines.—Huntsberry, Indian, first; Henikman, Indian, second. Time, 1:29¾.

Pro. team, free-for-all, teams to split purse. Placed by points; first heat, four miles.—Gibson, first; Carslake, second; Knapp, third. Time, 3:00. Second heat, four miles.—Gibson, first; Seliga, second; Knapp, third. Time, 3:00. Third heat, three miles.—Gibson, first; Knapp, second; Seliga, third. Time, 2:12¾.

Two mile match.—Witherspoon (Cleveland) and Holsinger (Canton)—Witherspoon, first; Holsinger, second. Time, 1:33¾.

Eight mile pro invitation.—Seliga, first; Glenn, second; Armstrong, third. Time, 6:19¾.

Five mile consolation.—Smiley, first; Hut-

tinger, second; Armstrong out. Time, 3:02½.

Saturday, August 17.—Tonight's races were featured a fifteen-mile pro. event, the final of which was interrupted by Jupiter Pluvius, although all other events were run off before the shower came, which put the damper on the meet. Summaries:

Three mile amateur, for 7 h. stocks.—Huntsberry, Indian, first; Henikman, Indian, second. Time, 2:32.

Six mile pro., three two-mile heats, scored by points.—First heat: Gibson, Indian, first; Seliga, Indian, second; Carslake, Indian, third. Time, 1:29. Second heat: Smiley, Indian, first; Seliga, second; Carslake, third. Time, 1:28. Third heat: Seliga, first; Carslake, second; Smiley, third. Time, 1:28¾.

Eight mile, invitation, pro.—Armstrong, Indian, first; Standen, Indian, second; Glenn, Indian, third. Time, 6:15½.

Fifteen mile free-for-all, pro., two five-mile qualifying heats and final of five miles.—First heat: Seliga, first; Smiley, second; Gibson, third. Time, 3:50¾. Second heat: Armstrong, first; Huttering, second; Standen, third. Time, 3:48¾. Rain closed the racing for tonight at this juncture.

Sunday, August 18.—Tonight's races were thrilling throughout, especially notable being the marathon race of 26 miles, which proved a runaway for "Wiley" Gibson, in which event, Knapp blew up a rear shoe and toured around the motordrome in an uncertain manner. Standen was next on the program with a tire to go flat, but neither he nor Knapp fell. Seliga, while running a close second, had to give up in the eighteenth mile due to engine trouble. Huttering stopped for oil once and again stopped for engine trouble, but finally managed to finish in third place. Armstrong quit in the twenty-second mile, while Standen dropped out in the twenty-fourth mile and went in again to get fourth money. Huntsberry made a run-away in the amateur event.

LORAIN CLUB'S MEET.

LORAIN, O., August 17.—A crowd of fully 1,000 decorated the grand stand and track today when Referee McConnell called the start of the race meet of the Lorain M. C. Five mile open, 30.50—Kissig (Indian), first; Schafer (Indian), second; Engler (Indian), third. Time, 6:32¾.

Three mile novice, stock 30.50—Engler, first; Erving (H.-D.), second; Michaels (Indian), third. Time, 4:20.

Five mile stock, 30.50—Kissig, first; Schafer, second; Robbins, third. Time, 6:55¾.

Open, miss-and-out—Kissig, first; Austin (Excelsior), second; Hoffell (Indian), third. Time, 3:21.

Ten mile open—Kissig, first; Austin, second; Schafer, third. Time, 12:06.

Ten mile stock—Kissig, first; Schafer, second; Engler, third. Time, 14:08.

One mile time trial—Kissig, in 1:14¾.

GROUND ECCENTRIC CYLINDER.

GRINDING is delicate work but to grind an eccentric cylinder is work that practically every factory will refuse. When Victor Loughed, a Chicago experimenter, sought for a company to do this form of grinding in Chicago he was unsuccessful until advised to go to the Harley-Davidson Motor Co. in Milwaukee. Loughed took the work to the Milwaukee plant, where it was done perfectly, and in a short time he was again on his way to Chicago.

WARD WHITTAKER'S MASTER

Former Defeats His Rival in Fast Ten Miles at Salt Lake City.

SALT LAKE CITY, Utah, August 16.—The fans at the Wandamere Motordrome now know that Al Ward is Whittler's master on the big pie-pan. Ward had to ride last night to beat the local boy, but he had the nerve and the machine, and nearly lapped Whittler before the ten miles had been covered. He lowered the track record by 30 seconds, making the distance in 6:56¾. Both of the riders were cheered when they came on the track, and many fans thought that Whittler would trim Ward with his new machine. Ward took the lead at the start and rode low on the track. Whittler did not want to take the lead, so rode high. While he was up there, Ward got such a lead that he could not catch him. He gained on him each lap and at the end of the ten miles was three-quarters of a lap ahead.

The seven mile handicap for the big fellows promised to be the best race of the evening until McNeil fell on the south turn of the track. Ward and Whittler were riding from scratch, and McNeil, Bernstrom and Brodbeck had two laps handicap. Ward started in the lead, but was passed by Whittler in the first lap. Bernstrom fell out of the race, as his machine was not working right, leaving just four riders to compete. Ward allowed Whittler to keep the lead for about a lap and the two stars started out to lap the other men. They gradually drew away from the handicap men. McNeil was riding fine, keeping below the pole line. He tried to oil and as he did so, his front wheel hit the running board and his machine shot back on the track, throwing him off. He was none the worse for his fall, with the exception of some slivers and cuts. Just after McNeil's fall, Ward had a little trouble with his machine and withdrew from the race, leaving Whittler and Brodbeck to fight it out. Whittler lapped Brodbeck once, but was unable to make the second lap in the seven miles.

McNeil easily defeated Brodbeck in the first heat of the professional race for five miles. Bernstrom crossed the tape first in the second heat against McCall and McNeil again won against Bernstrom in the final.

Rognon had everything his own way among the B Class riders. Thomas did some good riding last night and threatened to beat Rognon out, but the going was too fast for him. The summaries:

Five mile, Class A. First heat: McNeil, Indian, first; Brodbeck, Merkel, second. Time, 4:10. Second heat: Bernstrom, Indian, first; McCall, Indian, second. Time, 3:53. Final heat: McNeil, Indian, first; Bernstrom, Indian, second. Time, 3:58.

Three mile, Class B.—Rognon, Indian, first; Duckworth, Indian, second; Thomas, Indian, third. Time, 2:20.

Ten mile match race.—Ward, Indian, first; Whittler, Merkel, second. Time, 6:56¾.

Five mile, Class B.—Rognon, Indian, first; Thomas, Indian, second; Duckworth, Indian, third. Time, 3:59¾.

Seven mile Handicap.—Brodbeck, Merkel, one lap, first; Whittler, scratch, Merkel, second. Time, 4:46.

SECRET TIME RUN.

PHILADELPHIA, Pa.—The Harley-Davidson Club has planned a secret time run to Stone Harbor, N. J., on Labor Day.

AN important and very extensive new field for the utilization of the motorcycle and the motor-tricycle will be opened if the United States Post Office Department is successful in a series of significant experiments now being conducted in the city of Washington. The present introduction of the motorcycle in postal service is not, it need scarcely be explained, a wholly new departure. For several years past the power cycle has been in use to a constantly increasing extent in various branches of the service, and while its adoption has not been quite so extensive in this sphere as that of the regular four-wheel motor car its advance has nevertheless been rapid enough to prove gratifying alike to manufacturers and motorcycle enthusiasts.

However, unusual significance attaches to the present move on the part of the Post Office Department because heretofore the principal utilization of the motorcycle has been by postal employees as individuals. To give a clear idea of the situation it is necessary to point out that Uncle Sam leaves it to many of his postal employees to provide their own conveyances. Due allowance is made in one way or another for the investment represented by these conveyances and for their upkeep, but the Department leaves the selection of the mode of locomotion largely to the individual so long as the

required work is performed in a satisfactory manner.

R. F. D. Carriers Set the Pace.

This class of employees in the various branches of the service have, on their own initiative, been using motorcycles or motor-tricycles for some time past. Thus we find many motorcycles in use by Rural Free Delivery carriers, especially those having lengthy routes, and in this field the motorcycle has proven an especial boon, rendering excellent service on roads that would be well-nigh impassable for a regular motor car. Similarly the motorcycle is to some extent displacing the bicycle in the work

of the mounted messengers who distribute from city post offices and sub-stations the special delivery letters.

For a long time past, however, the administrative officials of the Post Office Department have felt that if there was one field above all others where the motorcycle might improve conditions it was in that of city collections. This branch of the postal business, be it added, is one which has become increasingly formidable of recent years. As American cities have grown in population, and as business has increased in the congested districts, the postal authorities have been at their wits' ends to devise satisfactory means of collection from the street

boxes and the mail depositories in hotels, office buildings, etc. It is not alone that there is a vastly increased volume of mail to be received from such sources, but there is a perpetual demand on the part of the public for more prompt handling of the mail.

Speed and Economy.

Under the conditions heretofore existing the collection of mail in the business districts of our cities has been accomplished by either footmen or by collectors in horse-drawn wagons. Both methods are somewhat slow, and the footmen are so limited in the amount of mail they can carry as to render the service inadequate and expensive. In the face of this dilemma it has seemed to the

officials that motorcycle collections would be ideal. Moreover, the smaller size of the motorcycles or motor-tricycles would render them preferable for such service to the larger motor cars such as are being employed to some extent for mail carrying in almost all our large cities. On top of the manifest advantages of the motorcycle for collection work in the business districts is the fact that it is at least the equal of the automobile for collections in the residence districts, whereas the lower cost of operation of the motorcycle is in its favor under all circumstances.

With such an incentive the Post Office Department officials began several years ago to make tests of motorcycles or motor-tricycles. Several firms have designed and constructed special models with a view to meeting the government needs. In physical characteristics, if it may be so expressed, these vehicles have been acceptable, and all the theoretical advantages claimed for the motorcycle in the postal sphere have been proven to exist in practice. The one fly in the ointment has been the difficulty in obtaining a product that would "stand up" under the tremendous exactions imposed upon it.

Must Withstand Hard Usage.

No person who has not investigated the subject can have any idea of the exceptional service required of a postal motorcycle or the hard usage to which it is subjected. In ordinary practice one of these machines is required to stop and start from 300 to 900 times in the course of a day's work, and must, in season, of course, be exposed to the most severe weather conditions. Then there is the further circumstance that the operation of such motorcycles must, perforce, be largely in the hands of inexperienced riders, or, at best, riders of comparatively limited experience.

Indeed, it is probable that there would now be in service in the postal establishments of our large cities hundreds of motorcycles or motor-tricycles for mail collection if any manufacturer could have evolved promptly a "foolproof" vehicle. Nothing less will answer. Under the exigencies of our postal system a given collection route is covered at different times by different men—mayhap in the case of sickness or emergency a "green" substitute, wholly unfamiliar with the work may be detailed. Thus it comes about that not infrequently a postal motorcycle will be entrusted to the tender mercies of an operative who knows no more about it than he has been able to master in a hurried lesson of instruction. Doubtless the time will come when every postal employee eligible for collection work will be thoroughly schooled in motorcycle operation and repair just as he is in any other line of duty, but in the meantime the motorcycle has had to bear all responsibilities.

New Tests Are Encouraging.

Within the past few weeks the problem has been brought nearer to solution than ever before. The postal officials have been conducting a new series of tests and experiments at the national capital, with a special type of machine, and the outlook is more hopeful than at any time in the past. Not only does the motorcycle itself represent improvements, but the officials in charge

have learned some things by their past experience. For instance, it has been the custom to keep mail-collecting motorcycles in practically continuous operation for 16 to 18 hours per day, allowing little or no time for overhauling or repairs. The officials have now come to the conclusion that infinitely better results might be expected if two ma-

cycle than with the ordinary machine, for it is no slight chore to push up a hill a vehicle loaded with 450 pounds of mail, the carrying capacity of the latest motor-tricycle submitted to the government for test.

After all, however, the most notable promise of the present experiments arises from the fact that the postal motor-tricycle

Testing the efficiency of motorcycle mail collections.

chines instead of one were provided in each instance, allowing for the overhauling of one machine while its alternate was on the road. It is felt, too, that a tremendous advance has been made with the introduction of a two-speed motorcycle. The advantage is far greater in the case of a mail motor-

cycle is being tried out in conjunction with a new type of street letter box, the latter comprising one of the most important inventions taken up by the Post Office Department in some time. Of course the introduction of this new type of letter box has no direct bearing on the motor-tricycle itself

(except that the vehicle must be specially built to operate in conjunction with it), but it does have a very important indirect influence in enabling motorcycle collection to quicken mail handling. Indeed, this new letter box may be said to be the one adjunct that has been lacking to bring about the millennium of motorcycle mail transfer, provided the manufacturers can perfect virtually unbreakable van outfits.

How the New Box Helps.

The new street letter box is of the drop-bottom variety, and the street box and the postal motor-tricycle are so adjusted in height that when the machine has been placed alongside the box and the bottom is dropped there is provided, in effect, a continuous chute through which the letters slide from the box to the metal body of the vehicle. The scheme will save time under all circumstances and the gain will be tremendous in the case of boxes, such as those in the business district, where there is almost always a heavy accumulation of mail, the removal of which by hand is a tedious operation.

As has been said, the body of the motor van outfit must be specially constructed to conform to the requirements of the operation of this new style box, but the design does not in any sense interfere with the employment of the vehicle for collections from street boxes of the ordinary type. A brand new feature of the latest postal motorcycle is a locked drawer at the top of the mail compartment. This is designed for safeguarding registered letters and parcels which may be collected by the postman on his rounds.

The saving that would ensue from the adoption of motorcycles for mail collection has not as yet been definitely worked out from the data obtained during the current experiments, but it is known that it will be tremendous. For instance, the average mail collection route for a horse and wagon (taking the average of cities throughout the country) is about 33 street boxes, and the average time for making collections on such a route is said to be close to two hours. Contrast this with a recent performance of the mail motorcycle now under test

which made collections from 97 boxes in a total elapsed period of 1 hour and 25 minutes. Conservative estimates indicate a mail-collecting motor-tricycle should do at least three times the work of the most efficient horse and wagon outfit.

Plan to Lease Motorcycles.

There has been some expectation in the trade that the Post Office Department, if it formally adopts the motorcycle for mail collections, will purchase the machines outright, but the present sentiment in the Department appears to be in favor of a leasing arrangement such as exists with reference to postal automobiles in certain cities where the motor cars have been introduced for conveying carriers to their routes, substation work, etc. Under this plan a local firm leases motor vehicles to the Department by the month or year at a fixed rental and assumes all responsibility for the maintenance of the vehicles in serviceable condition, the provision of new tires as needed, etc. At least one motorcycle manufacturer is now at work on a design that will still further specialize the machine with reference to postal requirements. For instance, the rider's seat will be placed farther forward than in the regulation models, thus rendering it possible for the postman to unlock a street letter box without dismounting.

TWO-DAY MEET.

AUGUST 24 and 25 are the dates set apart for the two-day meet of the Rockford (Ill.) M. C. meet at the mile dirt track in that city, Saturday's events will consist of a three-mile novice, a 10-mile pro., a 10-mile open trade, and a 50-mile club championship event. Sunday's program has three 10-mile events, a 5-mile trade open, a 15-mile pro., and a novice and five-mile stock pro., with a 15-mile free-for-all.

COULDN'T COMPETE WITH DEALERS IN TORONTO.

THE T. EATON COMPANY, LTD., the big departmental store of Toronto, has closed out its motorcycle business, for the reason that it found itself unable to follow up inquiries in the same manner as the exclusive motorcycle dealer.

READING from left to right in the photograph are W. J. Ruhle, Roy Bowser and Geo. F. Puls, all entered for the Manufacturers' Association six-day run, which was called off for "lack of interest." Their ire grew successively when the run was first cut down to three days, postponed and reached its climax when it was finally called off. They later consented to smile for the photographer, with the above result.

WINS PRELIMINARY RUN.

F. VILLEMUR won the preliminary run of the Escanaba (Mich.) Daily Mirror's road race between Escanaba and Hyde on August 12. The riders were started in three squads, the twins being despatched first. Villemur covered the fifteen miles in 18¼ minutes on his Indian twin, with Charles Brady, single Indian (second squad), second in 24 minutes flat. Fred Fournier, single Indian, and Max Liedtke, Harley twin, took third and fourth places, respectively, their times being 24:35 and 26:45.

PARADE, BARBECUE AND RACES.

THE Chicago M. C. has completed elaborate preparations for the race meet and barbecue to be held Sunday, August 25, at Riverview Park Motordrome. In addition to several amateur races there will be several events for professional riders. There will be a parade from the clubhouse at 9 a. m., and a barbecue at the Motordrome at noon. Races will be held in the afternoon.

TACOMA has added another "Indian" to its police squad, thus making the number of machines in use by the city five Indians and one Merkel.

WARD KEPT HIS WORD

By Winning in Straight Heats from Fred Whittler in Hard-Fought Match on Wandamere Bowl.

SALT LAKE CITY, Utah, August 3.—Al Ward's promise to defeat Fred Whittler in their initial meeting in a match race, was kept last night, when the little star at Wandamere won two straight heats. He not only trimmed Whittler, but smashed the track records for one mile and six miles. This feat was accomplished in the final event over the six-mile route. Ward completed the distance in 4:10½, which lowers his own time for the distance fourteen seconds. The timers declare that he rode the last mile in 39:4, which was over a second faster than any mile has ever been ridden on Wandamere motordrome.

In this event Ward and Whittler outclassed the rest of the contestants, and when the fifth mile had been ridden, they had lapped Bernstrom, Brodbeck and McNeil. Brodbeck and McNeil were fighting hard for third and fourth places. McNeil was ahead when Ward and Whittler finished, and slowed up, thinking the race was over, but on account of being lapped they had one more lap to go and Brodbeck won third place, after McNeil had lost his lead by shutting off at the tape. In the first heat of the match race, Ward took the lead and held it throughout, Whittler refusing to go in front. Whittler made several attempts to get by during the finish of the race, but the Indian rider always seemed to have something left.

In the second heat, Ward was compelled to go in front again and a great deal of jockeying was done. Ward almost stopped in an endeavor to get Whittler in front, but Whittler followed suit and stopped too. Then Ward went out with Whittler on. At the beginning of the fourth mile, Whittler passed Ward and cut him so close that he was compelled to use his cut-out. By so doing, Whittler gained quite a lead on him, but only held it about a lap, when Ward passed him. They rode side by side for the last mile, but Whittler was unable to get by.

McCall was first in the point race, finishing with nine points; Duckworth and Rognon tied for second place with four points. McCall easily outclassed the field in this event, winning all three heats. The five-mile three-cornered race ended in one of the finest finishes ever seen on Wandamere. After a hard fight, McNeil won, with Brodbeck second and Bernstrom third. They were so close at the tape that it was difficult to tell who won.

Two-mile point race; first heat—Won by McNeil (Indian); Rognon (Indian), second; Duckworth (Indian) third. Time, 1:31¾.

Second heat, three miles—McCall (Indian), first; Duckworth (Indian), second; Thomas (Indian), third. Time, 2:17.

Third heat, four miles—McCall (Indian), first; Rognon (Indian) second; Duckworth (Indian), third. Time, 3:10¾.

Final points—McCall, first, 9 points; Rognon and Duckworth, tied for second place, 4 points; Thomas, fourth, 1 point.

Four-mile match race; first heat—Won by Ward (Indian); second, Whittler (Merkel). Time, 2:52.

Second heat, five miles—Ward (Indian), first; Whittler (Merkel), second. Time, 3:40.

Five-mile, professional—McNeil (Indian), first; Brodbeck (Merkel), second; Bernstrom (Indian), third. Time, 3:44¾.

Six miles, open—Ward (Indian), first; Whittler (Merkel), second; Brodbeck (Merkel), third; McNeil (Indian), fourth. Time, 4:10¾.

W. W. Ours, of Clarksburg, W. Va., who holds the State track record.

BALTIMORE TRACK

Promoting Company Incorporated—A Three-Lap Saucer Will Be Constructed.

BALTIMORE, Md.—The movement started last winter to build a motordrome in this city has been revived by a new set of promoters. A company was formed last week, to be known as the Baltimore Motordrome & Amusement Company, with a capital stock of \$75,000, divided into \$25,000 preferred and \$50,000 common stock. The officers of the company are C. L. Clayton, president; F. W. Sandruck, vice-president; Irvin Sandruck, treasurer; George A. Rossetti, secretary; Louis McKim Kines, attorney.

The company plans to erect an amusement park accessible from all parts of the city. The bowl will be three laps and the flat part of the track will be wider than those now being constructed, so that running races may be held. The center of the plant will be converted into an athletic field. Tiers of seats will encircle the saucer, and capacity for 15,000 to 20,000 persons will be provided.

The selection of a site will be left to a committee, which will be appointed shortly. Six available sites are now under consideration. Tentative plans call for popular prices.

FOUR FINISHERS IN TACOMA CLUB ROAD RACE.

BECAUSE of the heavy roads caused by recent rains, but four motorcyclists finished with perfect scores in the race to Hoquiam, under the auspices of the Tacoma M. C.

Fourteen riders started from Tacoma at 6 o'clock on the morning of August 11, undaunted by the falling rain. Of this number but seven made the round trip.

Those who finished with perfect scores were Elmer Bergstrom and Edward Berreth, on Merkel machines, and J. E. Bunker and Edward Nelson, on Pierces. Ray Day and Ray Packard, on Merckels, and Arthur Whisner, on a Harley-Davidson, made the round trip in good time, but failed to get perfect scores.

The Hoquiam Motorcycle Club members met the endurance riders, treated them to a splendid luncheon and accompanied them part way on the return trip to the "City of Destiny," where the riders finished at 6:30 p. m. and enjoyed a well-earned rest.

THAT MISPLACED COMMA

It Was Detected in New Racing Rules at Columbus, But Thornley Settles All Doubt in Letter.

IN the letter printed below Chairman Thornley, of the F. A. M. Competition Committee, calls attention to a correction in the placing of a comma in the new Federation regulations governing the classification of competitors. The misplaced comma, as the chairman's letter explains, was detected and properly placed during the session at Columbus, but let the discussion over it appears to have raised a doubt in the minds of a few race followers, and the following communication is intended to make the situation perfectly clear. The chairman's letter follows:

"Owing to an error in punctuation which was corrected at the time the new classification of competitors was finally passed at Columbus, it would have appeared (had not the correction been made) that the new classification turned all riders professionals automatically who were connected with the trade. This is exactly what the new classification of competitors does not do. A man who is connected with the trade can retain and does retain his amateur status as long as he does not compete on tracks where the public is charged admission. The minute a man who is connected with the trade directly or indirectly; or in other words, a man who, under the old classification would have been listed as a trade rider, competes on a track where the public is charged admission, he automatically turns himself a professional. Men connected with the trade can compete in road events without losing their amateur status, and they can even compete on race tracks where the public is not charged admission. I mean by that, that if a couple of men connected with the trade happen to go to a local track and have a little "brush" where the public is not charged admission in any manner, shape or form, these men would not be turned professional. This classification is going to be rigidly enforced, but we do not propose to take advantage of technicalities. If there is any doubt as to whether the public is charged admission, either directly or indirectly, as at county fairs, the rider will not be given the benefit of the doubt, but in every case will be turned professional."

SPECIAL MATCH AT BRIGHTON.

RALPH DE PALMA, the well-known automobile racing driver, and David Bruce-Brown, also a king of the road, will meet in a match race at the Brighton Beach Motordrome on Thursday night, August 22. They will bestride two-wheelers, temporarily deserting the Mercedes and F. I. A. T. cars for their former flames. Before De Palma took to the automobile he rode in a number of motorcycle contests and the same can be said of Bruce-Brown. The match is looked forward to with great interest throughout automobile and motorcycle circles.

LORAIN RACES.

SEVEN races made up a program given at Lorain, Ohio, on Saturday, August 17, under the auspices of the Lorain Motorcycle Club. The meet was staged at the Lorain Driving Park.

ENGLISH NOTES

BY BRITISHER

Scottish Trials Put Participating Machines to a Most Severe Test, Particularly in Hill Work—Armstrong Three-Speed Hub Does Well—The James Two-Speed Machine.

I AM just back from a thousand miles jaunt accompanying the Scottish Trials, and have witnessed a run which ought to go down to history. It is the first trial I have ever been through in which the men have never felt nervous about the hills. Scottish hills never underdo the job. There are no rich residents to be taxed heavily for improvements, and the most eager surveyor has to confine his annual expenditure to a mere pittance, since in the Highlands he must draw his rates from a few crofters, farmers and fishermen, aided by small imposts laid on a few scattered mansions and summer hotels. As a consequence he can do no grading. Where an automobile road is needed, he takes the winding cart track which the farmer's horses have scarred over moor and fell and mountain, widens it a shade at the corners, and chucks a few cartloads of local stone rubble on the softer bits. Thus Scotch mountain roads are simply dirt tracks of precipitous gradient, with cairns of stones, piled on any parts which get soaked by drainage torrents in the rains; reefs of living rock jut up through the surface, and winter rolls down rubbish off the slopes. The promoters of this trial are less tainted with trade cautions and interests than any other committee; they are out to make a sporting trial, and they don't care if they get only twenty entries. But their event got such a reputation for sportiness, and won such advertisement for the one or two firms who have supported it in the past, that this year the British trade was compelled in self-defence to support it, and seventy starters were procured.

The Hills.—Well, these dashing organizers crowded into their 1,000-mile ride every bad hill that was within a hundred miles of a hotel big enough to house our caravan at nights, and in particular they put us up three hills which were always thought too bad for the automobile trials. If a hill is bad for an automobile, it is worse for a motorcycle, since the latter bucks about more on bad surfaces, and prefers a faster gait on grades. The week wore on, and by Friday night practically all the men had stormed up all the hills, and though some fifteen of the seventy had dropped out through accidents due to careless driving over such dangerous roads, thirty-two of the remaining fifty-five could still show clean sheets and perfect scores. This marked the promoters a trifle, and they took the somewhat objectionable course of revising the last day's trip, and inserting a hill always regarded as too severe to form part of any competition. It is the northern side of a very famous hill indeed, Amulree, and is variously known as

"Amulree's backstairs" or "Kenmore." It is three miles long, and starts off at right angles out of a narrowish road. Its difficulty is not so much the gradient as the turns, though about fifteen of its "steps" include longish patches of single figure gradient strewn with stones and crossed by rock-reefs. But the corners are nightmares. They number about a dozen; the track is excessively narrow, and two of the worst corners are incredibly acute, besides being heavily carpeted with loose stones, and jutting slabs. Rather to the disgust of the officials not a single man was balked by want of power. Several men fell at the bends, others hit the rock-slabs, bucked straight up into the air, switched off, and came down flop, but we all went up in quick time, and most of us non-stop, just putting out a leg to steady the machine as it began to rear or wobble after a frightful wrench on a bend. The triumphant ascendancy of the 1912 variable gears was complete. Of all gears the Armstrong three-speed hub was the chief victor, being used on a majority of the machines competing, but the similar Sturmey-Archer hub, and several makes of two-speed were almost equally successful. Amongst other achievements, excellent performances were recorded by two makes of lightweight, two cyclecars and two sidecars.

New Machines That Made Good.—A "cyclecar" is a three or four-wheeled vehicle on cycle lines, defined to sell at \$500 or less; they weigh less than 6cwt. and have an engine not exceeding 1,000cc. The pair entered are

known under the title of "G. W. K." and they have a friction disc drive. Many a fat fortune has been dropped in trying to apply this transmission to automobiles; however badly it may fail on large cars, it evidently just fits a cyclecar, for these two machines did what none of the official automobiles—modern vehicles of high horsepower—could perform, and averaged legal limit round the trip, climbing all hills. The lightweights to do well were the $2\frac{3}{4}$ h. p. Douglas two-speeder (already described in my pages) and the $2\frac{1}{2}$ A. J. S., a single cylinder of 300cc. with vertical engine, and chain drive, two-speed effected by two countershaft friction clutches, and duplicated sprockets. Of the side-cars one was a luxurious 6 h. p. Clyno, with air-cooled twin engine, and automobile type gearbox with ratios of $4\frac{1}{2}$, 8 and 14 to 1. The other side-car's success was amazing, for it was merely a $3\frac{1}{2}$ h. p. Triumph, with three-speed hub. No sane man would take such an outfit on such a job, but its driver got it through. It is true that he had a dampish time on the hills, for he ran alongside up most of them, and generally his passenger was soon overboard as well, while once or twice they did a lot of pushing; but they got up the hills somehow, and then they used to make up time. The fair passenger faded into the well of the side-car chair, and the driver made his "tummy" parallel the tank, and so, carving off all wind resistance, they opened up the throttle, and let the engine hum downhill and along the level into control. One good tire trouble would have spoiled their sheet, but, as luck would have it, they sustained no compulsory stoppages at all, except for plugs and belts.

How I Struck It.—I went round in a journalistic capacity, riding a $3\frac{1}{2}$ h. p. Triumph with three-speed hub. I have one of those silly hubs on which the top ratio is indirect—here's a warning to your hub makers. Supposing it was wet, and I decided that a 4-in. engine pulley was the smallest my belt could grip on; in that case my gear ratios would be somewhat as follows: 3, $4\frac{1}{2}$ and $6\frac{3}{4}$, of which the 3 ratio is obviously pretty useless except for a downhill blind. My plan was to carry two belts, one long, the other short. I used the long belt most of the way, thus getting the 3, $4\frac{1}{2}$ and $6\frac{3}{4}$ ratios. When we came to a very bad hill, I screwed down my adjustable engine pulley to give a direct drive of $6\frac{1}{2}$ to 1, and my ratios were then $4\frac{1}{2}$, $6\frac{1}{2}$ and $9\frac{1}{4}$, which allowed my hot engine to pick up on a 20 per cent. grade after being cut out for twenty yards at a fearsome corner. How I envied some of my fellow competitors, who had a different make of hub, with which the

Our English correspondent starting off for the Scottish Trials on a 3-speed English Triumph.

top ratio was settled by the pulley diameter; they could get ratios of $4\frac{1}{2}$, $6\frac{1}{2}$ and $9\frac{1}{4}$ with a four-inch pulley, whereas I dare not venture to put my ratios down unless the roads were dry. Let hub-gear makers appreciate the moral. A more interesting proof still of this point in design can be added. The man who got a side-car round with a three-speed Triumph had practiced over the course, using a hub on which the pulley ratio was the middle gear, and both low and top gears were indirect. He found he could not ascend the hills and at the last minute he substituted another make of hub, with its top gear direct, and both lower gears indirect, so using the very same gear ratios, but with a larger engine pulley. He now found he could climb hills on which he stuck with the former hub, proving that belt-slip with a small pulley is a greater evil than the friction implied by getting your bottom gear through two trains of pinions, as compared with one train. One side-car appeared with detachable and interchangeable wheels; the "knockout" spindle has been so cleverly applied that the two cycle wheels are interchangeable with the side-car wheel, and any wheel is removable in half a minute. He carried two spare wheels, shod with 3-in. tires, and lost no time at all with punctures. *Pour moi*, I used up two dollar tire repair kits, and was halfway through a third before Saturday came round.

Waterproof Magneto.—Here is a tip which may interest some of your boys. The new magnetos, alleged to be waterproofed, are not genuinely so, and four of us found it out in a real Highland drencher, when water got into our armatures through the paper washers used to joint the aluminum plates which close the ends of the horseshoe magnets. I had a rougher time still one day. My engine stopped as if it had been shot. I got down, and tested the spark—all O. K. Spent twenty minutes fiddling round with valves, carbureter, etc., and finally decided I must have made a bloomer, and re-tested the spark. No glimmer of one this time. Plug all right; cable all right; magneto contact-breaker all right; high tension brush all—hello!—where's its business end? Half the brush had disappeared into the intestines of the magneto, and the rain was coming down like a cloudburst. I was on the top of a desolate moor, 2,500 ft. above sea level, mist blotting out everything. Evidently I was getting intermittent shorts from the missing bit of brush. The last thing I wanted was to dismantle that magneto with so much wet around. I laid the machine flat on the sodden earth, and fished through the brush hole with a bit of wire; I played the post-office thief's trick, and angled for those bits with a piece of wire tipped with tire solution—no use. Finally I made a tent by laying my mackintosh across the carrier, squatted under its skirts, and took the mag to bits. But, alas, I failed to keep it dry, and when I had recovered the bits, there was still no spark. Finally I pushed a mile to a cabin, and dissected the mag once

more in a small horsebox full of turkeys and manure. This time I got her going, and we flew some till we caught up with the boys. But nowadays we carry shields over the waterproof magnetos, just the same as we did with the vulnerable type of 1911.

The James Two-Speed Side-Car Hauler.

The James' enclosed chain-driven two-speed model.

—I append cuts of a typical 4 h. British machine, heavily built throughout for the purpose of hauling a side-car. The engine dimensions are 86 mm. x 99 mm. and the drive is by enclosed chains throughout, the cases being split vertically, and instantly detachable by spring-snicks, though well-silenced from the chance of rattle by rubber pads. The gearbox is of the normal double dog clutch size, which is everlasting in wear, the first points to go being the keys holding the sprocket mountings, which require renewal after 5,000 miles or so. The boss on the near end of the countershaft contains a multiple disc free engine clutch, which is elastic enough to allow a total weight of 700 pounds to be re-started from rest on a grade of 10 per cent. (using the low gear, of course). The side-car connection lugs are brazed on to the frame of the motorcycle in correct positions, whenever so specified for passenger work, and the side-car can be attached or detached in a couple of minutes.

the next check without penalty is thereby eliminated.

2. Machines are scrutinized by independent amateur experts at the finish, and penalized for any defects, lost brakeshoes, bent foot-rests, poor compression, chafed wiring, and the like.

3. A single failure on a test hill disqualifies for a gold medal. Failure is strictly interpreted. A clean ascent must be free from legging to buck up a conking engine over a bad knuckle, from trailing the feet to steady-ing the balance on a hairpin bend, and from pedal assistance.

4. The spare parts carried are limited both in number and in character.

5. Two severe hills have to be climbed at less than twelve miles per hour on top gear.

Indian Victory.—The team of three 7 h. Indian machines ridden by G. E. Cuffe, Alan Hill, and J. R. Alexander, has been awarded the special prize for the best team perform-

ance in the Scottish 1,000 miles Trial. This reflects great credit on the Hendee factory, since fifteen teams were entered, representing the cream of the British industry, with the exception of the Triumph Company. Oddly enough, the Triumphs had the prize at their mercy if they had nominated a team, but they were unaware up to the start that three of their machines were entered. They sent no trade men, but three amateurs started on Triumphs, and all secured gold medals, whereas, owing to Cuffe's encountering a bad smash and continued tire troubles, he dropped sixty marks on the last two days. Alexander and Hill both recorded perfect scores. Against this patch of luck, due to the non-entry of the Triumph team, I must add that two of the Triumph men failed on all the worst test hills, whilst the Indians toyed with the fierce grades, and showed convincing mastery in picking up from a standstill after rounding acute V zigzag bends on terrific grades. Alan Hill was the only Indian brave who had a nasty passage. As he negotiated the double bend on the Devil's Elbow, the crux of the highest climb in the British Isles, he took a bumping football charge from two non-competitors who were rashly descending with inferior brakes; the smash left half his handlebar hanging by a thin skin of metal, and disorganized half his grip control. This is the only time that Alan Hill has blest his lameness, for having a game leg he always carries a walking stick strapped to his machine, and from this he jury-rigged a steering bar, and finished. On the very last check of the week his back cover blew to smithereens, and he had to take out his back wheel and fit a spare. The Scottish policemen of the Linlithgow district are still searching for him; the holiday crowds were out to welcome the regiments back from camp, and Alan roared through them with his cutout open and his hooter barking at sixty miles an hour, and just got in on time to win the team prize for the Indian crowd. His pace prevented the dazzled cops from reading his number. All's well that ends well.

Detachable Wheels for Motorcycles.—A by-road of design at present excites huge interest over here, viz., the perfection of detachable wheels for motorcycles. At first sight it may seem odd that a motorcycle should need a detachable wheel; 26 x 2½ in. covers are standard on this side, and after a little riding the beaded-edge type becomes as elastic as a kid glove, and can be whipped off by the fingers, while the modern solutions which dry as fast as gasoline and stick closer than a brother, have simplified puncture repairing until the clumsiest novice can put on a patch that won't peel or lift. To focus our opinions, we must remember what is the tire experience of an automobile owner on decent roads. His tires will run 3,000 miles without a single puncture, on an average. This because his car is not undertired. The average small motorcycle tire is extremely likely to puncture in the first 100 miles; a shard of broken glass may cut its brand-new cover in half; in 1,000 miles the corrugations will be worn down on the back wheel, and a canny rider will then swop his tires across; in 2,000 miles at the outside he wants a new cover for his back wheel, though the originals will run a lot further on the front wheel. Consequently he is often taking out his wheels, even if he has ordinary luck. Of course, if he strikes some putty inner tubes, or grinds out his driving tire rapidly because he does some

Detachable Wheel (Hub).

A A.—Central knockout spindle—main axle nuts not shown.

C.—Central hub carrying tire rim only.

E.—Dogs locking C to B and D, released by spring of forks when main axle nuts are removed from ends of A A.

B and D.—Side hubs, carrying sprockets, belt driven or belt drum.

F.—Fork ends.

G.—Nuts locking side hubs to fork ends.

fancy cornerwork or runs a sidecar in improper adjustment, the frequency of tire removals is enhanced. This because his machine is very plainly undertired.

The obvious remedy is to tire the machine properly by substituting either a heavier or a bigger cover. Some buyers make this a habit. I always order my roadster tourist machine without tires, and in lieu of the six-dollar cover supplied by the makers I fit a special heavy ten-dollar cover, from which I get 3,000 miles or more on the driving wheel. Why doesn't the English trade fit these costly covers as standard? For two reasons: First, because some of their competitors would undersell them by fitting the cheaper and lighter tire; and, secondly, because their customers are out for the lowest possible priced machine with a passable reputation. Consequently detachable wheels are the only way out on a commercial basis.

Until recently, the best solution was that adapted by the Rudge Company, whose back wheel came out quicker than anybody else's. You unhooked your belt fastener, ran a tube spanner on the two axle nuts, and hey, presto! the wheel dropped into your paw like a ripe cherry, for the only other obstruction was the belt rim brake shoe, and that worked outside the periphery of the rim. (The cones were specially cut a very tight fit on the spindle, so that they did not shift when you loosened the axle nuts.) Last year this solution looked like being a clue. This year it is as dead as a doornail, because epicyclic hubs are lumbering up our back wheels. In last year's Scottish Trials I three times fitted a new back cover in running time, and my watch showed the length of these three stoppages as eleven minutes, twelve and one-half minutes, and fourteen minutes, respectively. This year, praise the pigs—I never took my back wheel out; if I'd had to, it would have taken me *one and a half hours* to change a cover. Here's a list of the jobs: Put machine on stand; get out tools (five or six wrenches); unhook belt; unscrew brakeshoe; disconnect gear control; disconnect clutch control; loosen two chain stay axle hangers (similar to coaster brake lever arm); remove two hub control bell cranks from axle-ends; unscrew two axle nuts; remove grub screws and washers locking same; drop chain stay hangers; edge out spindle; take off old cover, plus security bolts to prevent cover from creeping under pull of engine on low gear at 3,000 revolutions a minute; fit new tire and tube; inflate; re-insert wheel, attach chain stay hangers; fit lock-nuts, with washers and grub-screws, adjusting each side till screws locked both dead tight; readjust bell cranks correctly to 1/32 in.; link up gear and clutch controls; adjust same to 1/50 in.; lower stand; restart engine. So the wheel removal problem has become once more acute; and especially so on

chain-driven machines, often having two band brakes and two chain wheels on the rear spindle. The method that seems likely to be adopted is a refinement of the knockout spindle. A 6 h. p. sidecar outfit competed in the Scottish Trials, on which the back and front wheels of the cycle and the side wheel of the car were all interchangeable. The driver carried two spare wheels lashed under and on the back of his chair, and with my own eyes I saw him change the back wheel and take the road again within five minutes, in spite of his having two band brakes and two sprockets on his rear spindle.

He uses springclip loose links in his chains, and snick-joints in his brake control rods. To each fork is rigidly bolted a small hub running on ball bearings. On the offside hub is attached a chain wheel or brake drum, and to the near side hub a chain wheel, brake drum, or belt rim, as the case may be. The tire rim is mounted on a third central hub, which lies between the two side hubs, and is held in position by a bolt which passes through all three hubs. This bolt does not support all the weight, but pulls the side hubs together, and affords frictional support between the faces of the hubs. The drive or braking strains are transmitted to the central hub by dogs cut in its faces, meshing with dogs cut in the corresponding faces of the side hubs. If the central bolt is tapped out, the forks spring a trifle, the dogs disengage, and the central or wheel-carrying hub drops out instantaneously. This type of hub is the coming thing for all machines with complex rear wheels, e. g., wheels carrying sprockets, brake drums, epicyclic hubs and the like. The old fixed type of hub is cheaper to manufacture, and will be retained on all machines using the two-step drive, for the removal of their back wheels is similar to that of the Rudge described above, viz.: unscrew axle nuts and unhook belt or chain, the sole rear brake working on the outside of the belt rim shoe. I should add that band brakes are defunct over here; our chain-driven machines mostly carry a dummy belt rim, embodied solely for braking purposes. This triple hub is immense for passenger outfits, as the one spare wheel can be used to replace any of the three or four contained in the chassis.

Surveyed Grades in Big Endurance Run.

—The worst grades in the English 1,000 Miles are as follows: 1. Beggars Roost, 200 yards of 1 in 3½ (guaranteed survey); this is actually the only road to a small hamlet. The urban authority is ready to construct a side road, properly graded, but the owner of the land will not sell, unless road authority simultaneously constructs a second road on another slope for his private convenience. 2. Lynmouth, 300 yards of 1 in 4½ (guaranteed survey); very rough declivity, including a fearful corner.

The Clyno 5-6 H. P. two-speed.

Clyno Two-Speed Gear.

The Clyno Transmission.

The Most Popular British Sidecar Hauler.

—The Clyno cuts herewith show the machine which shares with the 7 h. p. Indian the chief favor of British riders as the power provider for sidecar outfits. Fig. 1 shows a near-side view of the complete machine—notice the totally enclosed chains—the aluminum shields pull off without tools; also the “kickstarter” on the countershaft, and the telescopic two leg stand, enabling the machine to be firmly propped on a sloping surface. Fig. 2 shows the countershaft complete, removed from the machine, with square brackets for locking in frame, pinion for kickstarter, sprockets for chains, rocking pedal for gear control, and case covering the two friction clutches of the two-speed gear. Fig. 3 shows the plant of the transmission.

RUN DOWN BY TRUCK.

A. W. DEVINE, of Roxbury, Mass., was run down by a motor truck in Boston just as he was about to start on the North-eastern Tour to Columbus on his Excelsior. His machine was wrecked but the rider managed to escape serious injury, although he was thrown nearly 25 feet. Devine states that he has a clear case against the truck driver and that he will take immediate action to recover damages. Being unable to obtain another machine on such short notice the rider was obliged to forego his trip to the convention city.

INJUNCTION DENIED.

VICE-CHANCELLOR STEVENS recently filed an opinion denying a preliminary injunction against the operation of the new motordrome in the Vailsburg section of Newark, N. J., asked for by residents of that neighborhood. The Vice-Chancellor based his denial of the temporary restraint asked for on a finding by the New Jersey Court of Errors and Appeals, but for which, he says, he should have thought that the prior decisions of that tribunal would have warranted a temporary injunction.

MAY LEASE BUILDING.

MEMBERS of the Lima (O.) M. C. have authorized their secretary to make an offer for the lease of the whole of the Pabst building on West High street, the club now occupying the second floor. The first floor is vacant and if the offer is accepted the Lima club will be exceedingly well equipped.

AT MIAMI WORKS.

A FEW of the recent visitors to the plant of the Miami Cycle and Manufacturing Co.: Beginning at the top row, reading from left to right: Arthur Davidson and Will Davidson of the Harley-Davidson Motor Co., Milwaukee; Secretary James W. Ash, of the Miami Cycle & Manufacturing Co.; Wm. F. Harley, of the Harley-Davidson Motor Co.; W. K. Aurandt, straw hat, Eastern salesman for the Merkel; Kelly R. Jacoby, president and general manager of the Miami Cycle & Manufacturing Co. Seated, with felt hat, S. W. Lippow, of the Milwaukee Cycle Supply & Sales Co., Milwaukee; light cap, Harry Mapp, of New York City. Third row, motorcycle cap, with goggles, C. E. Waltz, a civil engineer of Detroit who rides a Flying Merkel; Joseph P. Schantin, of Portland, Ore., who is touring from Portland, Ore., to Portland, Me.; F. W. Buchanan, Flying Merkel agent at Johnstown, Pa. Next row, A. P. Dick, Flying Merkel rider in Philadelphia; “Mac” Sheets, Central Western Coaster Brake Missionary; Charles Teasdale, of Elmira, N. Y. Bottom row, John G. Ledyard, Merkel agent

at Camden, N. J.; Stanley H. Smith, Carbon-dale, Pa., and James H. Mayo, Merkel agent at Reading, Pa.

AN R. F. D. CONVERT.

ELMER WARRINGTON, rural mail carrier out of Keota, Ia., intends to give the patrons on his route better service and save himself considerable time each day by delivering his mail on a motorcycle.

LONG DISTANCE TOURS.

RICHARD WARD and William Ward, Jr., of Camden, N. J., are touring New England on their motorcycles.

THE Allen M. C., of Allentown, Pa., held a special run to Lake Hopatcong, N. J., on July 28. The route was through Bethlehem, Nazareth, Easton, Washington and Hackettstown.

MOTORCYCLES are being used by officials at the Fort Collins, Colo., U. S. Experiment Station in conducting investigations throughout the State.

RETURNED THE MONEY.

TWELVE years ago this month, C. Brierly, of Detroit, was taken off a freight train at St. Thomas, Ontario, and was given 45 cents with which to buy a ticket back to London, Ont. A few days ago, Brierly, using a motorcycle as a means of transportation, stopped at the City Hall at St. Thomas and, seeking the city treasurer, paid him back the 45 cents.

GOOD TOWING TIP.

IN towing a motorcycle, a good plan is for the rider of the towed machine to wrap the rope once around the bar near the center, holding the other end in the hand. In case of a fall, the rope will come off and the rider will be saved from being dragged, or spilling the other man.

MOTORCYCLES FOR RANGERS.

FOREST RANGERS in Porterville, Cal., are hereafter to patrol their ranges on motorcycles instead of ponies. With the motorcycle the ranger will be enabled to cover between 150 and 200 miles a day, while 50 miles daily was the best average on the pony.

RESTRICTED TO GUARDSMEN.

IT is announced that the meet to be held at Syracuse by the National Guard and Naval Militia on September 14 will be restricted to riders who are members of such organizations, and that events will not be open to all competitors.

“DISGUSTING AND DANGEROUS.”

ROCKFORD, Ill.—Declaring the practice to be both “disgusting and dangerous,” Chief of Police Bargren will ask the city council to pass an ordinance prohibiting girls from tank-riding.

FOR ELECTION WORK.

ASSISTANT CHIEF OF POLICE FLETCHER, of Coffeyville, Kans., and his motorcycle were pressed into service to take the instructions to the board of Cherokee township. The election was held at the Winters school house. Mr. Fletcher made the trip out there in 25 minutes and returned in 15 minutes.

ONE of the objects of the newly-organized motorcycle club at Scranton, Pa., is to assist in the good roads movement.

DEKALB, ILL., has the first motorcycle “cop,” Officer Sid Rowe.

J. C. Reiter, a popular officer of the Dayton (O.) force, with his Merkel, ready to catch speeders.

International

Donald McKie

Tour

Part II

Through Virginia, Pennsylvania and New Jersey to New York

IT is astonishing the number of creeks the State of Virginia leaves unbridged, and in rainy weather they are certainly a great inconvenience to the people living around there as well as to the tourists. After several hours of the most uncomfortable riding, walking and running, we were glad to get out of Franklin County. We took the wrong road and found ourselves riding around the top of a mountain over bad roads and went through many hardships before getting back on the right route. If all motorcyclists will take our tip they will always go back to the right road as shown on their map, instead of winding through unknown forests trying to follow directions given by uneducated farmers, many of whom delight in sending motorcyclists on the wrong road.

Finally we got to Roanoke, Va. At the Roanoke Cycle Company headquarters, we met Mr. Webb, who showed us every courtesy. We rode on toward Natural Bridge, where we intended to stay a couple of hours. The time spent at this place will never be regretted. A charge of one dollar is made for sight seeing and it is well worth the price. The main road passes right over the natural bridge, but it is so wide that one cannot tell this when on the road. By railroad this place is almost inaccessible and any motorcyclist passing near should take advantage of the opportunity to visit this famous spot. The roads from Natural Bridge into Lexington were exceptionally good. We did not attempt to go any farther than Lexington as it was about dark when we reached that place. Accurate account of the creeks we forded between Roanoke and Lexington showed that there were nineteen of them, some large, some small, but a grand total of nineteen. Our mileage for the day was 97.6.

Pennsylvania Toll System.

Thursday morning we got started with the earliest cocks, having only 31 miles to ride before we struck the Staunton Pike. This was covered in short order and we had breakfast in Staunton. Just before entering the city we paid our first toll, five cents, and after that every five miles we had to stop and pay ten cents. No extra charge was made for the rider on the tandem. Think of paying two cents per mile for riding over roads on a motorcycle! The reason is that they are "corporation owned." There are 90 miles of this pike, extending right into Winchester, Va., up the Shenandoah Valley, with mountains in the distance on either side. From Lacey Springs a 20-mile detour in the mountains will bring one to the famous Caverns of Luray Cave, which in natural wonder are pushing Mammoth Cave in Kentucky for first place.

A slight shower fell about half way up the Staunton Pike, but this did not stop us, especially as it was soon over. We had been riding with throttles well open on the good road, and we needed gasoline at Winchester. We also purchased Indian oil from the agents, as our supply of two gallon cans was now exhausted. The National Highway from here leads via Charleston, W. Va., but the macadam toll roads going via Martinsburg, W. Va., right into Hagerstown, Md., will be found far better. We reached the latter place just about dusk and decided to spend the night there. Mileage for day, 171.4. It is worth while to mention that we paid out approximately two dollars each in tolls. At Shepherdstown, 15 miles out of Hagerstown, we crossed the Potomac river on a toll bridge. There a charge of five cents was made for each passenger.

Friday morning we left Hagerstown about 6 o'clock, finding the weather rather cool. We soon entered the State of Pennsylvania and passed Leitersberg, Waynesboro and Rouserville in the order named. Out of the last named we climbed a man's size mountain, but the road surface was excellent, barring the water breakers. Because of carrying an extra rider I had to ride rather fast and every time we hit one of the water breakers the machine would go into the air several feet. Soon we reached the National Park at Gettysburg. From Gettysburg the next town of any consequence is York, where we got gasoline and oil. Twelve miles further on we crossed the Susquehanna river on the Pennsylvania, R. R. bridge, at a cost of nine cents each. Two of us had been over the roads once previously and we noticed that we were paying toll on roads this time where we were allowed to go through free on the previous trip.

Over Good Jersey Roads.

For seven miles into Coatesville, Pa., the roads are the worst imaginable, with loose rocks making riding along there most disagreeable. Passing Coatesville, the roads improve and 25 miles out of Philadelphia they are very good. Here tolls begin again, though they are not quite as high as some of the previous ones. A couple of punctures delayed us somewhat and we were fifteen miles out of Philadelphia at dark. With lamps lighted we found it easy to ride into Philadelphia, and after hunting about an hour for a hotel that would take people in with our costumes, we approached a

motorcycle officer and he directed us to the Y. M. C. A., where we procured comfortable quarters.

We got away from Philadelphia about 1 o'clock Saturday afternoon and without the aid of a guide we had some difficulty in finding our way out. The roads to Trenton were very bad, with deep ruts where heavy automobiles had been running. After getting to Trenton, N. J., we had nothing but good roads, but the New Jersey roads have too wide a reputation for their superiority to require comment here. At Perth Amboy we took the ferry for Tottenville, Staten Island, and the seventeen miles of good road across the Island were soon covered. Then the St. George ferry carried us to the Battery. Fortunately we found practically no traffic on Broadway as late as 6 o'clock Saturday afternoon and made our way to the store of Bidwell & Conklin, where we stored our machines. The mileage for the day was 98.6.

On Sunday we took a short ride around New York, but did not leave until 4 o'clock Monday. We had as a guide up to Bridgeport, Frank Hart, the amateur champion. He was testing one of the Milford side-cars for the Hendee Mfg. Company and took Hudson, who had been riding on my tandem, in the side-car. Hudson is now very enthusiastic about the easy riding qualities of the basket. We spent Monday night at Bridgeport and will long remember the kindness of Stanley Kellogg, the Eastern distributor for the Excelsior. At night Mr. Kellogg took us for a spin in his well-tuned runabout, and otherwise treated us royally. Mileage for the day, 66.2.

About midday on Tuesday we started for Springfield, Frank Hart showing us the way out of the city. The roads were very good and we were sorry when we rode into Springfield, after covering 88.4 miles. We had passed through New Haven and Hartford, Conn., but did not stop at either place.

After it was all over, the trip from Atlanta seemed very simple indeed, but appeared quite different at times while we were actually performing it. It was plainly demonstrated that with good machines, a little nerve and sufficient stamina the trip can be made with a rider on a tandem attachment, which is certainly enjoyable because of the sociability feature. A little discussion of a certain point of interest surely impresses it on the mind more than mere observation. This point alone makes tandem trips worth while.

We had ridden 1,169 miles in a manner much more economical than it could have been done otherwise. It is rather difficult to keep accurate records going through the country and under the varying conditions,

but as nearly as we can figure we consumed only 17½ gallons of gasoline, making our average 66 miles per gallon. No record was kept of the oil consumption. The above refers to the machine with the tandem. No record of the others was kept, but it was not very much less.

The price of gasoline all the way to New York was 20 cents, with the exception of a few places where we paid from 15 to 18 cents. At Philadelphia it was selling at 10 and 12. On reaching New York we were greatly surprised to find it selling at 18 to 25 cents per gallon and at once attributed these exorbitant prices to some combination on the part of the various sellers. We had expected it would be as cheap in New York as it was in Philadelphia.

Coolidge, on the Indian, had two punctures, but there were none for the Thor. I had three. However, we regarded this small amount of tire trouble as entirely satisfactory. We left our machines in Springfield, much to our regret, and took the trolley for Boston. As far as we could see the roads from trolley they were excellent and many times did we regret not going on to Boston on our motorcycles. We then went to New York, attended to the shipping of our machines and other matters. They should always be handled by some forwarding agent and all instructions necessary will be cheerfully given when arrangements are being made.

We sailed on S. S. *Oscar II* on June 20 for Copenhagen, and this instalment of our story was prepared aboard ship on the way over. We are not pressed for time and it is our intention to see all that is worth seeing along our route before we again turn toward America. As we progress we will tell the readers of *MOTORCYCLE ILLUSTRATED* of our most interesting experiences and give all the practical information possible so that American motorcyclists may be given a broader insight into European touring conditions.

A UNIQUE FIRE.

A TRIUMPH motorcycle belonging to Bert Bastedo, of Toronto, was destroyed by fire recently, thanks to the tampering of some unknown person who disappeared completely after the incident. Bastedo had left his machine in the basement of the building in which he is employed, and as a safeguard, had disconnected the magneto wire from the spark plug. In his absence, the curious party had tickled the carburetor until it flooded, after which he attempted to start the machine in the usual way. The dangling magnetic wire sparked against the engine cylinder, igniting the leaking gasoline, with the result that the machine was burned up. The blaze was so bad that the fire department was called to extinguish it.

VIENNA POLICE NOTICE.

HOLDING that pedestrians are generally to blame for street accidents, the Vienna (Austria) police have issued a notice that a pedestrian crossing the street must do so in a direct line, taking the shortest path. Those caught walking down the street lengthwise and thus endangering their own safety will be first reprimanded and then fined, the sums inflicted varying from 38 cents to \$40, according to the nature of the offense.

ARMY EXPERIMENTS.

COLUMBUS, Ohio.—The General Service corps of the Ohio National Guard, stationed at Columbus, has started to experiment with motorcycles as a means of carrying messages while the guard is on field duty. The experiment was tried Sunday, August 4, when three riders, Corporal Kissinger, and Privates Pegg and Osgood, started from Columbus carrying a full line of equipment and accoutrements, including a shelter tent, for the camp in Richland county, a distance of 100 miles. The riders gathered data and will report to Major Jaquith, head of the signal service department of the Ohio National Guard, and Adjutant General Weybrecht.

DEMAND FOR NON-SKIDS.

THE demand among motorists for pneumatic tires with non-skid treads is greater at the present time than ever before in the history of the tire-making industry. Perhaps one reason for this is that manufacturers, during the past two years, have developed the non-skid style of tread with marked success. There is, however, a broader explanation for the present popularity of this type of tire. It pertains to other advantages besides protection against skidding.

Outlining these advantages and commenting on the popularity of non-skid tires, an official of the United States Tire Company says:

"The best evidence we have of the wide demand for non-skid tires is the fact that both our Nobby Tread and Chain Tread types are always sold up far in advance of our production.

"There are several reasons why motorists prefer the non-skid style of tire. In the first place there is the ever present protection against skidding. Furthermore, where the tread is raised, the user gets a much thicker and heavier wearing surface. This has the effect of increasing the mileage rendered by the tire. The manufacturer is enabled to place much more rubber between the tire carcass and the exposed surface of the tread than can be successfully utilized in the ordinary smooth type of casing.

"With ordinary usage a motorist should get hundreds of miles of service out of a non-skid tread before the tire wears down to the regular tread surface.

"Another advantage which motorists claim for heavy non-skid treads is that they reduce the number of punctures, throwing off sharp objects entirely or picking them up in such a way that they do not penetrate the casing or puncture the tube."

DETROIT DEALERS' RACE MEET.

DETROIT, Mich.—Despite the fact that no trade riders were present to lend that quality known as "class" to the proceedings, the motorcycle meet staged at the State Fair Grounds Sunday under the auspices of the Motorcycle Dealers' Association was successful.

M'Lean was the bright particular luminary of the meet, winning the unknown distance event, five-miles for fully equipped stock machines, and taking second from scratch in the twenty-five-mile handicap event. Darrell, with two firsts, was his closest rival for the day's honors. The summaries:

Ten-mile novice—Crissman, first; Darnell, second; Egan, third; time, 12½. Ten-mile handicap, 30.50 machines—Darnell (4 min.), first; Crissman (scratch) second; Egan (4 min.), third; time, 11:04½. Unknown distance event, 11 miles—M'Lean, first; Dougherty, second; Platte, third; time, 11:28½. Five-mile, fully equipped stock machines—M'Lean, first; M'Caffrey, second; Platts, third; time, 5:21½. Twenty-five mile handicap—Darnell (5 min.), first; M'Lean (scratch), second; Platts (3½ min.), third; time, 26:24½.

The twenty-five-mile handicap was the feature event of the afternoon. M'Lean passed Darrell two times and was rapidly overhauling him when the final tape was reached.

VISITED H. D. WORKS.

G. M. RICKETTS and Earl Miller, of Lancaster, Ohio, have completed a round trip between that city and Milwaukee, which they took to visit the Harley-Davidson factory. The trip was made practically in the rain, which fell in quantities every day they were on the road. In spite of the poor conditions of road surface encountered, they both had a successful ride, but Ricketts made the return trip from Springfield on by rail, owing to breaking his forks by falling into a chuck-hole. Miller made the 1,200 miles without trouble of any nature. Their best day's run was 300 miles, and the 110 miles from Indianapolis to Dayton was negotiated in 3 hours and 15 minutes. Both riders used Harley-Davidson machines.

SUCCESSFUL SEASON.

F. P. GRAVATT, of Atlantic City, N. J., reports that he has had an excellent season, having already disposed of thirty-five Flanders machines. Atlantic and adjoining counties are good Flanders users, and the remainder of New Jersey is reported most appreciative of the Pontiac product.

Motorcycle Police Squad in Oklahoma City, Okla.

A WEEK BY THE SEASHORE NEXT YEAR

Atlantic City Chosen For 1913 Convention of the Cycle Trades Associations—May Go to the Pacific Coast in 1915—Features of the Detroit Meeting

1913—ATLANTIC CITY.
1914—?
1915—THE PACIFIC COAST.

BEFORE leaving Detroit, the Parts Manufacturers voted unanimously in favor of holding the 1913 convention of the Cycle Trades in Atlantic City. Subsequently, at the joint meeting, Charles A. Persons suggested that the program-makers arrange for a whole week's entertainment, from Monday morning to Saturday evening. The proposal met with instant favor and Dave Smith, chairman of next year's general committee, promised to give it thoughtful consideration.

Although, of course, no official announcement has been made regarding the 1915 session, the fact that San Francisco will then hold a World's Fair has been responsible for no small measure of sentiment in favor of a trans-continental journey by special trains to the Golden Gate City, Los Angeles, and points of interest in Oregon and Washington. In fact, many of the visitors to the Detroit convention spoke with an assurance which could not have been firmer had the matter already been settled. The plan is one of such tremendous possibilities that the average prospective participant dares only to dream of it just now, although its realization in fact is considered by no means improbable.

The sixth annual convention of the Cycle Trade Industries passed into history a little less than a fortnight ago. Saturday evening, the 10th instant, saw the Cadillac, Detroit's favorite motoring hostelry, practically deserted. At least it appeared so to one of the left-overs, for without the two hundred and seventy-five cycle and motorcycle tradesmen, their wives and friends who had enlivened historic Detroit during four joyous days, the Cadillac and its environs seemed quiet indeed.

The convention was a notable one in the matter of attendance and the interest which attached to its program, the features of which, briefly summarized, were as follows:

Tuesday, August 6.—The sail on Lake St. Clair aboard the Steamer *Sappho*. Although many were then on their way to the convention town, more than one hundred took advantage of this opportunity to become acquainted with newcomers and to renew associations of former years. It was an excellent idea to open the festivities with a sail, bringing the entire crowd, under most informal circumstances, within the small compass of two boat decks. Similar arrangements should, if possible, be made for the Atlantic City gathering next year.

Tuesday evening.—Theatre party at the Temple.

Wednesday, the 7th.—Morning and afternoon sessions of the Motorcycle Manufacturers' Association. The re-election of President Coffman and other former officials, with the exception of Secretary Cox, whose resignation from the Pope Manufacturing Company made it necessary to select a new man. L. D. Harden, who succeeded to Mr. Cox's place in the Hartford company, was also elected to

Mr. Cox's former position in the M. M. A. That organization went on record as favoring a motorcycle exhibit at the Panama Exposition, and as endorsing the trans-continental relay race recently voted for by the F. A. M. A. committee was appointed to arrange for Chicago Show space, and it is not improbable that an independent motorcycle exhibit will be held, although there is no disposition to deliberately throw over the auto show crowd, provided only that the latter discloses the slightest inclination to deal fairly with the M. M. A. This prospect is hardly bright enough just now to call for any great enthusiasm.

Wednesday afternoon.—Informal reception for the ladies, of whom there were more present than ever before. Mrs. Surre, Mrs. Willis and Mrs. Fry received. Euchre was the order of the afternoon, prizes being awarded to the high scorers, and favors to all.

Thursday evening.—Annual bowling match on the Pontchartrain alleys. The parts and accessory makes won the team honors and W. B. Colburn, of the Pierce Cycle Company, first individual prize with a score of 181. Mrs. Keyser Fry, of Reading, with 84, carried off the distinction of being the most proficient of the feminine artists.

Thursday, August 8.—The Cycle Parts and Accessories Association voted in favor of holding next year's convention in Atlantic City, naming Dave Smith chairman of the general arrangements committee.

The jobbers reorganized with a large charter membership. F. I. Willis, of Indianapolis, secretary of the old organization, was chosen president of the new one.

Thursday afternoon was devoted to visits to the automobile-manufacturing plants of the Ford and Packard companies. Shortly before nine o'clock that evening, the steamer *Pleasure* left the foot of Woodward street for what was scheduled to be a moonlight sail. Luna was hidden somewhere behind a bank of clouds, but the perversity of the moon was of absolutely no consequence. Practically the entire crowd was aboard, and if anyone failed to enjoy himself, he had no occasion for blaming the party, which was jollity personified. This

event was easily the most pleasureable on the program.

Friday, August 9.—In the morning, a joint session of the cycle trades, Ralph D. Webster, of the Eclipse Machine Company, presiding. Addresses were made by F. I. Willis, Hearsey-Willis Company; A. B. Coffman, Consolidated Manufacturing Company; John W. Henry, Vim Cycle & Hardware Company, and J. Leo Sauer, publisher of *MOTORCYCLE ILLUSTRATED*.

Friday afternoon.—Auto sight-seeing trip through the city of Detroit and Belle Isle.

This brought the official program to a close. It had been an interesting one throughout, with a record-breaking attendance that was thoroughly representative. Those who had feared that the associations could not make good in Detroit were agreeably surprised. Surre and Smith, veterans in the art of entertaining, had

Jack Brandt, Geo. Sherman and G. W. Greiss.

again done great and clever work, and the results of their endeavors must have been very gratifying to both.

FALOR UNAVOIDABLY ABSENT.

IT is doubtful if any of those who were unable to attend the Detroit convention regretted his enforced absence more keenly than did S. A. Falor, of the Goodyear Tire & Rubber Company. Mr. Falor was ill at the time, having found it necessary to drop everything to seek recuperation in the north.

NEXT SESSION IN CHICAGO.

THE next meeting of the Motorcycle Manufacturers' Association will be held in the New Southern Hotel, Chicago, Wednesday, October 19, beginning at 10 o'clock in the morning.

ENTERTAINED BY DAYTON CLUB.

DAYTON, O.—Several hundred riders from Richmond, Cincinnati, Lebanon, Springfield, Troy, Columbus, Piqua and other Ohio cities were entertained recently at Eby's grove by the Dayton club. The entertainment was in the nature of a picnic, with the customary games and contests.

COSHOCTON, O.—The city council of Coshocton, O., has adopted an ordinance providing that no person under the age of 16 years shall ride a motorcycle or drive an automobile in that city. The ordinance also forbids the use of unusual horns and signals and provides a fine for the use of a muffler cut-out.

Left to Right—J. W. Spray, W. C. Roby, S. C. Hurley and R. M. Barwise.

CONTINENTAL-ERIE HOSPITALITY

Thoroughly Enjoyed by Three-Score Jobbers and Others After the Detroit Convention

—The Program and Those Who Participated

CONTINENTAL and hospitality are evidently synonymous. The three-score jobbers who, after the Detroit convention, became for a night and a day the guests of the Continental Rubber Works, of Erie, Pa., are certain that the two words convey exactly the same meaning. The reception tendered by the Erie company served as a fitting climax to a delightful week.

There may be, somewhere in this old world, another host like T. R. Palmer, president and general manager of the Continental Rubber Works. But Mr. Palmer has no superior for—and there is no need for flattery here—a higher species of hospitality than that evidenced in Erie Saturday, August 10, is simply out of the question. "Ask the jobber—he knows."

Aye, the jobbers do know how Palmer, his fellow-directors and other Continental officials, in spite of a Weatherman whose wickedness was simply malicious, made happy their sixty guests, entertaining them royally at every turn, omitting not a single opportunity that afforded an opening for serving their guests.

The party left Detroit in three special cars attached to the nine o'clock train. From the very start, Messrs. Palmer, Surre, Tullis and Strickland were actively and, withal, joyously occupied, not in catering to, but always anticipating the desires of the jolly occupants of those three cars. A more contented set of travelers we have never seen.

Saturday morning, beneath a sky that promised well for the day, the party was taken from the train, in automobiles, to the Elk's Club, where breakfast was served.

Then followed an inspection of the plant where Continental-Erie tires, tubes, grips and other rubber goods are made. It required two hours to make the tour of the factory, and even within that time only a cursory examination of its well-planned departments was possible. The visitors learned, among other things, that three-quarters of the plant is in operation night and day; that a large new building, to be devoted entirely to the manufacture of motorcycle tires, is under construction, and would be ready in time to help the company meet the 1913 demand.

The plant is a model of the tire-manufacturing art. It is clean, scientifically laid out, and kept in operation by an unusually high class of employees. The company is constantly increasing its efficiency, the acquisition of new labor-saving devices being of almost weekly occurrence. One of the latest pieces of this type of machinery to be installed is an almost human contraption for cutting fabric on a bias, a by no means easy proposition.

In addition to being shown how tire shoes and inner tubes were evolved out of those odd-looking chunks of crude rubber, the visitors

were shown how the Continental Company manufactures such specialties as handle-bar grips, patches of all kinds, gas and lamp tubing and connections, many types of hoses, pedal rubbers, automobile and carriage bumpers, non-slip-lag for belt pulleys, rubber corks, etc.

The kneading of the crude rubber into flat pieces of available size and thickness; the care characterizing the operation to effect the proper composition; the painstaking manner in which the outer and inner tubes are brought to the marketing stage; the personnel and the splendid discipline of the employees of the factory—these and a score of other interesting details made the inspection tour well worth while.

A tasty luncheon was served at the Erie Club. By this time it was raining in torrents, and it poured at intervals during the afternoon.

During the brief dry interval, the party was taken in automobiles to the beautiful Kahkwa Club, splendidly situated on a knoll overlooking the lake. Although the intermittent rain and the saturated soil did not permit of much outdoor recreation, Mr. and Mrs. Palmer and Mr. and Mrs. Surre did not allow weather conditions to spoil their plans. What with dancing to music furnished by a stringed orchestra, card playing and the like, the afternoon passed quickly by.

Then came the dinner, its menu splendid from the mock turtle to the café noir. Three hearty cheers followed brief remarks by Messrs. Willis and Sauer expressing the appreciation of the party of the generous hospitality of which they had been the recipients. President Palmer responded in his charmingly modest way.

The following constituted the Erie party: Fred I. Willis and wife, Fannie C. Slocum, Hearsey-Willis Company, Indianapolis, Ind.; Jacob Roth, Albert H. Jarecki, Chas. S. Coleman, Continental Rubber Co., Erie, Pa.; Walter S. Tullis, Continental Rubber Co., New York, N. Y.; E. A. Neff, W. D. Tracey, Ball Fintze Company, Newark, Ohio; T. C. Larter, Lockwood-Luetkemeyer-Henry Company, Cleveland, Ohio; H. S. Smith, C. J. Smith & Co., St. Paul, Minn.; W. H. Grover, C. J. Smith & Co., Norfolk, Va.; C. J. Smith, C. J. Smith & Co., St. Paul, Minn.; C. C. Strickland, Robert Jarecki, James N. Thayer, Continental Rubber Company, Erie, Pa.; W. P. Swartz, Continental Rubber Company, York, Pa.; W. H. H. Wolfe, W. H. and L. C. Wolfe Company, Altoona, Pa.; Mr. and Mrs. A. J. Musselman, Allied Motors Corp., Chicago, Ill.; Mr. and Mrs. F. W. Grubb, Excelsior General Supplies Company, Chicago, Ill.; R. J. Leacock, Leacock Sporting Goods Company, St. Louis, Mo.; R. D. Webster, Eclipse Machine Company, Elmira, N. Y.; George W. Nock, Eclipse Machine Company, Philadelphia, Pa.; Mr. and Mrs. J. Warren Jones, W.

B. Jarvis & Co., Grand Rapids, Mich.; A. Wollerstein, Hub Cycle Co., Boston, Mass.; L. J. Palmer, Hub Cycle Company, Erie, Pa.; M. A. Henry, Vim Cycle & Hardware Company, Buffalo, N. Y.; Mr. and Mrs. Thomas J. Smith, Penna Rubber & Supply Company, Cleveland, Ohio; T. R. Palmer and wife, Continental Rubber Works, Erie, Pa.; L. D. Harden, Pope Manufacturing Company, Hartford, Conn.; W. F. Carroll, Utica Cycle Company, Utica, N. Y.; William Holland, Henry Keidel & Co., Baltimore, Md.; W. F. Remppis, Reading-Standard Company, Reading, Pa.; F. C. Jarecki, A. W. Brevillier, O. E. Becker, Continental Rubber Works, Erie, Pa.; George P. Miller, *Motorcycling*; Mr. and Mrs. A. S. Deysher, Mr. and Mrs. Keyser Frey, Reading Standard Company, Reading, Pa.; Mr. and Mrs. W. J. Surre, J. A. Vey, Mr. and Mrs. F. W. Fee, Continental Rubber Works, Erie, Pa.; Mr. and Mrs. G. H. Greiss, Continental Rubber Works, Philadelphia, Pa.; F. A. Brevillier, Continental Rubber Works, Erie, Pa.; Mrs. Robert Henry, Continental Rubber Works, Buffalo, N. Y.; C. E. Moorehouse, Standford Company, Torrington, Conn.; Alex. Jarecki, Charles Jarecki, Carl Jarecki, Continental Rubber Works, Erie, Pa.; Howard A. French, wife and son, Continental Rubber Works, Baltimore, Md.; Misses Alice M. and Mary Henry, Continental Rubber Works, Buffalo, N. Y.; Mr. and Mrs. J. Leo Sauer, *MOTORCYCLE ILLUSTRATED*, New York, N. Y.; Eugene A. Bolles, *Bicycling World*, New York, N. Y.

ANOTHER TIRE COMPANY.

AKRON, O.—The Marathon Tire & Rubber Company, of Akron, Ohio, has been incorporated with a capital stock of \$10,000 to manufacture rubber goods of all kinds, including automobile and motorcycle tires. The incorporators are Ellis R. Diehm, C. C. Owens, Sterling Newell, Donald McBride and H. J. Crawford.

NEW GOODRICH OFFICES.

AKRON, O.—Plans have been approved by City Building Inspector Goodwin for the erection of a large addition to the office building of the B. F. Goodrich Company. It is the intention to unite the office forces of the Goodrich and the Diamond Company. The new office building will be 228 feet long and five stories high. The cost of the addition will be about \$100,000.

COLUMBUS RELIABILITY RUN.

COLUMBUS, O.—At a recent meeting of the Columbus M. C. a committee was named to arrange for a reliability trial to be held some time this fall. The club will conduct a run Sunday, August 25.

MANUFACTURERS

GEORGE WAGNER RETIRES

Assets of Wagner Motorcycle Company Taken Over by Motorcycle Accessories Company.

THE announcement this week of the retirement of Mr. George Wagner from the motorcycle field, and the discontinuance of the machine that bears his name, comes as a great surprise to the trade.

Mr. Wagner, who was at the head of the old company, was one of the pioneer bicycle and motorcycle manufacturers, and as well-known throughout the motorcycle fraternity. During the past eleven years, in which his entire efforts have been devoted to the power-driven machine, he has developed an extremely strong, substantial and practical motorcycle of which he is justly proud. His efforts and success in the manufacturing department formed a very strong part of the foundation upon which the company has gradually increased their annual sales, from only 250 machines in 1901 to the present season's output, which ranges into the thousands.

Mr. Wagner's retirement and the sale of his interests in the business was due to a breakdown in his health which required an extended rest after many years of steady mental and physical work. He has been in Europe for the past six months on an indefinite visit to his native home and other points.

The Motorcycle Accessories Company has bought all of the Wagner interests, including patents, special machinery and the extensive stock of motorcycles, accessories and parts. They are increasing their manufacturing equipment, and after the present season's output is completed will discontinue the building of complete machines and devote their entire

factory to the manufacture of high-class accessories for all kinds of motorcycles, motor boats and to the development of improved parts for all models of the Wagner machine.

The new company has been launched under the guidance and control of Mr. Ed. Worthington and Mr. Ira W. Stewart, who are two of the most thoroughly experienced men in the American motorcycle field. Mr. Worthington has been general manager of the Wagner Motorcycle Company since its early years, and was a member of the firm during the greater part of this time. He is recognized as one of the shrewdest buyers in the business, and his extensive experience and former success is a strong indication for the future. Mr. Stewart, who has been sales manager of the former company for the past two and one-half years, had previously gone through every phase of the retail business, ranging from the small agency up to a distributing business, and with his keen observation this experience puts him in a position to see every proposition from the customers' point of view.

The new company will incorporate in the near future, and with their broader foundation will undoubtedly attain far greater proportions than they could have hoped to reach in the past.

GOODYEAR BRANCH IN BALTIMORE.

BALTIMORE, Md.—The Goodyear Rubber and Tire Company will erect a handsome building at Cathedral and Preston streets for the exclusive use of its local branch. The lease of property for a long term has been arranged and work on the structure will begin at once. It will be equipped with everything modern and will be ready for occupancy by the latter part of October. The cost of the building will approximate \$35,000.

TAKES OVER THE EAGLE

American Motor Company Will Market Machine Now Handled by Chicago Company.

CHICAGO, August 19.—W. T. Marsh, treasurer and manager of the American Motor Company, arrived in Chicago this morning on his way to the coast. Mr. Marsh will make stops at St. Paul, Minneapolis, Los Angeles, Portland, Oregon, San Francisco, Salt Lake, Denver and Omaha, returning by the way of Chicago.

When interviewed by a representative of this paper, Mr. Marsh stated that the American Motor Company would shortly take over the business of the Eagle Motorcycle Company, of Chicago, and would then be in position to place Eagle agencies throughout the United States and Canada direct from the factory. All Eagle machines will be equipped with De Luxe motors made by the F. Spacke Machine Company of Indianapolis.

Mr. Marsh is very optimistic about the outlook for 1913 and stated that he had ordered 2,000 motors for Eagle equipment alone.

The American Motor Company will make only two models of the M-M motorcycle outside of the Eagle line and will build nothing but 28-inch wheels for 1913.

All machines will be finished in grey, the M-M models being plain, and the Eagle machines finished in black paneling on the tanks and black and gold striping on the frame and guards.

RAY DAY, Pierce county distributor for the Merkel, has opened new and larger quarters at 954 South Tacoma avenue.

Laying First Floor of the New Plant of the Miami Co.

New Office Building of Miami Cycle & Manufacturing Co.

THE ELECTROLAMP.

MOST motorcyclists appreciate the convenience and other advantages of electric light for night riding, and the news that the Electrolamp Company, of 67 Atwater street, East Detroit, Mich., is bringing out an electric motorcycle lamp will undoubtedly be welcomed. The lamp, which is called the "Electrolamp" is of the self-contained type, having a storage battery fitted into the casing on which is mounted the lamp itself.

The battery case is of hard rubber with automatic connections, and the battery can be instantly removed by unlocking the door, no tools being necessary. Side lugs are attached to the casing, which fit any motorcycle bracket. The battery will give a continuous service of from twenty-five to thirty hours and should last two years. The cost of recharging is given as not exceeding twenty-five cents. The lamp proper is made with a heavy brass mount and bell, the reflector being parabolic with silver-plated surface. The finish is in

nickel, and the plating is heavy. The dimensions are 5½ inches over all, 6 inches deep and 4¾ inch front glass. The total weight of the Electrolamp is 4½ pounds. Standard brackets for any make of motorcycle on the market are furnished.

TO ORGANIZE SELLING COMPANY.

WILLIAM F. REMPPIS, has sent in his resignation as sales-manager and director of the Reading-Standard Company, taking effect on August 15. It is his intention to organize the Remppis Selling Company, and do business as a manufacturer's agent from a Philadelphia headquarters in the near future. Mr. Remppis states that he has not disposed of his stock in the Reading-Standard Company.

UNDER HEAVY PRESSURE.

REPORTS from the American Motor Company are to the effect that the Brockton factory is under heavier pressure now than it was in March, and that there are no indications of a falling off in the near future. The company has increased its normal pay-roll by fifty per cent. and the force is working overtime five days a week, but this extension—practically doubling the output—has not allowed the factory to catch up with the orders. Considering the lateness of the season this activity is unprecedented at the home of the M. M., and the company is contemplating a marked increase in its facilities in preparation for the 1913 season.

BACK FROM A TOUR.

GEORGE T. COCHRANE, L. P. Appleman, and Leo Tweedale, members of the Washington Motorcycle Club, have just returned from a week's trip through Western Maryland, Pennsylvania and New Jersey. A short time was spent in Atlantic City, N. J.

AIDS THE CARBURETER

Speedo Is Designed to Automatically Produce a Better Mixture.

THERE is a well-defined limit to the vaporizing and mixing power of the carbureter proper, by reason of its being limited to the initial contact of the fluid gasoline with the air. An uneven mixture, rare and rich in spots, is the result of this limitation, regardless of the fineness of the adjustment. Since the suction is greatest in the mixing chamber at the beginning of the stroke, it is evident that the mixture is the richest at this point, as more gasoline is drawn from the spraying nozzle, the mixture becoming leaner as the stroke progresses. The spray is therefore in an uneven state of subdivision because of the variable suction.

With a view to providing an auxiliary attachment that will increase the power of a motorcycle engine, permit of economy in the use of fuel, and prevent over-heating and carbonization, the Fulton McCutchan Company, of 1149 Michigan avenue, Chicago, distributors for the manufacturers, is marketing an auxiliary air attachment known as Speedo, which can be attached in five minutes to the intake manifold. It breaks up and remixes each particle of gas with sprays of new air, cutting crosswise through the mixture. It makes more air necessary and automatically injects just the proper additional air all running speeds require.

Speedo is sold under an absolute guarantee, and the purchase price will be refunded to any dissatisfied purchaser within thirty days upon the return of the instrument. The retail price of the motorcycle device is \$2. Concerning the operation of Speedo, its manufacturers say:

"In Speedo are embodied all features proper for an auxiliary of highest efficiency, designed not only to perfectly remix and revaporize the carbureter mixture, but to provide in that mixture the highest combustive quality at all speeds by maintaining constant proper proportions of air.

"It will be noted that with Speedo the auxiliary air injected is in direct proportion to the demands of the engine, and is entirely independent of the carbureter, or of atmospheric conditions. Because of the complete evaporation, more air is required with Speedo, for more fuel is actually burned with a given quantity of carbureter vapor. Thus, having a perfectly vaporized fuel, less is required for a given heating effect. Speedo does its work with a greater sensitiveness, and greater fineness than is possible in any carbureter proper."

Readers of MOTORCYCLE ILLUSTRATED will be interested in the company's advertisement on page 13 of this issue.

MORE BOSCH CONTRACTS.

THE latest contracts signed up with the Bosch Magneto Company include the Spacke Motor Company, Henderson Motorcycle Company and the Breed Manufacturing Company. These concerns will use the Bosch magneto exclusively on all 1913 models. It will be of interest to our readers to learn that with the addition of the contracts mentioned, the total 1913 specifications for Bosch magnetos will exceed 100,000.

MOVE GENERAL OFFICES.

THE general offices of the United States Tire Company have been moved to the new United States Rubber building, Broadway and 58th street, New York. This structure, the tallest north of 42d street, has recently been completed and will be utilized in future as the home of the United States Rubber Company and its subsidiary companies. The building is twenty stories high. The United States Tire Company will occupy the basement and sub-basement as a stockroom, the ground floor for its New York branch and the fifteenth, sixteenth and seventeenth floors as general offices. The company has over 400 employees in its general offices. The New York branch store will be moved into the new quarters about August 15.

Part of the New Plant of the Hendee Manufacturing Company.

NEW JONES FACTORY.

TO meet the greatly increased demand for its product, and to fill large speedometer equipment contracts with various manufacturers for the 1913 season, the Jones speedometer is trebling its manufacturing facilities, by fully equipping with special improved machinery at Bush Terminal, Brooklyn, an additional factory much larger than its plant at New Rochelle.

The New Rochelle factory will be continued at its full capacity, but the general offices and shipping department will, on October 1, be removed to the Bush Terminal, where, with ideal shipping facilities—loading directly to through freight cars at the factory door—four to eight days' freight will be saved on shipments to all western points.

On the same date, the commercial vehicle instrument shipping department now at the Canal place, New York City, factory—where the recorders, hub odometers and truck speedometers are made—will be moved to and consolidated with the speedometer service station in the Speedometer building, Broadway & 76th street, New York City.

FISK EXTENSIONS.

THE Fisk Rubber Company is making extensive additions to its plant in Chicopee Falls, Mass., in order to take care of the increased demand for tires. Contracts have been let to the Fred T. Ley Company, of Springfield, for two buildings. One building is to be 250 feet long, 90 feet wide, six stories and basement. The other building will be 200 feet long, 60 feet wide, four stories and basement. Special rubber machinery, boilers and engine for the power plant are to be installed which will increase the present capacity about 50 per cent. This extra capacity will necessitate the employment of 600 or 700 more workmen. The buildings are to be completed and machinery installed by November 1, 1912.

BOOKLET ON VANADIUM STEEL.

A BOOKLET has recently come to notice which should prove of interest to all manufacturers who are watching the development of the vanadium steel industry. The contents are unusually interesting, due to the fact that they are not merely a group of assertions, but rather a collection of reports on tests which prove beyond reasonable doubt that chrome vanadium steel contains valuable properties never before developed in any other steel.

Cuts are distributed throughout the book showing clearly the result of the different tests on springs, gears, axles, bars, etc., and the descriptive matter tells under what conditions the different tests were made. The booklet is being distributed by the United Steel Company of Canton, Ohio, pioneers in the manufacture of chrome vanadium steel, and will be mailed upon application.

BIG BUSINESS IN MOTORS.

DURING the Cycle Trades convention at Detroit, F. W. Spacke, of the F. W. Spacke Machine Company, of Indianapolis, sold 3,000 twin motors in three hours. Two thousand were ordered by the American Motor Company, and the balance by C. A. Crawford, of Saginaw, Mich.

OVER THE ROCKIES.

TO tandem over the Rocky Mountains for the first time is the aim of E. F. Winfield, of Grand Junction, Col., with Mrs. Winfield as passenger. The crossing will be made over the Tennessee Pass, at an altitude of 10,400 feet, while the distance to Denver is

437 miles. If successful, Mrs. Winfield will be the first lady rider to cross the Rockies by motorcycle, either on tandem or solo. The machine used is a single-gear Indian 7, with 3-inch rear tire and a reduction of 5.2 to 1. Four to five days is figured on to complete the trip and part of the run will be at an altitude of 9,000 feet.

H. GLENN DAVIDSON has joined the traveling staff of the Troxel Manufacturing Company.

BLAIRS County, Pennsylvania, recently celebrated Flying Merkel day and was invaded by scores of riders of that machine.

**CELEBRATED REACHING THE TOP.**

WHEN the top of the building forming the addition to the Harley-Davidson Motor Company's plant at Milwaukee was reached on July 31, the occurrence was celebrated after the usual Milwaukee custom. A Christmas tree was erected on the top of the hoisting elevator framework, and Walter Davidson responded by providing the contractor's men with two half barrels of Milwaukee's famous product. The two-story building with the square chimney showing above the temporary filing shed in the foreground is to be replaced by a concrete building similar to the one now under construction. There will be an additional twenty-seven thousand square feet with the completion of this last building.

"U-VULK" LIQUID VULCANIZER.

THE Gem City Liquid Vulcanizing Company, of 1021 East Third street, Dayton, Ohio, are bringing out the "U-Vulk" liquid vulcanizer for rapid repair of inner tube troubles. The liquid is used cold and contains no acid; it vulcanizes quickly, and when used with liquid rubber makes a durable and permanent repair unaffected by heat or friction. The "U-Vulk" outfit consists of a bottle of the liquid solution, a roll of Para rubber, a can of liquid rubber, patches and brushes all packed into a neat screw-top can which fits in the tool bag. Each item is packed separately and thus is kept in good condition at all times. The outfit complete is quoted at \$2.50.

TRIUMPH DELIVERY VAN.

THE Triumph Manufacturing Company, of Detroit, Mich., is about to place on the market a delivery van of the motor tricycle type, with two wheels in the rear, two-speed transmission and other features. The machine will be marketed at a very moderate price and will be ready in the course of six weeks or two months.

PLANs for a Labor Day meet have been made by the Davenport (Ia.) M. C. on the Davenport mile track.

QUICK WORK FOR ADDITION.

WHILE the masons and bricklayers were still at work, line shafting was being installed in the addition to the Harley-Davidson factory, thus expediting the work in an economical manner. As fast as the flooring, etc., is completed the work of installing the machinery will be carried on, following the plans for the layout made by the Federal Engineering Company in consultation with Messrs. Harley, William Davidson, John and Northman. The offices and that portion of the machine shop on the first floor will be moved into the new building the latter part of this month.

The shipping facilities are being increased by the installation of a siding, while the brick wall of the structure is growing rapidly. Already several drill-presses and a cold saw are being operated to prepare the holes for the machinery foundation bolts and for the racks for round and flat stock. A second track can be run through the building and will be at the basement level when completed. This depressed track is in accordance with the regulation in Milwaukee that grade crossing are to be avoided, and five feet depression will satisfy this regulation.

SUIT WITHDRAWN.

THE Lovell-McConnell Manufacturing Company, of Newark, N. J., maker of the Klaxon warning signal, which brought motion for an injunction against Chas. E. Miller, of New York, for handling the Newtown horn, has withdrawn the motion.

BAY STATE RACE MEET.

THE Boston M. C. will hold another open race meet at Atwood Park, Saugus, Mass., on Labor Day. The best riders in New England will compete.

The first meet, held July 20, was full of snap and action from start to finish, and was pronounced by old-timers as one of the very best they had ever seen. It is the aim of the club to make this one even better. Entry blanks may be obtained from W. F. Mann, 356 Columbus avenue, Boston.

AN ideal transmission for motorcycle service should have all of the following qualities: Durability, efficiency, flexibility, simplicity, cleanliness, quietness, low first cost and cost of upkeep, and minimum wear and tear on the machine and its parts. The latter quality is particularly desirable, as some very efficient forms of transmission distort the frame and shorten its life very appreciably. Another important quality is the lightness of the transmission as a whole. The writer holds that these characteristics are embodied in the best proportions in the V-belt.

The V-Belt.

In durability, the right kind of a V-belt, when properly fitted as a transmission, is equal to that of a chain. There are numerous cases of leather V-belts lasting well over 5,000 miles running, and that over far from ideal pulleys. A V-belt is flexible laterally as well as radially and longitudinally, but the nature of its contact surfaces will not result in slip, even with great differences in diameter between the driver and driven pulleys. While made up of two or more plies and blocks, it is simple, needing but two pulleys to transmit the drive. Its flexibility and at the same time its tendency to hold on to the pulleys give a minimum of strain on the frame parts of the machine. It is but slightly lighter as a whole transmission than a flat belt transmission of twice the belt face, but power for power, the V-belt is actually lighter than the flat. An inch four-ply V-belt will transmit nearly four times the power of an inch two-ply flat belt.

It is obvious that a one-inch V-belt will permit of a narrower frame than a four-inch flat belt, or even than a two-inch flat belt. The V-belt depends for its power on the side faces in contact with the pulleys, and not on its width, hence a relatively narrow belt with deep side faces will transmit more power than one with shallower side surfaces. Constructional limits permit the use of V-belt transmission on even the highest powered machines, but the flat belt within these limits will barely transmit six horsepower. The V-belt can be used wherever the chain is used and the gear ratio may be changed by the use of different sized pulleys as readily as a chain drive ratio by substituting different sprockets. Variable pulleys may be used, operated by the rider in the saddle, and this is the only form of transmission where this is possible.

There is comparatively no slip to a V-belt, but there is about 3 to 4 per cent. creep, depending on the tension. But it is not at all

necessary to apply the maximum tension, as a one-inch 4-ply V-belt running at moderate speed under a tension of 70 pounds per inch of width per ply will transmit as high as twelve horsepower. After considerable research and experimenting, the following have been found to be minimum diameters for various V-belts: Four-ply, $3\frac{1}{2}$ to 4 inches; five-ply, $4\frac{1}{2}$ to 5 inches. The writer feels that these are still too small and advocates not less than $6\frac{1}{2}$ inches for a four-ply and 7 inches for a five-ply. The most efficient pulley diameter, as far as road and racing service has shown, is 8 inches.

For racing, the chain is probably the better than the V-belt, but very few riders race. The V-belt has its records on the road and track, as well as for hill-climbing and touring. Take the Tourist Trophy races this year. The Junior race for machines up to $2\frac{3}{8}$ horsepower had the first eleven riders all on belt-driven machines. In the Senior race, second, third, fourth, fifth, sixth, seventh, ninth, twelfth and fourteenth places went to V-belt machines. The winner of the 1910 Tourist Trophy event (Collier) rode a V-belt machine. The holder of the English speed records for four horsepower machines used a V-belt. A rider of a single $3\frac{1}{2}$ horsepower machine rode 40,000 miles in forty weeks, using less than six belts for the entire distance. The V-belt is superseded by the chain for occasional heavy side-car and speed work only in Europe.

Where the V-Belt Is Handicapped.

It is probable that the V-belt would not have lost any of its popularity if it had not been handicapped by a number of conditions, namely: Too small motor pulleys; too shallow

belt grooves; improperly made pulleys; weak belts; insufficient guarding from mud, etc., and lastly, overloading of the whole transmission. All but the last two are constructional neglects; there has never been anything done this side of the Atlantic to protect any belt transmission, and the last came from ignorance or the desire to cut down production costs. These faults are generally true of manufacturers of V-belt machines the world over. The remedies are simple.

Pulleys Too Small.

It is a belt axiom among technical and belt men, that where possible the diameters of the driver and driven pulleys should be equal or as nearly equal as possible under the conditions of operation. On a single belt transmission, to get a 4 or 5:1 ratio, the front pulley is usually 4 inches and the rear pulley 16 to 20 inches. The latter is so large that it will take up mud or dirt and hit the ground when taking corners. Dirt and even stones thus get wedged in between the belt sides and the pulleys and grind down both, or the rim is bent on striking a rock or the like. Over the little front pulley the belt is bent too much, and soon wears out or loses its life. The blocks on one particular make of machine have shown signs of wear by rubbing together as they pass over the front pulley. The remedy is obvious, viz., use larger front and smaller rear pulleys.

The ratio has to be maintained, however, and there are two tried ways of doing away with the trouble. The first of these is the double drive, the first drive to a countershaft and the final to the rear pulley. The arrangement necessitates the addition of another form of transmission, and the one in the illustration em-

Compound Chain and Belt Transmission.

V-Belt Transmission with Undergearing.

plays a chain for initial drive and a V-belt for final drive. This is used on the (English) 2½ h. Douglas and 8 h. Williamson machines. The motor shaft has a small sprocket and the countershaft a larger one. The clutch is fitted to carry the countershaft sprocket. The countershaft has an 8-inch V-pulley and the rear wheel a 15½-inch belt rim. The total ratio is 4.1 from the motor to the rear wheel. The rear pulley looks large, but is calculated for a 24-inch wheel; on a 28-inch wheel, there would be two inches more clearance. Where a two-speed gear is fitted for use on our roads, the countershaft position is the only practicable one. This drive arrangement has the positivity of the chain drive for the highest speed in the transmission (motor to countershaft) and the flexibility of the V-belt drive to the rear wheel. The slip comes at the rear wheel, hence the belt takes better care of it than would a chain or any other final drive. There is no reason for close adherence to the exact ratio of sprockets and pulleys shown; the pulleys could be made nearer to the same diameter and the reduction be had in the sprockets. Change of gear ratio is effected by changing the front sprocket, the same as on a chain-driven machine.

Undergearing.

Where a clutch alone is to be used, and a single belt transmits the power, the arrangement shown in the next figure has been found efficient. It was first used by the N. S. U. makers, and is used successfully on the chain-drive R-S. machines today. On the motor shaft is a spur pinion, and this meshes with an internal gear carrying the front pulley. This gives a small rear pulley, and puts the power where it is best applied; that is, to the driver pulley. By the undergearing arrangement, the motor is permitted to run at a high speed and give off its maximum power, while the belt runs comparatively slowly, but at close to an equal velocity over both pulleys, and minimum wear results. The advantage is based on simple mechanical principles.

The drum carrying the internal gear is mounted on a sleeve which pivots around the extension of the motor shaft and has an arm C ending in a nut. This nut fits on a screw on the end of rod A, and a casing, B, encloses both. To take up belt slack, the rod A is turned to move C in the direction of the arrow; this swings the drum upwards and tightens the belt by increasing the distance between the pulleys. It is used as a free engine device on the N. S. U. machine by slackening the belt (approaching the pulley toward the rear one) by raising the arm C and lowering the drum. The clutch on a transmission of this form

should be located in the front drum, and the eccentric mounting need not be used. Mr. Frank Dolt, chief engineer of the R.-S. company, suggests the location of the clutch in the front pulley.

Right and Wrong Fits of V-Belt.

Grooves Too Shallow.

This is a frequent fault with pulley makers in general. By reason of the little pulleys now

used the space between the bottom of the groove and the wall surrounding the motor shaft was very limited. The result is that the belt, as it wears, "bottoms" in the (usually) flat bottom of the groove, and tears apart or grinds itself off at the bottom. The transmission of the power is then by a series of jerks rather than by a continuous pull. A typical example is shown in the accompanying figure, where the belt, normally of good shape, has bottomed in the groove. The same action, though to a lesser extent, occurs when the belt is too small for the pulley or the pulley too large for the belt.

The proper fit is shown in the half-section of a 6½-inch pulley. For an inch belt there is allowed ⅝-inch clearance, and the bottom of the groove is the arc of a circle. No matter how much wear there is in a belt, it cannot bottom; it will wear out first. The correct angle, 28 degs., is also indicated.

Improper Pulleys.

If the belt is too big for the pulley or the pulley not 28 degs. angle, the effect will be as shown in the next figure. Here the belt lops over on both flanges and is distorted through all the plies. If the pulley is made of ordinary cast iron or steel, the belt will grind it away to a sharp corner as at A, and the upper ply will be cut away or tear off. A belt running under these conditions goes to the scrap heap in short order. A good design for the flange ends is shown in the figure for a 6½-inch pulley.

Weak Belts.

These are generally belts which are too small for the power to be transmitted or are improperly designed. The advice of a belt man as to power is distinct economy as compared with the so-called "practical experience" of the average designer. Very little is known about V-belts outside of the belt makers themselves, and they are constantly experimenting in their own plants or under their direction in laboratories. Most people when sick consult a doctor rather than a glass-blower.

There is no excuse for an improperly designed belt.

Overloading Belts.

There was a time when a single size of belt was made to do for all models turned out by the manufacturer. This was all right as long as the belt was strong enough for the most powerful model made, when it was distinctly economical for the smallest motor. This was (and unfortunately in some cases is) usually not the case; the small belt "does" for the big motor. The result was short belt-life and

Efficient Guarding for Direct Belt Drive.

general dissatisfaction, and this was one of the causes that made the V-belt unpopular. Cooperation with the belt maker is the obvious remedy.

Mudguarding.

All forms of transmission operate best when clean; that is, free from mud, dirt and water. On a machine with footboards the belt can be kept quite clean by fitting wings at the front of the boards and shallow flanges below the belt to the rear stays. But this is a pedal-country, and the best remedy is to house the transmission in completely, a thing perfectly possible and convenient with either of the forms suggested above. A housing of sheet metal is shown in the last figure. It is fastened to the crankcase forward and to the rear stay and fork at the rear. The proper aperture for the pedal crank is easily made, or the portion adjoining the bracket can be recessed. The Clyno motorcycle uses this on both the belt and chain models. The rider can be kept clean by using such a housing, as the belt or chain throws dirt over him, and occasionally water over the motor.

A Simple Fastener.

The V-belt is one of the easiest to fasten, and a simple method of coupling the ends is here shown, a four-ply belt being used. The end blocks are cut away and the rivets ex-

tracted. The plies are pointed and laced together as indicated and a flister-headed bolt effects the coupling. Under the head is a thin washer, and there is another under the nut. There is a lock-nut fitted under the regular nut in this design. For a simple fastener there is no device that can better it, and the resistance to tearing apart is the strength of the four plies taken together. The coupling takes up no more space than a belt block.

TOWANDA RACES, SEPTEMBER 10.

BRADFORD, Co., Pa., is to have its first big motorcycle meet on September 10, when the Towanda M. C. will hold a series of events.

HELD TANDEM PICNIC.

COHASSETT BEACH was the scene of a novel tandem picnic held on August 4 by the Hozinam (Wash.) M. C. The members took the boat to Westport and rode the beach to Cohasset, where lunch was served. Races were held on the sands during the afternoon, the tide allowing of only three events being run off. The summaries:

30.50 stock, four miles. Won by Kimberk; second, Hall. Time, 6:53.

61, stock, eight miles. Won by French; second, Kimberk. Time, 10:55.

53, stock, four miles. Won by Kimberk; second, Smith. Time, 6:13.

SATURDAY'S PHILADELPHIA RACES.

THE attendance at the Point Breeze Motor-drome, Philadelphia, Saturday, the 17th, was comparatively light, on account of the inclement weather. Only three events were run off. The fourth, the unknown distance race, had to be called on account of rain. In the Class B event there were five entrants, and at no time during the races were the contestants more than fifty feet apart. Hartley Thomas, the Western rider, was again in form, coming in first in the Class B and also winning the match race, with Harry Klebes, the local butcher boy. Vanderbery was leading the field in the last lap of Class B when he broke his gasoline pipe. In the open event he broke his handle bars.

Summaries: First heat of Class B, 4 miles—Won by Klebes; second, Thomas; third, Veditz. Time, 2:55. Final heat won by Thomas; second, Vanderbery; third, Klebes; fourth, Veditz. Time, 2:10, for 3 miles.

First heat of open event, 4 miles—Won by Vanderbery; second, Klebes; third, Veditz. Time, 2:53½. Final heat, 4 miles—Won by Thomas; second, Klebes; third, Veditz.

First heat of special match between Thomas and Klebes—Won by Thomas. Time, 2:13½ for 3 miles. Final heat, 3 miles—Won by Thomas. Klebes did not finish. Time, 2:12½.

LANTERN PARADE IN NEWARK.

THE N. J. M. C. will hold its first lantern parade about September 15. A committee of ten members have been working on it for the last three weeks.

ANOTHER 24-HOUR RUN.

THE New Jersey Motorcycle Club, Inc., will hold its Fall 24-Hour run on August 31 and September 1, the event being open only to amateurs. A unique feature will be in the classification, which consists of private owners, trade riders, passenger, and ladies invitation classes. In the passenger

class, side-cars, tri-cars or tandems are eligible, and passengers must weigh over 110 pounds to qualify. In the ladies' invitation class, there is no entry fee, and any lady finishing the entire course as passenger or rider will receive a special medal. The route is from Newark to Freehold, Trenton, Somerville, Phillipsburg, Hackettstown, Port Jervis, Newburgh, N. Y., Suffern and Newark, a total distance of 325 miles.

COMBINED MEET.

SEPTEMBER 1 and 2 are the dates for the combined motorcycle and horse-race meets at Bates Park, Saginaw, Mich. The two-wheeler cards will have amateur and pro events, and special exhibition features by the Merkel riders from Detroit.

A BIG OPPORTUNITY.

"**W**HAT a wealth of literature," says an English writer, "there is in a journey!"

How many millions of miles do British and American tourists cover in a year? They see the canals of Bruges, knowing neither whence the canal boats come nor whither they go. They drive in a drosky through a Russian city, gazing at statues and spires and never hearing what the driver says to his pair.

They call this "doing things"—doing Belgium, doing Russia. And it is because British people have fallen so into the habit of "doing things"—of sightless sightseeing by clock-work—that some hundreds, or perhaps thousands, of motorcyclists are now sitting at their desks with knitted brows and wet cloths around their temples, bemoaning that it is so hard to make an essay on a motorcycle journey.

The essay they want to write will be worth the writing.

The motorcyclist should merely put in words the hints, the gains, the wrinkles he learns in a motorcycle journey. And some think it is difficult.

Read what Tom Brown learned when he went to Rugby on board the tally-ho—how straw will keep the feet warm better than the finest lady's muff; just what to drink when the coach pulls up; how to begin and how to end a peashooter fight. Read "A Sentimental Journey," and, leaving the sentimental part aside, see how much there is in the journey alone.

Read—oh! read any of the thousand and one journey books published in a year, and then see if you cannot do as well with a motorcycle trip.

There is such an enormous area for the essayist to disport in. Is he a schoolboy? Then he will ride to school next half armed with a dozen hints on saving gasoline, on keeping his tires fit, on cleaning up that he did not know when he made his first schoolward journey last term.

Is he a territorial, whose motorcycle must bivouac with him, must always be reliable under whatever strain mimic war demands? Then he knows how to reduce his accessories to a compact minimum, in which lightness and efficiency combine in a wonderful co-partnership.

Is he—and this is what he most probably is—just an ordinary man, who keeps his motorcycle for pleasure and likes to get the best he can out of it with the minimum of cost?

Does he not adopt some plan, all his own, for preventing damage by damp or oil while his steel steed is housed in its little stable?

He must. Else why do some men seem to run their motorcycles on nothing a year, while others contrive to make them cost as much as a six-seater car?

We all know the motorcycling Jonah. His accessories come loose because he does not know how to fix them. His tires rot because he does not know how to care for them. His journeys cost double as much as the train fare.

If we are not of his company, it is because we have learned ways to avoid these things.

Our little contrivances may seem obvious. But it will not do to take it for granted that they are so. Any one of them—so simple, so perfectly straightforward once you have been told about it—may settle a problem.

A fisherman on the Thames bank, beginning his career, will offer a roach a morsel about as dainty, from the fish point of views, as a flyblown cod's head would be to an habitu  of a West End supper room. But it only takes a chapter of Izaak Walton or half an hour's demonstration by one of his modern disciples to put that novice of the lure into the way of serving up, for roach and dace and gudgeon, a *bonne bouche* that no well-bred coarse fish can resist.

The motorcycle has not yet found its Izaak Walton. But any man who feels conscious that he runs his motorcycle cheaply and well, and gets out of it the pleasure he desires, may be the Izaak Walton of motorcycling.

CLUBS IN LARGE CITIES.

VISITING motorcyclists and others coming to the larger cities frequently express wonder that the motorcycle clubs are so indifferently provided as to quarters, and think but meanly of riders who will meet in a repair shop, holding their "business" sessions while seated on boxes, work-benches or greasy stools. The comparisons of tourists from even small towns between their own comfortable quarters and conditions such as the above would be amusing were they not a reproach to the two most interested parties, the agent and the rider.

There are reasons for this state of affairs, but the criticisms can hardly be termed unjust, nevertheless. Property is very high, and agents to keep their rentals within bounds, especially in a dull season, must sacrifice club

space and the like. Many motorcycle agents came from the ranks of bicycle agents (and builders) and cannot afford to lay out money for additional floor space; hence the club meets in the shop or in even less favored quarters. Again, the business methods of the average agent are crude; many keep their accounts in a single book, putting down the sales as they come in, and knowing little how they stand from month to month. With such methods of accounting, it is no wonder that they lack the proper "go," and that the club proposition is far away.

But the riders themselves are also to blame. A large city has numerous attractions, and these generally develop the dilettante or "boulevard rider," whose delight is a high-powered mount which he rides up and down the smooth asphalt streets or brags of how many similar riders he has "cleaned up" during an exciting quarter-mile run. To form a club of such material means lack of unity and seriousness of purpose, too often the most noticeable characteristic of metropolitan clubs, so-called. They, the members, are content to put up with anything they can get and rejoice in arm-bands or insignia rather than in awards for road performances.

Obviously, riders of that kidney do not help the agent to benefit by the existence of a club. The machines sold for highway incendiarism are in the minority, and the speed talk drives away the serious rider, and spoils possible sales. General conversation is also rarely what it should be.

The remedy is for the riders and agents to get together and provide proper club facilities, spending a little money and taking pride in the appearance of the quarters, and in the fact that the club is an organization of touring riders, not boys who use the two-wheeler only when there is nothing better to do. A leaf may be taken from the books of numerous social organizations. When the necessary money for their rooms was not at hand they appealed to their friends or issued bonds to cover the needed amount. That this can be done and is done all the time is proof that, with rare exceptions, it can also be accomplished in the cases of most clubs today. It should not be necessary to have to point out to an agent the value of having a club in connection with his garage.

There are well organized clubs in our great cities, but they are few, and the others stand out by contrast. To the good ones, the above is an old story; to the others it should be of benefit.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

THAT motorcyclists are taking deep interest in the Improvement Contest now being conducted in these columns, is evinced by the numerous suggestions received daily. Most of them are essentially practical, and all are worthy of close attention by those who are devotees of the two-wheeler. The second series of suggestions is published herewith. The conditions of the Contest are reprinted below for the benefit of those who have not read the original announcement in *MOTORCYCLE ILLUSTRATED*.

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the best twelve suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

IMPROVEMENT IDEAS DESCRIBED AND ILLUSTRATED

FUEL TANK FLOAT.

IN order to ascertain the level of the fuel in the gasoline tank a float and level indicator is suggested as an improvement. In the drawing, A is a fixture fitted to the top of the tank and having the upper part threaded. This fixture is bored to take a brass rod R on whose upper end is a knurled nut K threaded internally to mesh with the upper

portion of A. The rod is graduated and has a cork float F on its lower end. Normally, the nut K is screwed down on A, submerging the float F as in the right-hand view, but when the level of the gasoline is to be ascertained, the nut is unscrewed, whereupon the float forces up the rod and nut and the markings at the mouth of the fixture A show the level. Contributed by A. E. Newman, Chicago, Ill.

SPRING SELF-STARTER.

THE difficulty many riders have in starting is to be remedied by the use of the spring-operated starter shown herewith. The starter mechanism is contained in a cylindrical casing

fastened to the left side of the motor. It consists of a lever A carrying a spider on which are pivoted a train of gears. The main gear G meshes with a large gear K and also with the upper of two equal sized gears H and H₁. To G is fastened a barrel M, one end of a coil spring R being fastened to M and the other to the casing. There is a ratchet device for gear G operated by the button B. The upper part of lever A moves over a blank quadrant FC, on which the positions S and W indicate the positions for the lever to start and wind the spring respectively. The spring normally remains unwound, and the lever is in a notch in the center of the quadrant. With the motor running, to wind the spring, move the lever to W. This meshes gear K with a gear L on the crankshaft of the motor and the spring is wound by the rotation of the barrel M and gear G, in the direction of the solid darts. It is held from unwinding by the ratchet. To start the motor, with the spring R wound, move the lever to S. Press button B, releasing the ratchet. The spring will unwind, rotating H to the left, H₁ to the right and L

which is now meshed with H₁ to the right. The unwinding of the spring will turn the motor over, but the lever must be quickly moved to the neutral notch to prevent overwinding. For further ease in starting a small Prest-O-Lite tank D is fitted, communicating with a tube E to the inlet pipe. A valve V is fitted to the pipe to give a charge of acetylene gas. The valve is normally held closed by a spring. Contributed by Earl Cline, Marietta, Ohio.

HANDLE-BARS AND GUARDS.

AS an improvement, it is suggested that handle-bars be bent as in the drawing and that a brace bar be fitted. Chain-driven machines should be guarded by casings F and G for the front and rear drives respectively. The use of wider chains is also suggested. The brace on the bars is needed in ordinary riding as well as over poor roads, while the drop renders riding more comfortable. Chains of the silent type should be satisfactory. Contributed by Howard Butler, Lynn, Mass.

TANK FRAME CONSTRUCTION.

A TANK-FRAME construction, top member being 4 to 5 inches diameter and downcomers 3 inches, with loop to hold motor and muffler in lower end of front downcomer. (b) A two-stroke "4 by 4" motor fitted with plain bearings and fitted to loop and by lug to frame at top. Oiling by injection with the fuel. (c) Double ignition, battery and magneto. Cells and coil to be carried in rear downcomer tube. (d) Wide V-belt transmission and free-engine device. (e) Bowden wire control. (f) Extra cross-bar for handlebars. (g) Double truss forks with connections direct to bars. (h) Sufficient clearance for 2 3/4-inch tires, both front and rear. Contributed by Axel Everson, Penn Yan, N. Y.

FOLDING REAR MUDGUARD.

THE mudguard is hinged to permit the withdrawal of the rear wheel for tire and like repairs. Pivoted to the rigid or forward section is a locking plate whose forked ends fit under thumb-nuts on the rigid and hinged portions of the guard. On releasing the thumb nuts on their screws, the bar can be swung to one side, when the hinged portion can be raised and the wheel removed. Contributed by B. T. Ellis, Baltimore, Md.

This mudguard is fitted so that the lower portion can be slid in grooves forward into the rigid portion, thumb-nuts or bolts holding the guards in their proper relation to each other when riding. The release and withdrawal of these nuts and bolts allows the rear guard to slide below the rigid part and expose the wheel to direct removal to the rear; also contributed by Mr. Ellis.

INJECTOR CUT-OUT FOR EXHAUST.

AN injector device for attachment to the exhaust pipe of a motorcycle. Used to prevent back-pressure during the exhaust stroke. Exhaust pipe connected to smaller

tube and bells admit air into the continuation of the pipe. During the other strokes, the device will act to relieve the exhaust gases through the bells. The main portion of the exhaust passes into the muffler, while the remaining gases back out through the injector. Contributed by S. Cleaves, Cambridge, Mass.

LARGER MUFFLERS.

PROBABLY the noise which is most objectionable about a motorcycle is that of the high pressure exhaust gases. Among the several things that tend to give character to this noise are: the amount and quality of the explosive charge, the ignition timing, valve

timing, and peculiarities in the form of the exhaust pipe and muffler.

As far as size goes, present-day mufflers are efficient, but considerable back-pressure is created and noise is by no means absent. Mufflers of over four to five times the cubic capacity of the motor have been found to be necessary if complete silence is desired, but smaller mufflers, if made noiseless, would have a stifling action on the motor, and it is this back-pressure which is desirable to overcome. That is, the maximum of silence and the minimum of back-pressure go to make the ideal muffler.

A lack of space handicaps the installation of large mufflers to a great extent. Practically the only space now available on the majority of machines is that generally occupied by the tool-box; i. e., the space between the rear wheel and the seat post. This space is desirable for a large vertically-hung muffler. This large muffler would have the present baffling arrangements, only on a larger scale, and so arranged that they would not rattle or work loose. It should, of course, be either self-cleaning or readily cleanable. A rear ejector pipe would probably tend to direct any noise left, away from the rider.

On such an apparatus an ordinary cut-out would not be necessary. Instead, it could have an arrangement whereby the baffling action could be altered progressively, if desired, opened so that the regularity of firing of the engine could be tested, or closed enough to produce complete silence. Contributed by Harold R. Shoemaker, Rochester, N. Y.

FRICTION TRANSMISSION.

FOR general riding, a variable gear of the friction disc type is suggested. A is a friction disc, 6 inches in diameter, and B a friction wheel 3 inches in diameter. This lat-

ter wheel slides on the feather D fitted to the shaft C E, and F is the bevel gearing on the rear wheel. View G shows the side of the wheel B, and H is the slider fork for shifting B along A, to get the various ratios. The fork is controlled by lever I, while at K is shown a cross-section of the stem of H. The ratios are determined by the position of B with regard to A; when B is at the left as far as it will go, the highest speed is attained. B being slid nearest to the center gives the lowest speed, and on being placed at the center of disc A, gives practically a neutral or free engine position.—Contributed by Elmer F. Hathaway, Cambridge, Mass.

SPRUNG REAR WHEEL.

AN arrangement in which the rear wheel is suspended by full-elliptic springs on each side is suggested. There are two additional stays, CF, one to each side, and the springs are attached by hangers AE, having L-shaped pieces at the bottoms to carry springs. Short stay DE is used to brace hanger in place. Stay BF, usually attached at A, is brazed on at F. Mudguard is fastened at G and hinged there to allow of the

motion of the rear construction. The wheel and device play up and down around the centers B and C.—Contributed by J. A. Gist, Wellsburg, W. Va.

CHAIN ON RIGHT SIDE.

WITHOUT doubt the free engine clutch as applied to a motorcycle is the greatest improvement that has been brought out. The machine without a clutch is a has-been. Therefore, as the clutch is here to stay, why do the manufacturers, without an exception, make the use of the clutch hard by placing it on the left side of the machine? Simply because the machine is driven from the left. What is to prevent reversing this order? Let the 1913 machines be right-hand drive, with the clutch of easy access, on account of its necessity (1) to quicker handling, (2) safety, convenience and comfort is obvious, (3) adaptability, not a single extra part, (4) mechanical perfection, and the rest of the nine points are covered in that the arrangement speaks for itself.—Contributed by Paul L. Rathbone, Bloomfield, N. J.

PATENTS

New Coaster Brake, Spring Frame, Luggage Carriers, Grip Handle, Spark Plugs, Etc.

1,025,598. Coaster-Brake. Patented May 7, 1912, by Patrick W. Toohey, Colorado Springs, Col., and assigned to the Toohey-Doolittle Co. In this brake the hub-shell is double coned and the breaking mechanism consists of cones slidably mounted on a spindle and operated by the movement of the pedals. The ends of the cones are cut with a groove and in this groove fits a corresponding projection. The small ends of the cones are shouldered to prevent rotation individually or together. When the rider back-pedals the cones move inward, gripping the interior of the hub-shell, and being rendered stationary, effect the braking. On pedalling forward the cones move outwardly and release the hub-shell and float on the spindle.

1,030,844. Convertible luggage carrier and tandem. Patented June 25, 1912, by Bert L. Howell, Danville, Ill. This attachment is designed to be fitted to any machine, readily adjusted to different heights of persons and readily convertible from carrier to tandem seat or vice versa. The frame consists of fore-and-aft members attached forward to the rear fork of the machine and to legs forming a yoke at the rear. These legs have stirrups at the ends for the passenger's feet and carry springs on the top

No. 1,025,598—Toohey Coaster Brake.

No. 1,030,844—Howell's Luggage Carrier.

No. 1,029,771—Stephenson's Spring Frame.

bar for the springing of the carrier frame. This latter is sprung forward on a U-brace attached to the adjustable fore-and-aft members. A seat is put over the carrier when used as a tandem attachment; but left off when luggage is to be carried.

1,029,771. Spring-frame for motorcycles. Patented June 18, 1912, by Chas. G. Stephenson, Denver, Col. In this device, the rear stays are pivoted in rear of the pedal-bracket and form the lower members of the double triangular frame, the rear forks forming the two upper members. The ends of these forks slide in fixtures to compensate for the spring motion. Arms at the rear of the double triangle project downward and serve as hangers for the ends of quarter-elliptical springs, whose bases are attached to a Y-plate fastened to the frame-loop. The object is to decrease vibration transmitted to the rider and the power-plant. The motion is rocking about the pivot before mentioned.

1,031,165. Luggage Carrier. Patented July 2, 1912, by Julius Biderman, New York, N. Y. This is a front luggage carrier whose attachment is to the fork sides and to the handlebars by metal straps with hook ends. The ends fastening to the forks from Ys which clamp over the sides, the load on the carrier holding

No. 1,031,165—Biderman Luggage Carrier.

it more firmly in place. The construction uses no screws, etc., and is removed and replaced by lifting off or on.

1,030,866. Motorcycle Grip Handle. Patented July 2, 1912, by Wm. F. Boast and Wm. B. Conrad, Sterling, Col. This is a handle or grip with sufficient resiliency to relieve the arms of the rider from jar, etc. It consists of

No. 1,030,866—Conrad Grip Handle.

a rubber grip within which are spiral springs, on the end of which is a spade-handle for turning the said grip. The second grip is fitted with a spiral spring similar to that of the first. The grip is positioned with a considerable overhang from the end of the handlebar. The spade-handle position is also to be assumed when a change of hand-position is desired.

1,028,200. Spark-Plug. Patented June 4, 1912, by Chas. C. Eldridge and Edwin J. Beebe, Marshalltown, Iowa. This is a plug with adjustable and readily-cleanable electrodes. There are five electrodes, four radial and one central. The radial ones are fish-tailed at the ends to get a more powerful spark, while the central one is round. A gauge for adjusting the proper distance between the points forms the upper cap on the outside end of the central electrode wire, the points fitting into the notches of the radial electrode ends as shown.

WE have received a subscription from Emil A. Lund, with no address attached. Mr. Lund is requested to send in his address, so that his subscription may be entered.

No. 1,028,200—Eldridge and Beebe spark plug.

1,030,347. Exhaust Silencer. Patented June 25, 1912, by Zachariah Swearingen, Osceola, Iowa. This is a silencer or muffler with a cylindrical body, flanged heads and partitions adjustable along rods which couple the parts together. The exhaust gases enter against the nose of the cone partition, are deflected around it and pass into the space between it and the straight central diaphragm. This latter is pierced with a rectangular central aperture and extends from wall to wall. The gases continue through the central aperture and pass over the arched surface of the third partition, which like the first, does not touch the walls. They then pass out through the tail pipe. The gases are thus broken up, and any tendency to move in the reverse direction is counteracted by the forms of the first and third partitions, which cause the gases to rebound and continue as before.

1,029,606. Valve mechanism for carbureters. Patented June 18, 1912, by W. S. Guthrie, Terrell, Tex. This consists of a lift valve somewhat on the order of those fitted to generator valves for gas engines, but differing in having a coned face working in a cylindrical opening. The lift or fluid valve works under the suction of the motor, rising as the suction increases and by its form giving increased opening around its periphery. It carries a spring and a needle-valve which acts to open or close the jet opening leading from the float chamber (not shown). The stem of this combined valve is controlled in its movement by a screw at the top of the mixing chamber casing. Means are provided in a shutter for regulating the primary air to the mixture.

1,030,135. Spark-plug. Patented June 18, 1912, by Belisario Silfa, New York, N. Y. This plug has the center electrode remov-

able for cleaning and adjusting, the whole central construction (insulating sleeve, core, electrode proper) being removable by slackening off a gland in the upper portion of the plug body. Cement is used to surround the electrode and the body has a cup or hollow to accumulate soot and the like and thus keep the electrodes clear.

1,032,245. Variable speed gearing for motorcycles. Patented July 9, 1912 by F. W. Smith, Redditch, England. In connection with this device the motor has two sprockets rigidly attached to its crankshaft, each sprocket driving a chain to one of the sprockets shown. These sprockets are loose on a countershaft which runs through the bracket shown, but are fitted with bands which can be expanded by fingers projecting within the hollow formed on the left hand extension of the countershaft. A thimble is operated by pinion and rack within this hollow and by its movement expands either band, coupling the particular sprocket and carrier to the countershaft and driving the road wheel by means of a chain working over the sprocket at the right or far end of the countershaft. An intermediate position gives the free engine, when both chain and sprockets run idle. The gear ratios are dependent on the diameters of the sprockets.

No. 1,029,606—Terrell carburetor mechanism.

FREMONT RACE MEET.

FREMONT, Ohio.—The Fremont M. C. will hold a race meet at the track of the Sandusky County Fair Association on August 18 when a number of well-known riders will compete. There will be both professional and amateur races. The races will be staged by representatives of the Interstate Racing Association.

MAY HOLD ROAD RACE.

WITH a view of reviving the Fédération Internationale des Moto-Cyclistes (F. I. M.), it is proposed to hold a road race in France in 1913 on the lines of the Tourist Trophy races held in the Isle of Man every year. The editor of L'Aero of Paris is the enthusiastic backer of this proposed contest.

WINS AT READING.

IN the twelve-mile motorcycle event held at Jeffersonville, Pa., in connection with the Norristown Driving Club's summer meet, Arthur Bruderreck, on an Indian, won in 15:39. Harry Becker, R-S, and Joe Grossman, Indian, pushed the winner hard, but took second and third place respectively at the finish.

No. 1,030,135—Silfa spark plug.

STEEPEST MOTORDROME IN THE UNITED STATES.

OUT of the sands of the sea, on the site of the old Galveston Flood Building at Coney Island, a new miniature motordrome has been built.

This track is unique in that it is the steepest and smallest ever constructed. The diameter of the bowl is 50 feet at the base, and the side slopes up at an angle of 72 degrees. The sides of the bowl are but 20 feet wide, and the diameter at the top is about 65 feet.

When the saucer was constructed, Mr. Curran, the owner, did not know what to do with the sand which was excavated, and finally he had it thrown behind the track. It proved to be a wise procedure, as the sand settled in behind the boards, making the track practically solid and vibrationless.

Mr. Curran for some time was unable to obtain riders who had the nerve to ride the track. He now has a corps of nery motorcyclists.

RUTLAND'S FIRST MEET.

RUTLAND, Vt.—The first in a series of motorcycle race meets to be held on the local fair grounds drew a large crowd of fans on July 25. The feature of the program was a five-mile handicap which was won by Edson, of this city. His time was 7:30. The first race was over the mile route. It was captured by Trudo, of Rutland, on an Indian. Stafford, also of this city, was second on a Harley-Davidson, and Hyde, of Poultny, on a Flying Merkel, was third. Owing to inter-city competition all the events proved interesting and the outlook is promising for future cards.

STOLEN MOTORCYCLE.

ATTENTION is called to the fact that a 4 h. Emblem motorcycle, carmine finish, numbered 4115, was stolen from the agent, Jerry Walling, of Saddle River, N. J.

No. 1,030,347—Swearingen muffler.

1,032,245—Smith variable speed.

QUESTIONS and ANSWERS

BELOW will be found the decisions on Question No. 2, the construction and functions of a spark-plug. The winner is Miss Emma Stone, of 1753 Hague avenue, Merriam Park, Minn., her answer best fulfilling the conditions of the contest. The second prize is awarded to P. F. Lindemann, 1487 Hoe avenue, Bronx, New York, while honorable mention is made of the answer by Roderick Drysdale, of Norwich, Mass.

The number of replies to the questions in this series increases with every new question, and it is much easier for the Editor of the Questions and Answers Department to make a choice if care is taken to give clear and complete answers and unnecessarily long letters are avoided. The answers to Question No. 4, given below, will be published in the September 19 issue.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the second issue following the number in which each question is asked. For example, answers to question Number 2, published in the July 27 issue, are printed in the present issue. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York."

Question No. 3. Describe the operation of a high-tension magneto.

Question No. 4. What is a fly wheel and what are its functions. Answers to Question No. 4 will be published in the September 19 issue.

FRANK

MERRITT

SPARK PLUG DEFINED.

IN answering Question No. 2, a number of writers assumed that the novice was familiar to too great an extent with the electrical equipment of a motorcycle, and hence some really good descriptions had to give place to those which more satisfactorily met the contest requirements. It must be considered that the answer is to enlighten the novice, and be a full statement in the simplest language and having the fewest words. The first prize of five dollars is awarded to Miss Emma Stone, of 1753 Hague avenue, Merriam Park, Minn., while the second prize of three dollars goes to P. F. Lindemann, 1487 Hoe avenue, Bronx, N. Y.

Miss Stone's description is as follows:

"The primary purpose of a spark plug as applied to the motorcycle engine is to cause an electrical spark inside the motor strong enough to ignite or explode the compressed charge of gas.

"This useful little instrument is made possible by that characteristic of an electrical current which causes it to jump to other nearby metal if it comes to the end of the wire upon which it is traveling. The plug must contain three primary parts: First, a center wire or terminal into which the high tension current is carried through a cable from a coil or magneto. Second, an insulating case of mica, porcelain or other non-conducting material must surround the center wire to guard the current and prevent it from jumping to other metal. Third, a substantial metallic outside shell or casing must surround the core and terminate in a point or part very close to the

internal unprotected end of the center wire. This allows the current to jump from the un-insulated point of the wire to the casing, causing the desired spark.

"These three parts are held firmly together by a locknut or other device while the outside casing is threaded to screw into the explosion chamber of an engine."

Mr. Lindemann's definition and description is as follows:

"In order to get a spark from the revolving armature winding of a high tension magneto a spark-gap of about 1-50 of an inch must be provided in the electric circuit of the magneto.

"This function is performed by a device called a spark plug.

"The spark plug consists of a cylindrical shell, into which is fitted perfectly air-tight an insulating mica or porcelain core, through the center of which extends a metal rod. One end of this rod is adapted to receive the magneto cable, while the other end terminates in a point preferably of platinum (whose melting point is 3,227 degs. F.). The shell is also provided with one or more points or electrodes pointing toward the center, and with a thread which screws into combustion chamber of cylinder. Between these points the spark occurs."

Roderick Drysdale, of Norwich, Mass., submitted the following answer, which is considered worthy of publication:

"The spark plug is a simple instrument for causing the spark to explode the gas-mixture in the cylinder of the motor.

"It is made in two parts, a shell and a core. The core fits into the shell, but is insulated

from it so that a connection is allowed only at the ends of the two wires. One wire is connected to the shell and one to the core, the ends being placed 1-32 of an inch apart, allowing the current to jump across, making the spark.

"The spark plug screws into the cylinder either at the top or side of the explosion chamber and can be taken out for cleaning or replacement."

THREE-SPEED HUBS.

H. F. DRAKE.—The Armstrong hub is made by the Armstrong Three-Speed Gear Works, Icknield street, Birmingham, England. The Sturmey-Archer hub is made by the Sturmey-Archer Gears, Limited, Nottingham, England. They are made in sizes up to 4 horsepower machines, and are usually fitted to $2\frac{3}{4}$, 3 or $3\frac{1}{2}$ horsepower mount. They are not at present made for higher powered machines. No American agencies have been established.

MOTOR TYPES.

GEORGE DOUGLAS.—The opposed motor has its cylinders in the same horizontal plane but slightly offset so that two cranks at 180 degs. apart can be fitted. The explosions occur at 0 degs. (number 1 cylinder) and 360 degs. (number 2 cylinder) followed by another 360 degs. before number 1 fires again. The running balance is thus very fine and a motor of this type can be run free up to a high speed before vibrations are felt. There are no motorcycles using this type as yet in this country, but the English Douglas ($2\frac{3}{4}$ h.)

and Williamson (8 h.) are the best known European models.

The 45 deg. twin has the cylinder axes 45 degs. apart, while the firing sequence is: Number 1 cylinder, 0 degs.; number 2 cylinder, 405 degs. Number 1 fires again 315 degs. after number 2. There is considerable vibration in this form, but it is very speedy as far as revolutions per minute are concerned and fits into any frame. It is thus used much more than the better balanced opposed type. The same may be said of the 42 deg. and 50 deg. types.

SMALL STORAGE BATTERIES.

RALPH H. LEFFLER.—Small electric storage batteries are only made by a few firms. Write the Geiszler Bros. Storage Battery Co., 514 West Fifty-seventh street, New York; Philadelphia Storage Battery Co., Ontario street, Philadelphia; Witherbee Igniter Co., Springfield, Mass.; Electrolamp Battery & Ignition Co., 67 Atwater street, Detroit, Mich.

FIFTEEN HUNDRED-MILE TOUR.

GEORGE EDER, a Reading real estate dealer, and George Snyder, a salesman for the National Biscuit Company, left the motorcycle establishment of William Buel, Reading, Pa., on August 10 for a 1,500-mile trip. St. Louis is the objective point, with Pittsburgh, Wheeling and Cincinnati as the principal stopping places en route. The return trip will be made over the same course. The machine used is a twin cylinder Harley-Davidson.

LONG TRIP FOR SHULTZ.

WM. SHULTZ, of Coleta, Ill., returned August 10 from a 34 days' trip through the Middle West on a motorcycle, consisting of about 2,000 miles altogether. He visited at Cedar Rapids, Waterloo and Fort Dodge, Pierre and Aberdeen, S. D., St. Paul and Minneapolis, Minn. He also spent a week at the Cheyenne Indian Reservation in South Dakota.

Wm. Bewley, a former racer and road man, who is head tester of the Flying Merkel forces.

SIDE-CAR BODIES.

WE should be glad to have the addresses of firms who make side-car bodies to order, singly or in quantity. Inquiries are chiefly about wicker or art-cane bodies.

THE riders of Sunny France are to have a chance to show their ability in an endurance run, August 25, at Fontainebleau, near Paris.

STURDY THOR OUTFIT.

A. FAGERHOLM, foreman of the assembling department at the Thor factory, appears on the machine in the accompanying photograph and his wife occupies the side-car. The machine is a Thor 7, husky enough to take the outfit

over almost any kind of roads, and the passenger attachment is of special design, as comfortable as it is attractive in appearance.

USED IN SPELL-BINDING.

FL. VALIANT, of the Miami Cycle & Manufacturing Co., writes: "My 1913 Majestic side-car and Flying Merkel motorcycle have proved a big boom for the suffrage movement in this country. A few days ago

Miss Louise Hall, who is traveling through Ohio and some of the Southern States in the interests of the suffrage party, came to the plant of the Miami Cycle & Manufacturing Co. to make a speech. She did not have a soap box handy so it was suggested that she make a speech from the side car, which she did. Some of the visiting riders at the plant formed an able bodyguard for her, and during the noon hour she addressed the employees of the plant.

SIDE-CAR ENTHUSIASTS.

HEREWITH are shown 'Gene Coughlin and his fiancée, Miss May Roy, who are enthusiastic New York devotees of the side-car. The paved boulevards of the

metropolis hold little interest for them, and week-ends they can generally be seen exploring the roads in Westchester and neighboring counties with the Merkel and Baxter outfit. Coughlin is the manager of the Riverside Motorcycle Garage, recently opened at 533 West One Hundred and tenth street.

MOTORCYCLES have been ordered by the Forestry Department of Pennsylvania for the use of rangers on the reserves and stations of that State.

TOURING

PORTSMOUTH, VA., TO DETROIT.

A. L. CHASE.—Take route 89 reversed from Portsmouth to Richmond and from Richmond go to Washington, D. C., use route 98 reversed. To Baltimore from Washington take route as follows: Route 96 to Hagerstown, then route 76 reversed to Baltimore or, take route 79, Washington to Baltimore via Colesville (latter half).

From Baltimore take route 77 to Gettysburg, Pa. From Gettysburg take route 53 to Bedford Springs. Go next to Cumberland, Md., a distance of 28 miles over easily followed road. From Cumberland follow route 99 to Pittsburgh, Pa.

From Pittsburgh take route 146 to Columbus, Ohio.; then route 137, Columbus to Toledo. From Toledo go to Detroit via route 111 reversed. Return trip, take route 111 ahead to Toledo, then route 103 reversed, Toledo to Cleveland. From Cleveland take tour 138 reversed to Erie, Pa. Next go along route 29 reversed to Buffalo. From Buffalo, take route 47 reversed to Syracuse, N. Y. For a nice scenic route take number 48 from Syracuse to Watkins Glen, and follow number 68 reversed to Scranton, Pa. From Scranton go to Delaware Water Gap via: 2.2 Gouldsboro; 27.8 Tobyhanna; 32.8 Mt. Pocono; 43.8 Analomink; 49.0 Stroudsburg; 52.7 Water Gap. From Delaware Water Gap take route 35 beginning at Water Gap (98.1 miles).

Follow route 38 as far as Trenton, where go on to Philadelphia via 0.0 Trenton; 9.4 Langhorne; 13.8 La Trappe; 18.9 Bustleton; 26.1 Ogontz; and 35.0 Philadelphia, Penn square. From Philadelphia take route 61 to Gettysburg, and from Gettysburg to Baltimore route 77 reversed. Take first part of route 79, Baltimore to Washington. Take next route 98 to Richmond and 89 Richmond to Portsmouth.

To reverse a route, proceed as follows: On route 98 read Norfolk as 0.0 miles; then West Branch will be 119.6—117.0 plus 2.6 miles; Hodges Ferry will be 6.8 miles, etc.

TO LOS ANGELES.

C. E. PARKER.—Follow old National Road to Columbus, then route 133 (Touring Number) to Springfield; then route 134 to Indianapolis. From Indianapolis take number 214 to Terre Haute and number 241 reversed to St. Louis, Mo. From St. Louis go next to Mexico, Mo., taking route 239; then, following route 230 reversed, go to Kansas City, Kan.

From Kansas City go to Emporia as per route 277. From Emporia go to Plymouth, Saffordville, Cottonwood Falls, Strong, Elm-dale, Clements, Florence, Peabody, Walton, Newton, Halstead, Burrton, and Hutchinson. Take route 226 next to Dodge City, and follow this by route 224, Dodge City to Lamar, Col. From Lamar go to Pueblo, by route

255, taking route 265 to Denver via Colorado Springs.

From Denver take next route 248 to Laramie, Wyo., then 262 from Laramie to Rawlins. From Rawlins take route 266 to Rock Springs. From Rock Springs take route 268 to Evanston, Wyo.

From Evanston go over to Ogden, Utah, and continue on to Kelton via route 250 and 251. Follow route 257 to Cobre, Nev., from Kelton. From Cobre go to Cherry Run, then to Ely, a considerably long run over poor desert roads. From Ely, go to Lida, Nev., over route 249. From Lida follow route 277 reversed to Los Angeles.

SOMERVILLE, N. J., TO TAMPA.

ELLESWORTH D. OPIE.—From Somerville go to Trenton via Harlingen, Kingston, and Princeton, a distance of 29.8 miles over good roads. From Trenton go to Philadelphia via Langhorne, La Trappe, Bustleton and Ogontz. From Philadelphia go to Baltimore via routes 61 as far as Abbottstown and 77 reversed from Abbottstown. From Baltimore go to Winchester, Va., via route 80.

From Winchester follow route 84 to Staunton; then route 93, Staunton to Roanoke. From Roanoke take tour number 88 to Winston-Salem, N. C. Take route 100 next, Winston-Salem to Charlotte. Go over route 324 next to reach Columbia, S. C. From Columbia go on to Augusta, Ga., over route 325. From Augusta go to Savannah via route 335 reversed. Route 326 will now take you to Jacksonville, Fla.

For route Jacksonville to Tampa, follow number 329. Numbers refer to routes in our Spring Touring Number.

TO RURAL RETREAT, VA.

S. F. GRUBB.—Oklahoma is not road-mapped, so we can only give a few directions. Strike across from Claremore to Tulsa, then to Sapulpa, Kellyville, Heyburn, Bristow, Depew, Stroud, Davenport, Chand-

ler, Gow, Warwick, Wellston, Luther, Jones, Munger, Spencer, and Greig to Oklahoma City. You follow the line of the St. Louis & San Francisco R. R. and pass through Tulsa, Creek, Lincoln, Oklahoma counties.

From Oklahoma City take route 245 reversed to Wichita, Kan. Follow route 244 next to Emporia; then take route 227 reversed, Emporia to Kansas City, Kan. From Kansas City take route 230 to Mexico, Mo., and follow this by route 239 reversed to St. Louis, Mo. From St. Louis go next to Terre Haute go to Indianapolis via route 214 reversed.

Leaving Indianapolis, follow route 134 reversed to Columbus, O. From Columbus take route 146 reversed to Pittsburgh, Pa. From the latter city take number 148 to Hagerstown, Md. From Hagerstown go to Staunton, Va., via route 84. From Staunton go to Roanoke, via route 93. From Roanoke follow the Washington Highway through Salem, Elliston, Christiansburg, Newbern, Max Meadows, Wytheville and Crockett to Rural Retreat. The numbers refer to the routes in our Touring Number.

PASSAIC TO LACKAWAXEN, PA.

A. DOLPH KANT.—Go from Passaic to Paterson. From Paterson go to Pompton, then to New Foundland, Hope-well, Sparta, Ackerson, Branchville, Lay-ton, Dingmans Ferry, Riverside, Bushkill, Echo Valley, Shawnee, and Delaware Water Gap, 78.4 miles—macadam roads mostly.

From the Gap go to Port Jervis via Stroudsburg, Marshall Creek, Echo Lake, Bushkill and Milford; go to Matamoras and Port Jervis. From Port Jervis go next to Honesville, then to Mongaup, Pond Eddy, Barryville (cross Delaware), and finally Lackawaxen. Roads good, Port Jervis to Lackawaxen, distance, 22 miles.

PAW PAW LAKE.

B. A. MURRAY.—Paw Paw Lake is in Berrien County, near Coloma. Coloma is 10½ miles to Benton Harbor and about 13½ miles from St. Joseph. Road to Benton Harbor is good. Kalamazoo is 39½ miles to the east of the lake and is a large manufacturing town. At Benton Harbor you are on Lake Michigan and in direct communication with Chicago by water or land. Paw Paw Lake is very picturesque, but the places of interest are few, and local details should be obtained from the passenger agents of the Pere Marquette R. R. or the Kalamazoo, Lake Shore & Chicago R. R.

THROUGH CHEYENNE CANYON.

THROUGH Cheyenne canyon on his motorcycle with the ease of a Pullman train—that's the accomplishment of C. G. Martin, of Wichita, Kan., who recently completed a 525-mile motorcycle trip to Colorado Springs and return. He made the journey in twenty-one hours.

B. M. Anderson, after 2,500-mile Trip from Salt Lake City to Yellowstone Park on a Flying Merkel.

FROM ANGOLA (IND.) TO NIAGARA FALLS.

J. W. CLEM.—From Angola go south to Waterloo via Pleasant Lake, Steubenville and Summit. The roads are good dirt and clay and the distance is 16 miles. From Waterloo strike east through Butler, Bryan (O), Stryker, Archbold, Wauseon, Delta, Holland and Toledo. The roads are good, the distance being 84 miles. From Toledo go next to Stony Ridge, then to Lemoyne, Woodville, Hessville, Fremont, Clyde, Bellevue, Sandusky, Huron, Vermillion, Oak Point, Lorain, Lake Breeze Beach Park, Avon Lake, and Rocky River into Cleveland. Travel is over macadam and gravel roads, the distance being 125.9 miles.

From Cleveland go to Euclid, Wickliffe, Mentor, Painesville, Perry, Madison, Unionville, Geneva, Ashtabula, Kingsville, Conneaut (Ohio), West Springfield (Pa.), Girard, Erie, Wesleyville, Northeast (Pa.), Westfield (N. Y.), Brocton, Fredonia, Silver Creek, Irving, Evans and Buffalo. The distance from Cleveland to Buffalo is 191.7 miles and the roads are good gravel to Erie and gravel with some clay, Erie to Buffalo.

Niagara Falls is 21.6 miles from Buffalo and the route is through Tonawanda, North Tonawanda, Gratwick Station, La Salle Station. The roads parallel the Niagara river and are fair-to-poor dirt.

STATEN ISLAND TO JAMAICA, L. I.

B. F. BRYANT.—From the Bay Ridge avenue ferry go on to Fort Hamilton Parkway, and continue along the Parkway (to the left) past the intersection with Ocean Parkway to Prospect Park entrance. Go through Prospect Park heading for the Plaza (Memorial Arch, Eastern Parkway and Flatbush avenue). At Plaza turn right and follow Eastern Parkway to end, where turn right into Bushwick avenue. Follow Bushwick avenue to Evergreen Cemetery and turn left into Highland Boulevard. Continue along this route, going into Jamaica avenue. Follow Jamaica avenue to Shaw Parkway, where turn left and continue until Forest Park Turnpike is reached. Go right into Turnpike and follow to intersection with Hoffman Boulevard, where turn right and ride to intersection with Hillside avenue. Ride along Hillside avenue. Take Merrick road from Hillside avenue (Jamaica).

WICHITANS CAN RIDE DOUBLE.

WICHITA riders can carry a passenger on a motorcycle built for one only, as the ordinance prohibiting the practice has been repealed. A new ordinance is proposed prohibiting passenger-carrying on Douglas avenue between Water and St. Francis streets, and on Main street, between First and William streets. Thus if either of these streets is to be crossed, the passenger must alight and cross on foot. The new bill is the outcome of efforts of the Wichita M. C. to have the old ordinance repealed entirely.

FINISHED FORTNIGHT'S TOUR.

EDWARD LANGLEY and Robert Turnbull finished a two weeks' tour from Manchester, N. H., on August 8. The route was through Peterborough, Keene, Rutland, and Burlington, Vt. Turnbull took a side trip to Canada but rejoined his companion at Burlington, when both returned to Manchester.

Miss Lillian Hauerwas, Who Recently Made Round Trip Between Chicago and Milwaukee.

ROUGH ROUND TRIP.

MISS LILLIAN HAUERWAS has the unique distinction of being the first lady rider who negotiated the rough roads between Chicago and Milwaukee successfully. Accompanied by Roy Bowser, Miss Hauerwas made the round trip on her Harley-Davidson recently, and encountered practically a continuous series of roads of which the term "poor" gives but an inadequate description. This was the case especially south of Milwaukee and Kenosha; near the latter city, the farmers having apparently clubbed together and "worked out" the roads, with the result of having lumps all over and these covered with loose stones. On one stretch in particular there was no side-path and Miss Hauerwas rode it without trouble.

The stretch in the photograph is a specimen of the sandy surfaces encountered, but does not show the worst parts of the trip. Although no attempt was made to establish a record, the pair made the out-trip to Chicago in 4 hours and 50 minutes, and the next day returned to Milwaukee in 4 hours and 25 minutes. The fair rider traversed the roads without having her ardor dampened in any manner, and while in Chicago took a number of side trips, so that her total mileage was 255 when she reached Milwaukee again.

Road and Natural Beauties Near Tacoma, Wash.

POSTING CANADIAN ROADS.

THE Ontario Motor League has sent out two pathfinders to post up a number of Ontario's highways and to report on the condition of roads. Both "scouts" are motorcyclists, being members of the Toronto Motorcycle Club. They are Dan Davis, Indian, and Walter Stoner, Triumph. They have been covering 100 miles a day.

TO RIDE TO NATCHEZ.

ROBERT ELDRIDGE, a deaf mute printer, with his bride, left Rome, N. Y., on August 9 to ride to Natchez, Miss., where the couple will make their future home. The route taken is 1,600 miles in length. The groom will be associated with the News Publishing Company, of Natchez, subsequent to his arrival.

TEN-MILE SPEED LIMIT.

An ordinance limiting the speed of motor vehicles to ten miles per hour has just been passed in Medford, Okla. Fines of from five to twenty-five dollars plus costs will be inflicted for violation of this ordinance.

BAKER BREAKS RECORD.

E. G. BAKER, of Indianapolis, lowered the record for the half-mile dirt track at Dayton, Ohio, on August 10, his time being 1:12½ for the mile. This creates a new record, the former one being made by Don Klark, of Columbus. Baker's figures are expected by local authorities to stand for some time to come, as the track is a hard one to ride. In addition to the time trial, Baker took first in the ten-mile free-for-all, and second in the five and ten-mile open events.

USING GARGOYLE OIL.

Announcement is made that Gargoyle Mobiloil "B" is being used for the racing machines at the Brighton Motor-drome, and that it is giving entirely satisfactory results under the unusually trying conditions which prevail on the big bowl.

AN ALBUQUERQUE PROGRAM.

MOTORCYCLISTS and dealers in Albuquerque, N. M., have made arrangements for a race meet to be held on September 2, at Traction Park. A card of fifteen events will be presented, ranging from one to fifteen miles.

H. J. DE TURK, formerly of Reading, Pa., but now of Los Angeles, finished a two weeks' trip from St. Louis to Los Angeles, arriving on August 1.

FROM THE CANADIAN VIEWPOINT

Dominion Officials and Riders Studied F. A. M. Convention Methods and Carried Home Many Pointers For Their National Organization.

DURING all the hip-hip-hurrah of the F. A. M. national assembly and championships at Columbus, Ohio, last month, a delegation of a score or more of Canadian motorcycle men, including a dozen riders, all associated with the recently-organized Canadian Motorcyclists' Association, were quietly and intently making notes of everything they saw for the express purpose of developing their own Dominion organization. These prime boosters of the organized sport in Canada had seized the opportunity to perfect their own highly prized body and judging by the tales that are now being told on the Maple Leaf side of the border, good work was made of the mission.

The F. A. M., as seen through Canadian goggles, appeared more mighty than ever, following the experience of the Columbus meeting. The Canuck rider rubbed shoulders with the Californian, shook the hand of the Floridan and conversed with the New Englander—and all were F. A. M. boosters. Surely the Federation was an organization, a part of which any rider should feel proud to be.

Practically strangers to the organized motorcycling sport, the Dominion delegation took home with them many valuable pointers. Incidentally the "foreigners" enjoyed their "big week" at Columbus, even while they were conducting their missionary work. Several of the officers of the C. M. A. made it a point to meet the big manufacturers in order to advertise the existence of the Canadian Association and to prove that motorcycling is being placed on a high plane in the Land of Snows.

The effect of holding a big "National Carnival" was strikingly proved to the Northerners during their stay in the Ohio Capital. Much publicity for the sport was gained along the routes of the four National tours and reports of the Assembly were published generally. The present members of the Federation were shown that the body was very active and alive to the situation and many new members will now be induced to join. The manufacturer and the rider also got closer together.

Ten of the Canadians rode to Columbus in the Northeastern tour, joining in at Buffalo. These riders got stuck on American highways, especially those of Southern Ohio, in every sense of the word. Frankly, the Canucks looked for a highly-developed system of public thoroughfares and were sorely disappointed. It is needless to say that every member who took part in the Northeastern tour anyway became an ardent

supporter of the Good Roads' movement, as a result of this experience.

One criticism was forthcoming for the management of the tours, and this was aroused over the neglect of the Federation officials to make better preparations for the trip. No pathfinders were sent out to discover the best routes and the path of the tours were not posted to aid the stragglers in keeping on the right roads. Many of the latter lost their way completely on a number of occasions because the routes were not marked. The official printed schedules were also far from correct, the times allowed being impossible and the distances too short. The more experienced riders hit up far too fast a pace for the beginners, in attempting to live up to the time-tables.

The Canadian "Flying Squadron" did not exactly appreciate the method of holding "stump court" as practiced by county and town constables of Ohio. In several instances, riders were nabbed for really minor offences and were relieved of good cash by the officers of the law on the spot in real "highway" fashion. "Why, he wouldn't even give me a receipt for my good money," was the way one offender expressed himself after undergoing a constable ordeal.

"One thing has been impressed upon me since going to Columbus," declared Mr. K. R. Spencer, of Hamilton, president of the C. M. A., "and that is, that the manufacturers have got to pay a great deal more attention to the Canadian Association in future. I refer, particularly, to the Canadian manufacturers, who have been doing practically nothing for us. With affiliated clubs located from Montreal in the East to Winnipeg in the West, we are getting to be a factor in motorcycling circles. Look how the big United States manufacturers helped to make the F. A. M. convention a success; look at the way they lavished souvenirs upon the delegates; look at the great, big time everybody had together. It is up to the producers to treat the Canadian Association better in future."

"Before I went to Columbus, I was interested in a scheme to erect a board track at Hamilton," Mr. Spencer went on, "but after my first experience in board track racing I have changed my opinion. The board bowl is capable of allowing a tremendous speed, but otherwise riding on the dirt is more spectacular in my mind." Other members of the Canadian delegation are of the same opinion as their leader.

The Canadian visitors who were present at the Federation gathering included K. R.

Spencer, of Hamilton, president of the C. M. A.; F. A. O. Johnston, president of the Toronto club; Nelson Chambers, of Hamilton, and H. M. Kipp and wife, of Toronto, both of the trade; Mr. McCutcheon, of the London, Ontario, club; T. I. Anderson, secretary of the C. M. A., and R. M. Jaffray, of Montreal.

E. R. JENKINS,
F. A. M. Commissioner for Iowa.

NEW AFFILIATIONS.

THE latest club affiliations: Michigan City (Ind.) Motorcycle Club; J. E. Edsall, secretary, 12 members; Champaign Motorcycle Club, Champaign County, Ohio; secretary, F. A. Harenburg, 22 members, 100 per cent.; Victoria Motorcycle Club, Victoria, B. C.; L. W. Lillie, secretary, 21 members, 100 per cent.

ANOTHER REWARD PAID.

SECRETARY G. B. GIBSON has just paid the seventh reward offered by the F. A. M. for the recovery of a motorcycle stolen from a member of the Federation. This time the reward of \$25 went to Police Officer L. J. Wonderly, of Topeka, Kan., who discovered the thief and stolen motorcycle of a F. A. M. member, Dr. C. M. Hensley.

This plan of awarding \$25 to the person recovering a stolen motorcycle of a F. A. M. member was inaugurated some time ago by the Federation in its efforts to promote the interests of motorcyclists. Since that time seven machines have been recovered and several of the thieves have been sentenced to serve long terms behind the bars.

MUD-PLUGGING IN CANADA

Calgary Riders Have a Rather Harrowing Experience With Alberta Roads.

ON Saturday, August 3, five of us started from Calgary for a point on the Ghost river about fifty miles from town, where the fishing was reported to be good. We carried blankets, grub, our trusty .44's and our fishing tackle, intending to make camp at our destination a few hours after our start, which was at 3 p. m. About fifteen miles out of town we saw a dark cloud approaching, and as we had any number of roads to take, my partner and I turned off, and the others went straight on, they intending to meet us at Cochrane, a town about twenty-five miles from Calgary. It so happened that we went around that cloud, and they went under it. We ran into a little rain, but not enough to even wet the belts. We got into Cochrane, repaired a puncture, docked the machines at a garage and went to the main hotel, where we had our "ham and."

After about an hour and a half we heard a "putt-putt-putt" outside and there was one of our party. He was, to say the least, WET. Everything he had with him, even his tobacco, was soaked. Another half hour and the other two came up, with mudguards tied onto their handlebars. It goes without saying that they, too, were wet. The next morning my partner and I went out, but nothing in the way of three dried-out motorcyclists and machines could be found, so we went on towards Ghost river. After we had gone about eight miles we ran into a heavy shower, so we turned around and went back to Cochrane. By the trail we could see that no motorcycles had gone along the road we were traversing in the last day or so. Arriving at Cochrane we met two other motorcyclists from Calgary who had come out that morning. As it looked like "some" rain, we had made up our minds to go back, but now that there were four of us, nothing would satisfy one of the boys (who, by the way, is an excellent cook) but that we have a chicken dinner. We did not know whether the other three had gone back to town the night before or not, and what is more, we did not care. We found the butcher's residence, got two nice chickens, some butter, bread, potatoes, salt, etc., and then made our way to a dump heap about a mile out of town. There were all kinds of tins, gasoline cans and sticks of wood, so we went to the river and found a nice place under the bridge where we scoured out our "china" and proceeded to get busy. Such a dinner! About eight courses. We started out with some fruit cakes, went on down through the spud and chicken course to strawberry jam on toast. Our courses may not have been in the order that society calls for, and as we only had one knife and fork, our manners would have shocked some of our stylish friends, but we were hungry, and that ends the argument.

About 4 p. m. we started for Calgary, making "haste" in a way that made the dust fly. We had gone about five miles when we ran into a heavy shower. That stopped proceedings for a while. I had a new flat belt, which was tight, to say the least, and it was necessary for me to open the machine out wide in the stand and then let her down in the mud and hop on. My partner and I made about a mile and a half in an hour; he could have made more, as he had a two-speed machine, but he stuck by me, and the other two went

on. The roads are all right here when they are dry, but when they are wet, give me an airship. After a couple of hours the roads were half-way decent, except in spots, and so, after cutting down a few fences and riding in the fields a while, we were able to hit the main road again.

Then came another rain storm, which made the machines worse than useless. We left them and walked about a quarter of a mile to a farm house, where we learned that our other two friends had gone through some time before. After gulping down eight glasses of milk, a little well water and a little slough water, we went down and got the machines, put them in a shed and began to think of what a nice place home was after all. Darkness was falling, and thirteen miles from home. It so happened that the farm house we stopped at was a rural telephone exchange, and as everybody knows everybody else's business, our hostess told us that there was a five-passenger Ford about three miles out the road we had come, which had been there all the afternoon on account of a blow-out, and that a seven-passenger Chalmers was at that moment on its way to the assistance of the Ford. We waited until the Chalmers came along, hopped in and "fixed" the driver with a couple of cart-wheels each, and then directed them to the Ford, as they were apparently lost. The tire was soon fixed and both cars started through the mud. The Chalmers had two oil lamps and the Ford had one oil lamp, and the night was very black, but that didn't seem to worry the drivers. That was the worst ride I ever expect to take. We banged over bridges, around curves, through puddles of water at a speed of about 25 miles per hour, and only twenty feet behind the other car. I felt inclined to say something to my partner in a loud aside about reckless driving, but thought better of it, and trusted to luck and the mohair top to keep us from getting thrown out. At about 2 a. m. we reached town and then proceeded to clean up everything in sight at a nearby restaurant. As the street cars do not run after midnight, it was a little walk of two miles to my house, and then only four hours of peaceful slumber until the alarm clock said something about getting up.

The rest of our party, we found later, had got about three miles closer into town than we had, and then the rain storm, which had been our Waterloo, overtook them and they shoved the machines in another farmhouse. At the farmhouse they met two of the three that got lost, the third having gone home in the morning. The four of them got a rig and drove in, arriving in town about 11 p. m.

Now I am not a pessimist, but I don't call that fun, especially when a 200-pound machine with 50 pounds of baggage has to be pushed several miles through mud. Still, if it was to be done over again, I might—, but no use saying it, all the boys would do the same thing if they were in our places. However, next time we will have weather reports from north, south, east and west for about forty-eight hours ahead before we attempt any more "joy-runs."

L. M.

IN DELAWARE.

THE Wilmington Motorcycle Club is constantly increasing in membership and many long reliability runs are planned for the balance of the season. The club recently held a run to Augustine Beach, N. J.

F. A. M. BUDGET

Made Up By Directors At a Meeting in Detroit and Submitted to President.

THERE was a meeting of the Board of Directors of the F. A. M. at Detroit during the week of the Cycle Trades Convention.

G. H. Hamilton presided and J. Leo Sauer acted as secretary. There were also present Directors French, Willis and Thornley, or five in all, constituting a quorum.

Although, under the circumstances, the directors would have been justified in taking final action on all matters coming before the meeting, they decided simply to voice their wishes in the form of recommendations to the president, said recommendations to be sent out to all the directors for their approval. These recommendations follow:

That the organization set aside for the expenses of the office of the chairman of the Competition Committee, including rent, heat, light and stenographic services, the sum of \$2,750 for the fiscal year 1912-13, to date from July 15, 1912. The payment of this sum is contingent upon its being taken out of the receipts of Chairman Thornley's office.

The board voted to increase the allowance to Secretary-Treasurer Gibson from \$1,000 to \$1,200, and that of Mrs. Minnie Gibson from \$520 to \$600 per annum, effective July 15, 1912.

The board favored Secretary-Treasurer Gibson's suggestion to enter into a one-year lease for office facilities in Westboro, with the privilege of renewing for two years more, in one-year terms, the rental to be \$200 per annum. The board also favors the purchase, by the secretary-treasurer, of a fire-proof cabinet instead of a safe, the cost not to exceed \$100.

The directors went on record as favoring an allowance of \$520 a year to the president for stenographic services.

The board recommends the appointment of Mr. J. H. Donehue, of New York, to manage the newly-established Touring Bureau.

NEW SHOPS REGISTERED.

TO the ranks of the F. A. M., Registered Shops, the following are added, according to advices from Westboro, Mass.: The Motorcyclery (W. H. Schmidt), 131 Main st., Chico, Cal.; Ralph M. Leonard, 214 W. Main st., Somerville, N. J.; Clinton E. Peiffer, Covington, Ohio; Charles E. Farr, Canastota, N. Y.; Stricker & Son (Grant Stricker), Laura, O.; Hall Cycle & Plating Co. (Lawrence Hall), 417 Franklin st., Waco, Tex.; Our Bike Shop, C. E. Kern-L. N. Tussing, 124 W. Cortland st., Jackson, Mich.; Anton M. Jorstad, Fergus Falls, Otter Tail, Minn.; Belmar Cycle Exchange (W. H. Reynolds), 1106 F st., Belmar, N. J.

AUGUST AFFILIATIONS.

NATIONAL SECRETARY GIBSON announces the following affiliated clubs for the month of August: Jerome—Jerome, Ariz., M. H. Hawkins, Jerome, Ariz.; Chico—Chico, Cal., Harry Bertholf, 78 Sixth st.; Waco—Waco, Texas, Lawrence Hall, 2700 Sanger st.; Park Region—Fergus Falls, Minn., Harry K. Bergerud; Black Hills—Lead and Deadwood, S. D., P. D. Shoenberger, 766 Main st., Deadwood; Pensacola—Pensacola, Fla., L. W. Wells, Y. M. C. A.; Morrow Co.—Mt. Gilead, Ohio, H. R. Crock.

AMONG THE CLUBS

PEORIA OFFICERS.

THE Peoria (Ill.) M. C. at its last meeting elected the following officers: William Voss, re-elected president; Richard Barbour, secretary-treasurer; Mark Olsen, press agent and Harry Reese, captain of tours. The club will hold its fourth annual race meet on Labor Day.

BIG TIME IN 'FRISCO.

CHIEF HOPKINS will entertain Indian riders at an Indian Pow-Wow at Fernbrook Parks, San Francisco, September 8. According to the announcement issued recently, the pow-wow will include music, dancing, a feed, prizes, in fact, a good time all day. All Indian riders are invited.

ANOTHER IN FLORIDA.

PENSACOLA (Fla.) riders organized recently, electing the following officers: President, Dudley C. Barrow; vice-president, Philip M. Yonge; secretary-treasurer, L. W. Wells; captain, E. C. Hinman.

THE Flower City Motorcycle Club, of Rochester, N. Y., held its first picnic of the season at Avon on Sunday, July 28. Athletic games featured the program.

WILLIAM ALLEN, a member of the New Jersey M. C., of Newark, N. J., is on a vacation trip by motorcycle through New York State.

Marion, Ind., claims over one hundred motorcyclists.

HOLD ANNUAL REUNION

1,500 Enthusiasts Gather at Transbay Course in California.

LIVERMORE, Cal., August 4.—With an attendance of 1,500 motorcyclists, the second annual reunion of the Associated Motorcycle Clubs of Central California was held here today. Races, games, dancing and a barbecue were the diversions of the day provided by the committee of arrangements, of which I. W. Story was chairman.

Two races were held on the seventeen-mile course, which extends from Livermore to Santa Rita and Pleasanton and back to this city.

Riders were present from San Francisco, Oakland, Alameda, San Jose, Stockton, Sacramento and other points about the bay. The races were opened with a big motorcycle parade at 1 o'clock this afternoon. After the races were finished a barbecue was served in the I. D. E. S. park, and a dance closed the festivities this evening. The local committee was composed of J. O. McKown, E. W. D'Ombra, W. Schaefer and George Beck.

CHICAGO CLUB GIVES DANCE.

THE Chicago M. C. gave an entertainment and dance to members and friends Saturday evening, August 10, at the clubhouse. The affair was largely attended and everyone enjoyed a most delightful evening. The clubhouse was beautifully decorated for the occasion.

UNIQUE TOURING CLUB.

H. S. HODGKINSON, an Indian sub-agent of Toronto, has formed a very original club for the benefit of motorcyclists who desire to go on short trips. The organization is known as the Riverside Touring Boys, and several invitation tours have already been held. The rules governing these trips include the following:

Riders must not forget that gentlemanly conduct is absolutely necessary.

Members will start in pairs, each man wearing a number. The low numbers start first, and a high number cannot pass a low number.

When a turn is made, or an obstruction is met with, one of the leading pair must stop to warn the following riders.

Pairs are asked to ride at least a quarter of a mile apart. Disregard of captain's instructions cancels all privileges.

The promoter of the club always brings up the rear and stops to aid a rider in trouble. A charge of \$1 is made for every trip, to provide for hotel accommodations.

O. F. M'LAIN PRESIDENT.

INDIANAPOLIS, August 19.—O. F. McLain has been elected president of the newly-organized Indianapolis M. C. An enthusiastic meeting was held in Morrison Hall and there were twenty-six riders in attendance. The dues were set at 50 cents a month.

John Merz was elected vice-president. Charles Wyatt defeated John Kinney for treasurer job, and Robert Sturm was chosen secretary. The following tradesmen were put on the board of directors: G. H. Westing, Gus Habich, John Kinney, W. A. Harding and F. I. Willis.

Although only twenty-six riders joined at the initial meeting, John Kinney is authority for the statement that 300 riders signed the petitions for a club, and that the membership is expected to pass the one hundred mark very soon.

NOW ABERDEEN CLUB.

AT a meeting of the Dakota M. C. on August 12, in the Bushnell building, Aberdeen, S. D., the club was reorganized and is now the Aberdeen M. C. The old by-laws were altered to fit the requirements of the new organization and plans for runs laid out. The club is to affiliate with the F. A. M. in the near future. Following are the officers: President, Kirk Roberts; vice-president, Walter Harrison; secretary, E. P. Neill; treasurer, Arthur Cole; captain, Oscar Olson; first lieutenant G. E. Petrick; second lieutenant, V. C. Blanchard. Edward Knee and P. N. Bushnell were elected on the executive committee with the officers chosen.

ON A CLUB OUTING.

IN the accompanying photograph appear Walter Dreher and wife and R. L. Hinds and wife, of Toledo, Ohio, who participated in a run held by the Yale M. C.,

of Toledo, on June 23. The picture was taken just after the arrival of the tandem outfits in Mansfield, the turning point for the club run. Mr. and Mrs. Hinds appear with their machine in the foreground.

“I Have Ridden my 1910 Harley-Davidson 20,609 Miles and it is in A1 Condition Today.”

**J. N. HOWE, Supt.,
Electrical Department,
Northern Indiana Gas & Electric Co.**

No motorcycle in which quality and service are only secondary considerations could render service like that.

Thousands of Harley-Davidson riders have received the same satisfaction as Mr. Howe and many could write testimonials even stronger than his.

Good material and careful work cost more than cheap material and indifferent work, but neglect either one of these and the owner is the one who will really pay for it.

Correct design coupled with the right material and careful workmanship have made the Harley-Davidson's reputation.

“COSTS MORE, BUT WORTH IT”

Harley-Davidson Motor Company

260 C Street

Milwaukee, Wisconsin

DEALERS

GOVERNMENT SALE.

ALEXANDER KLEIN, No. 2204 North Broad street, local representative for the Harley-Davidson Company, has recently been awarded a contract by the United States Government to furnish the motorcycles for the coal inspectors at the League Island Navy Yard, Philadelphia. Mr. Klein reports business to be in a very healthy condition, and indications are that it will continue until late in the season equally strong. The indications for 1913, says Klein, are nothing less than brilliant in Philadelphia.

TUCKER MAKES A CHANGE.

H. J. TUCKER, who has been "inside man" for L. J. Mueller, Indian agent in Cleveland, Ohio, for the past year, has identified himself with the Buckeye Motor & Cycle Company, of Akron, Ohio. Mr. Tucker has bought an interest in that firm, and will handle the purchasing and sales department. Mr. Tucker has been in the motorcycle and sporting goods business for eight years. The Buckeye people sell the Indian and Flying Merkel machines.

The W. E. Wandersee Store in Detroit.

S. A. FLAMM, Emblem agent in Philadelphia, Pa., has a broad-gauge idea as to what constitutes good fellowship in motorcycle circles and does not believe that a dealer should restrict his attentions to riders of the particular make of machine in which he is in-

terested. In the accompanying photograph, taken in front of Flamm's establishment, there are several makes of machines in addition to the Emblem and their owners all feel that Flamm is a pretty good sort of a chap to know whether you ride or not.

FOR PHILADELPHIA POLICE.

GEORGE S. MASLEN, No. 2206 North Broad street, Philadelphia, representative of the Indian machine, has just received a contract to supply the Philadelphia Police Department with fifty additional machines. Mr. Maslen says: "Business has increased 400 per cent. over last year, and I have not really caught up with the orders so far this season. The prospects for a busy fall season are very encouraging."

W. G. RHODES, No. 2210 North Broad street, Philadelphia, has received additional orders from many public service corporations using the Reading-Standard machines. The United Gas Improvement Company and the Philadelphia Electric Company have both recently placed additional orders.

BIG INCREASE IN COLUMBUS.

COLUMBUS, O.—The records of the city auditor of Columbus, O., show that up to August 16, licenses to the number of 856 were issued to motorcyclists, while the whole number issued in the year 1911 was 533.

THE TORONTO TRADE.

PERCY A. McBRIDE has just secured his third order for six Excelsior motorcycles from the Hydro-Electric Commission.

Walter Andrews is negotiating for the Toronto agency of the Detroit Triumph.

Max Amoss, the popular Flanders dealer of Toronto, is expanding. He has taken over an automobile tire agency and vulcanizing plant and is opening a bicycle branch department in his new premises on King street West.

Tandem Attachments

Worthy Of the Name

Model 2.

MODEL 2

Combined Luggage Carrier and Tandem Seat

Exceptionally strong and well made. Top or platform hardwood, with binding of $\frac{3}{4}$ -inch channel steel. The smooth flat top can be used with or without cushion. No rivets. Rear stay is one continuous arch of $1\frac{1}{4}$ x $\frac{1}{4}$ -inch spring steel. Top secured by malleable iron brace fitting over top of arch. Guaranteed to carry any weight axle will hold. Price, complete, highly-nickel-plated, \$7.00.

MODEL 47

The biggest value for the money ever offered. The luggage carrier is our Model 2, with the rear arch extended and formed into foot-rest. Cushion is our Style B, spring top, an extremely comfortable seat. Very light. Combination attachment, complete, with skirt-guard and spring top cushion, \$8.75.

Model 47.

MODEL 25

This equipment may be put on in a few minutes and make an ideal passenger carrier. The weight of the extra rider is placed well forward, making it very easy for the driver to control the machine under all conditions. For the motorcyclist who desires an all-around outfit, here is the best and only one of its kind on the market. Built by motorcycle men who know. Model 25, complete, as shown, \$12.00. Model 25, less carrier, \$5.00.

Model 25.

Model 1.

MODEL 1

Readily attached to any motorcycle. Made of $1\frac{1}{4}$ x $\frac{1}{4}$ -inch spring steel. Non-breakable and non-twistable handlebar. Low, comfortable saddle position. Foot rests on spring pedals, well forward, whose wonderfully smooth action absorb all jars and assures the permanent foothold on the pedals. Model 1, price, complete, as shown, fully nickel-plated, \$15.00; without saddle, \$12.00.

Ero Stand Latch

The Ero stand lock not only does away with all soiled hands from locking and unlocking stand, but is a positive lock, preventing the stand from falling out on the road. Just press the trigger with the foot, when the stand will instantly drop out.

If the stand is lifted into position with a spring, it is then only necessary to press the foot, first upon the trigger to release the lock, and then follow the pressure down till the stand strikes the ground.

It is readily and easily attached by the same screws or rivets that attach the clip spring to the mud guards, requiring no extra screws or bolts. No. 116, price, complete, postpaid, 50c.

Note—Clip not included.

ACROSS CANADA

Hazardous Journey Contemplated by Harry Humphries and Wife.

CANADIAN riders are looking forward with keen interest to the proposed attempt of Harry Humphries, the marathon runner, and wife, to cross the Dominion of Canada as part of a world-girdling trip, on a Minneapolis 5 h. two-speed motorcycle and "trailer."

This ride, though much talked of and often proposed, has never been accomplished or even tried by motorcycle, and the general view is expressed on the Canadian side of the border that if Humphries succeeds in conquering the Canadian coast-to-coast trip, the remainder of the journey will be like a slide down a chute at an amusement park. Volney Davis saw the two oceans in less than a month by riding through the States, but it is prophesied that Humphries will not cross the Dominion in less than two months.

Very few long rides have been accomplished in Canada for the simple reason that the different populated portions of the country are thoroughly isolated by natural barriers. There are of course transcontinental railroads, but these are the only links, and Humphries will often have to ride the ties.

The Canadian Rockies cut off British Columbia in the far west. The vast prairies, with their Indian trails, come next, but the middle Provinces are separated from the well-populated east by as difficult an obstacle as could be imagined, namely, the virgin wilderness of northern Ontario, where untrod forests, rocky country, countless streams and picturesque lakes, so cut up the stretch that roadways are few and far between. In fact, the roads extend for only a comparatively few miles outside each town and otherwise there would be nothing for the Humphries to do but make their own path or take to the railway tracks.

Southern Ontario is a big stamping ground for motorcyclists, but in the Province of Ontario, the oldest in the Dominion, the roads become primitive again, being very sandy and rough. The tourists will here take the ocean-going vessels for Great Britain, thus missing the quaint old provinces of New Brunswick and Nova Scotia, but even so they would encounter almost four thousand miles of "going" that would test the nerve and endurance of the hardest man living.

Last season a single tracker did manage by frequent recourse to "the rails" to traverse a portion of the Canadian Rockies into British Columbia, but none has, however, essayed to cross the wild portion of Northern Ontario in the east. Transportation in this section is mainly effected by canoe or boat on the many waterways. It is strange, however, that the motorcycle spirit has even extended to these Northern Ontario centers.

TWO BIG CANADIAN RUNS.

THE Toronto M. C., at a big meeting held Wednesday, August 14, decided to hold a reliability tour Saturday, Sunday and Monday, August 31, September 1 and 2, to St. Catharines, Ontario, Buffalo and Rochester, N. Y., making it an international event.

The Winnipeg M. C. will hold its annual endurance run on the same days. The route, about 300 miles long, will include the principal towns in the Province of Manitoba. J. M. Moorhouse, who won the trophy last year, will defend his title on this occasion.

RACE MEET IN FAR-AWAY CALGARY

THE people of Calgary were "honored" by the presence of Barney Oldfield on the 27th of July and the 10th of August. The first races were held at the race track, a half-mile oval, right near the centre of the town. There were about ten events, three of which were for motorcycles. About 10,000 people were there, and it is safe to say that about 9,000 went especially to see the motorcycle races, which were widely advertised. Through some misunderstanding between Barney's manager and F. W. Sanguine, who acted for the club, the race for singles was left out, so that there was only a 6l class, three heats, five miles each, and best two out of three. The entries were two Indian 7's, an Indian 4 and an old Excelsior 6. The Excelsior led the whole bunch a merry chase the first seven laps, losing on the straight stretches and gaining on the curves, the rider holding her open wide on every turn, which was more than any of the others dared to do. In the eighth lap the Excelsior rider let her down a little too low on the first curve and nearly fell twice, losing about 100 feet, and the result was: Sanguine (Indian), first; Danielson (Excelsior), second, and Woodward (Indian), third. The Indian four dropped out of the running. In the second and third races the Excelsior had engine trouble, the plugs fouling first, and then the points welding themselves together. The machine being old and worn, the rings were loose and the oil splashed up past them, thus fouling the back plug. Accordingly the Oldfield trophy went to Mr. Sanguine.

The straightaway races on August 10 were held about seven miles out of town on a private course, two miles in length. The motorcycles made the mile in 1:06, standing start, and the singles 1:14, standing start. The twin event was won by Sanguine on an Indian. Walker, on an N. S. U., had the misfortune to break his crank-case just before

the race, but he fixed it up as best he could and got two thirds. The single race was won by Trail on a machine of his own build, having for its power plant a 4 h. Peugeot motor. He had things his own way, coming in fully an eighth of a mile ahead. The races were viewed by about 2,000 people, or 400 auto loads.

Enthusiasm is aroused to a high pitch in Calgary, and races on Victoria race track will in future always bring out a large crowd. Oldfield's coming to Calgary was indirectly the cause of fifty-five arrests in two days in one trap in the east end of the city. Every one ponied up \$15 and costs and tried to look pleasant. Those who didn't try to look pleasant ponied up, anyway.

BRUNOT'S ISLAND MEET.

SPECTATORS at Brunot's Island track, Pittsburgh, Pa., on August 9, saw an excellent motorcycle meet in spite of a soft track. In the two-mile handicap, A. G. Schmidt, the Pittsburgh veteran, sustained a fall, but was only bruised. Markman, the winner of the first and second events, rode magnificently. The races were held in connection with the Grand Circuit horse races, an annual event in Western Pennsylvania. The summaries:

Two-mile handicap—John J. Markman (7 Indian), first; H. F. Payne (4 ported Indian), second; H. D. Griffith (Excelsior), third. Time, 2:25.
Five-mile handicap—Markman, first; A. G. Schmidt (4 ported Indian) (handicapped), second; Russell Giesey (7 Thor), third. Time, 5:44½.

INDIAN BESTS AEROPLANE.

PITTSBURGH, Pa.—On Saturday, August 17, William Lineweaver, of Lebanon, Pa., raced an aeroplane on a half mile track, for five miles. He rode a stock Indian single, and reeled off laps in 35 seconds, easily defeating the aeroplane, a sixty horsepower Curtiss, driven by McCally.

The Reason

The P E M has taken 16 "Firsts" in the 20 races it has run is shown in this little cut—Look at the points:

Overhead mechanical valves—giving accurate firing with high compression.

Gear Driven Bosch Magneto.

Positive Mechanical Oiler that never fails—The higher the speed—the more oil fed into engine.

Chain driven positive, sure and very fast. If you would be a winner—on the track or on the road—Ride a P E M.

Write for Booklet and our liberal rider agents' proposition.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS
THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

OLD SOL
No. 1.

OLD SOL
No. 2.

The "Old Sol" line meets the requirements of every rider.

From our No. 1 lamp, which has a light throwing capacity of 400 candlepower, to "Daddy Old Sol" No. 8, the most powerful motorcyclist's lamp ever made, throwing a light equal to 1500 candlepower, the "Old Sol" line is built to give longest service, and at the same time the most efficient.

Sturdy strength and powerful light throwing capacity, are the two features upon which we base the success of "Old Sol."

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of June 13 is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I am planning to take a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and I am looking forward to a very pleasant trip.

Yours very truly,

B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waking & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,

CHAS. A. TANGEMAN.

MOTORCYCLE EQUIPMENT CO.
LARGEST MOTORCYCLE SUPPLY HOUSE IN AMERICA
HAMMONDSPORT, NEW YORK

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

The *Neverout* Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

For sale by leading dealers. Made only by

DIAGNOSIS—Ignition Trouble

PRESCRIPTION—One set J-D Visible Spark Plugs

FEE—\$1.00 per plug—money back if not absolutely satisfied

We can cure your ignition troubles, too. The new principle embodied in the J-D VISIBLE CURED SPARK PLUG enables you to locate and cure ignition trouble at a single glance.

One look tells everything

Through the port in the porcelain—outside the plug—you see if the spark is jumping the gap in the central electrode. If the spark jumps, the proper ignition fails to follow, then the plug must be foul or the carburetion faulty. If the spark does not jump, then trouble lies behind in magneto or wiring or coil or batteries. A slotted adjusting nut allows you to widen or close gap. Opened, it intensifies spark and closes point automatically. Uses minimum current, makes timing of engine easy, and permits retarding of spark in any cylinder.

If your dealer has not yet put the J-D VISIBLE PLUG in stock, we will mail you as many as you want, guaranteed, prepaid on receipt of \$1.00 per plug. Write and tell us what you want and make of motor.

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

The Right Light for Safe Riding

In night riding you do not need to see the trees at the side of the road. It is necessary only to see the road and as far ahead as possible. Most lamps, by the diffusion of the rays to the sides project the light for only a short distance in front.

20TH CENTURY LAMPS

Throw the light just where it is most needed to avoid danger—directly ahead and for a long distance.

WHY TRUST YOUR SAFETY TO ANY OTHER LAMPS?

20th Century are the best and most practically constructed lamps built. A 20-years' reputation is behind them.

A REVOLUTION IN MOTORCYCLE MOTOR DESIGN

In bringing out our DE LUXE line of motorcycle motors, we have introduced a large number of improvements, and offer these motors as the most advanced now before the trade.

NOTEWORTHY IMPROVEMENTS.

One piece crank shaft.	Simplified design throughout.
One part crank case with cover.	Reduced number of parts.
Improved cam and magneto drive.	Quiet running motor.
Oil tight motor.	Large Ball Bearings mounted in
Large Valves.	steel lined pockets.

Equipped with Bosch Magneto.

These improvements in design, together with the high grade materials used in construction, the modern methods of manufacturing applied, and the remarkable performance of these motors in road tests mark a revolution in motorcycle motor building.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per

day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4.....\$5.50	28 x 2 1/4.....\$6.50	28 x 3.....7.25
26 x 2 1/2.....6.00	28 x 2 1/2.....6.75	29 x 3.....7.50
	28 x 2 3/4.....7.00	

Other sizes on application.

Ask Your Dealer for "Bricton" Detachable Treads

Ask the best dealer in your town to show you the famous "BRICTSON" Guaranteed Detachable Tread. If for any reason he cannot supply you, fill out the attached ORDER BLANK, pin your check to same, mail it, and I will ship you the treads on TEN DAYS' FREE TRIAL, and if you don't find them perfectly satisfactory within 10 days from receipt of treads, return them and I will cheerfully refund your money. THE KANSAS SHORT GRASS TOUR IS OVER

THE SEVEREST TEST ON RIDER AND MACHINE EVER HELD IS ENDED

¶ Read the three motorcycle papers. They tell in words of one syllable the obstacles encountered on this tour—impassable roads, swollen streams and oceans of mud. Who of the riders surmounted these obstacles and finished with a perfect score?

¶ Six Yale riders started and six Yale riders finished on time at Garden City the 26th, making a perfect score.

¶ The machines are in good order, just as they started out. We leave it to your good judgment, Mr. Dealer and Mr. Rider, if a more severe test could be made to prove absolute reliability. A performance of this nature is the best proof we can offer of Yale dependability.

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and giving maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen $\frac{1}{4}$ -inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

Excelsior Single

4 H. P., Eclipse Clutch Equipped, battery model, at

\$175

It's a Live Proposition for Dealers

The Excelsior single, 4 h. p., Eclipse clutch equipped, battery model, at the price offered will sell like wild-fire—if you, Mr. Dealer, will but tell your customers of the exceptional bargain.

Now is the Time to Get Action

For the beginner—a better, a more reliable, an easier-to-handle machine is not to be had. And it's just the season when everyone has money and can afford a motorcycle.

Immediate Deliveries

The factory output is now about 80 machines a day, and we can make instant deliveries on this, as well as any other of the Excelsior models.

Jeffery-Dewitt Porcelain Triumphs Again

¶ It takes a hammer to crack a J-D Porcelain. Heat can't do it. Every claim to the superiority of this product has been vindicated—and more—by a new experience. A great motor car factory burned to the ground on the first day of last June. It was the fiercest conflagration ever recorded in the automobile industry. Heavy brick walls crumbled like cardboard; steel rails

twisted and curled like glowing serpents along the ground; immense steel girders bent and writhed in the flame; piles of aluminum castings melted into a white hot pool. When the fire had burned itself out, nothing remained but the smoking wreckage of a plant and stock worth half a million.

¶ Workmen started in to sort out the junk. Twenty-seven cars ready for shipment had been standing on one of the floors. Their scarred skeletons were found deep in the wreckage, where the flames had been hottest.

¶ Every motor had been equipped with J-D Spark Plugs. Not a single Porcelain was cracked!

¶ The case-hardened steel of the plugs had no more temper left in it than a piece of putty. The brass caps were melted off. But not a porcelain had suffered a bit of damage, beyond having the enameled lettering half burned away, as is shown in the photograph.

¶ This same quality of porcelain enters into every spark plug produced by the Jeffery-Dewitt Company. When you buy spark plugs again buy the best—the J-D line—the kind that defy heat, besides being carbon proof, soot proof, oil proof. Satisfaction guaranteed or your money back.

¶ Write for our motorists' classic: "Ignition and Spark Plug Talk." It's full of good pointers and timely information. A new edition is just off the press.

Largest Manufacturers of Spark Plugs in the World

The Motorcycle MANUAL

Is the last word on the subject of a publication giving comprehensively and in a handy form all the information required by a motorcycle rider or dealer. 104 pages, printed on coated paper.

Motorcycle engine and frame parts illustrated and fully described—their functions fully explained, with a remedy for every possible trouble

YOU NEED THIS BOOK

For it also tells you how to tour; gives the motorcycle laws of every state; official racing records, hill climbing, horsepower and other formulae, and a complete directory of the motorcycle trade. Pages are magazine size, 7 x 9 inches.

Paper covers, 25 cents, postpaid. Cloth bound, 50 cents, postpaid. Special prices on lots of 10 or more.

For \$1.25, we will send you a copy of the Motorcycle Manual and also enter your subscription to Motorcycle Illustrated for one year.

MOTORCYCLE ILLUSTRATED, 51 Chambers Street NEW YORK

Another new model—

a model that is described with every truth as "the Pullman of saddles."

Such is the

BROOKS B 401

—the saddle which meets the needs of the present-day motorcyclist better than any other saddle can.

Being anatomically shaped, you sit IN it rather than ON it, and the fact that the BROOKS, the original and only genuine Compound Springs, are placed under the weight-carrying portion of the seat, and that the latter is not hinged at any fixed point at the peak, ensures that every movement of those springs will be in a true vertical direction.

That means even greater comfort—luxury, in fact—and if that's your desire you should have it fitted to your present mount.

DEALERS CANNOT SPEAK TOO HIGHLY OF MODEL K--NEW POPE "BIG 4"

ALL that we have claimed for the POPE "BIG 4" is enthusiastically backed up by dealers in various parts of the country who have already given the new machine a thorough tryout. When reading the testimonials printed below, remember this—that they are the frank, unbiased opinions of practical business men like yourself, fully posted on what the purchaser wants and has a right to expect in an up-to-date motorcycle of the Model K type.

"The Model K machine has been received. It is there every way and a wonderful improvement over all single-cylinder machines now on the market that I have seen."

"The writer had the opportunity a few days ago of trying this model out and must say that it worked fine. I rode it for 180 miles on Monday and never had one miss. It has certainly got them all guessing on account of its quiet running, and we have named it the 'SILENT POPE.'"

"Your Model K arrived O. K. and I admired its lines and performances. It is certainly a wonder and an ideal machine for the road."

"SOLD IT WITHIN TWO HOURS AFTER UNCRATING IT."

"We received the Model K, O. K. and think it is going to be a GOOD SELLER. In regard to the order for the two Model K's we wish to reinstate same."

Pope Model H—The Pioneer Lightweight

\$165 With Magneto Equipment

The best motorcycle of its type on the market. For economy in first cost, upkeep and operation, it is in a class by itself. Has plenty of power for every practical purpose of hill-climbing and all-round road work.

MOTORCYCLE DEALERS ATTENTION!!!

The Pope Line offers the greatest selling proposition to dealers for 1913. Another model will be announced soon. We want dealers in every locality where we are not now represented. Write today before it is too late. Send for our motorcycle catalog. It's a beauty.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubos, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

Make your motorcycle a 24 hour servant

Dare you ride your machine any time and place you please? Or does nightfall catch you worried and anxious, creeping along in fear and trembling?

If so, you're missing most of the fun of motorcycling—you're tied down to the daylight limit.

But—a RELIABLE source of light, with a lamp large enough, will make your night riding pleasant and SAFE.

Oil lamps won't do—gas generators won't fill the bill either—they're unreliable and troublesome. What you need is a **brilliant, unflickering light** that floods the road ahead, searching out every bump, rut, puddle and other source of dangerous spills.

Here's the answer!

Prest-O-Lite Owners

"Nothing like Prest-O-Lite for service. Always on the job," says Charley Glenn, 2159 East 85th St., Cleveland, O.

Prest-O-Lite Motorcycle Gas Tank

This is your only source of satisfaction—because it's the *only* PRACTICAL lighting system for motorcycles.

It means a *brilliant* and RELIABLE light for you—steady under all road conditions. Turns on and off like a gas jet. The neat, attractive nickel-plated Prest-O-Lite Tank will add to the beauty and service of your machine, without adding materially to the weight.

Prest-O-Lite is not expensive. The money you invest in the tank itself is not *spent*, because a genuine Prest-O-Lite tank never becomes second-hand, is always in demand—it's a ready cash asset just like money in the bank.

And any experienced rider will tell you that Prest-O-Lite exchanges cost no more, usually less, than the carbide to feed a generator. Wherever you may be, exchange service can be had from one of our 20,000 dealers (motorcycle and automobile). We will arrange for prompt exchange service for anyone anywhere.

You shouldn't deprive yourself of the added pleasure and convenience Prest-O-Lite will give you. You can't afford to do without its SAFETY. One accident due to poor light will cost you more than a year of Prest-O-Lite service.

Price of Tank \$10

(Equipped with gauge.)

Dimensions: Length, 13¼ inches; diameter, 4 inches; weight, 8¾ pounds. 40 hours of light—easily attached to any motorcycle.

Just a word on Imitations

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one, ANYWHERE and ALWAYS. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

**The Prest-O-Lite Company 246 East South St.
INDIANAPOLIS, IND.**

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Mr. Dealer! There's a good profit in Prest-O-Lite Tanks and Exchanges. You may as well be getting it, for a simple statement of the facts about the Prest-O-Lite Motorcycle Tank will make the sale. And remember it's a bad idea to get your customers into the habit of going elsewhere for their Prest-O-Lite Exchanges if you want their trade on other things.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

“Saddles”

Inez Patterson rode through the Short Grass Tour. Of course she rode on a Troxel Saddle. There's a reason.

Troxel “No-Bump” Saddles

Always remember to specify them and your comfort is assured. The Troxel is not a *new untried freak*, but a really wonderful combination of leather and spring action. Experienced riders all ride the Troxel because they get the lowest saddle position, and altho' the spring action rides like velvet for any weight rider, you cannot hit bottom. 75% of all the motorcycles ridden carry the Troxel saddle because the riders who know—

Insist on the “No-Bump” Troxel.

ONE SUPERIOR BRAND OF TIRES

Q THE tremendous resources of the United States Tire Company are devoted exclusively to the manufacture of *one superior brand of tires*.

This one brand is the product of a co-operative method of manufacture absolutely unique in the history of tire building.

Take United States Motorcycle Tires, for instance. The individual features now entering into their construction were tested and proven years ago in two separate brands of tires, each of which had a world-wide reputation for high quality. Through this procedure every element of theory and experiment is eliminated from United States Tires. This is important to every tire user as it safeguards him against excessive cost and unsatisfactory service.

The actual manufacture of United States Motorcycle Tires is directed by four corps of specialists, each of whom has intimate and expert knowledge of every angle of the tire-making industry. And back of these men are four great factories of tremendous capacity, each equipped with the most modern machinery and appliances known.

It is inconceivable that *four* perfectly dove-tailed organizations by uniting all their skill, all their knowledge and all the resources at their command should not approach nearer to perfection in tire building than one man or one body of men.

That tires so made are exceptionally economical tires to use is proved by the mileage service United States Tires give under all sorts of road conditions.

SEPTEMBER 5, 1912

FIRST DAYTON MOTORCYCLE ON TIME

Banquet Marks Initial Appearance of Davis Company's New Product

BY way of celebrating the completion of its first motorcycle, which was finished in time for a display at the Made-in-Dayton exposition, the Davis Sewing Machine Company, of Dayton, Ohio, entertained about forty of its employes at a banquet. The social program was arranged under the direction of Superintendent J. C. Lester and was given at his residence.

Some time ago the Davis company, already holding an international reputation for its sewing machines and bicycles, decided to enter the motorcycle field and its expert designers were set to work on plans which had been outlined by Superintendent Lester. Exhaustive tests were made as the work progressed and in a short time the company officials were convinced that they could manufacture a motorcycle up to the high standard set for their other products. The staff was then ordered to put on full speed in order that the first machine might be ready for exhibition at the Made-in-Dayton fair. In order to comply with this arrangement the men were called upon to work night and day, and the banquet referred to was tendered as a mark of the company's appreciation.

Commenting on the company's new product Superintendent Lester said: "We have laid great plans for the Dayton motorcycle,

as the new machine will be called, and we hope in time to make our motorcycle plant one of the largest in the world. We are now turning out about 125,000 bicycles annually. We expect to be able to supply dealers with Dayton motorcycles in about thirty days and we will be prepared to make rapid deliveries."

It is announced that T. C. McDonald, official tester for the company, will make a long tour through the eastern states on the exhibition machine, starting in a week or two. He will be prepared to allot territory to dealers and give demonstrations in each city and town along his route.

MEETING OF CREDITORS.

NOTICE is given that a meeting of the creditors of the Pierce Cycle Company will be held in the Federal Building in Buffalo, N. Y., at 11 a. m. on September 12, to consider a proposed sale of the assets of the company. The present trustee, Lawrence P. Hancock, is not authorized to continue the business after September 9.

JACKSON IN THE WIGWAM

E. M. JACKSON, formerly of the Miami Cycle & Manufacturing Company, will enter the sales department of the Hendee Manufacturing Company on October 1.

INDEPENDENT SHOW FOR CHICAGO

Plans Are Clinched for Big Motorcycle Display February 3-8.

ANNOUNCEMENT is made that on August 29 the Show Committee of the Motorcycle Manufacturers' Association closed a contract with the Manufacturers' Exhibition Building Company, of Chicago, for 13,000 square feet of floor space to be devoted to an independent motorcycle, bicycle and accessory show which will be held during the week of the first automobile show in the Windy City, February 3-8. The building in which the independent display will be given is located at 1319 Michigan avenue, a point easily accessible, and it is stated that most effective arrangements will be made for the exhibition of the machines and their accessories. There will be ample space for all the motorcycle and bicycle manufacturers and for a goodly number of the accessory makers.

President A. B. Coffman, of the M. M. A., is convinced that the coming show in Chicago will mark an important epoch in the upbuild-

ing of motorcycle business, and that it will pave the way for such wide-spread consideration of the motorcycle's advantages as has not been possible heretofore. President Coffman has argued for some time past that motorcycles were out of their element when competing for attention with pleasure cars and automobile trucks in a general show, and all his claims for the superiority of an independent motorcycle exhibition will undoubtedly be backed before the coming display is a day old.

The Show Committee is being enthusiastically supported in its work by the manufacturers and now that motorcycles are to be allowed all the latitude necessary trade boosters are preparing to make more elaborate displays than ever before. The mere announcement that space has been obtained has put the trade workers on edge for big things and that they will be forthcoming is as safe a wager as any motorcycle enthusiast will have an opportunity to make in a blue moon.

CLASSY MEETS ON NEWARK TRACK

Hasha, Seymour and Peck Bump Dad Time On Jersey Bowl and Simon Pures Also Show Well.—Match Races Draw Big Crowds.

NEWARK, September 2.—Notwithstanding the threatening weather 5,000 fans turned out to see the match race between Eddie Hasha and Ray Seymour on the motordrome today. They were doomed to disappointment, however, as at the last moment Hasha refused to ride the match, claiming the purse was too small, and that he had never been approached by the manager about riding it.

Manager Paul Derkum claims that Hasha held out for more money when he found out the speed that Seymour was traveling. Ray Peck was substituted for Hasha, and he made a good race of it, but Seymour was the victor by a good length in both heats. Seymour beat Hasha in the first two heats of the Class A event, and Hasha retaliated by winning the final and the free-for-all. Seymour went bad in this event owing to trouble with his stomach which made him too dizzy to keep up with the flying Texan.

One of the best races of the day was the final heat of Class B event in which there were five riders. Frank King, of Denver (Indian), won out by a length from Johnny King, Newark, (Indian), and Fleckenstein, of Denver, (Indian), finished third.

NEWARK, N. J.—Ray Seymour's debut in Newark on Saturday, August 24, did not cause a rush to the races in the way the management expected. Newark is new to the motorcycle game and does not know the big factors in it as yet. The feature of the day was the match race between Ray Peck (Excelsior) and Seymour (Indian). Seymour won both heats. Larry Fleckenstein, of Denver, eliminated John King, of Newark, from the sweepstakes by catching him in 2½ miles, doing it in 1:51.

SUNDAY, August 25.—The announcement that Ray Seymour and Eddie Hasha, Newark's idol, would ride a match race on their big 8-valve Indians brought a crowd of 10,000 people to the motordrome today and taxed the seating capacity and arena to its

utmost. Hasha had been ill and felt so weak that it was thought it would be impossible for him to ride. Eddie did not wish to disappoint the crowd, however, and getting his physician's permission, he agreed to ride the match. The match race was a thriller. The boys jockeyed for a start and went slowly around the saucer, watching each other closely, and changed positions at every lap. On the bell lap Seymour was leading with Hasha clinging in his pace. With bodies flattened down on the tank they both opened up wide, and the crowd saw Hasha pull slowly past Seymour and win by half a wheel's length. Hasha's wheel wobbled perceptibly all through the race, and when he came to a stop he was carried from the track and revived for the next heat. He came back a little stronger and a little more confident. The second heat was started at a faster pace, with Seymour leading. Getting a little jump Seymour opened up and increased his lead, but Eddie closed the gap and took the lead. Seymour could not get by him, and they finished in that way, a wheel's length separating them.

FINAL DIVIDEND.

H. TATEM PATTEN, trustee for the Reliance Motorcycle Company, of Owego, N. Y., has filed a report requesting the declaration of a final dividend, and creditors of the company, are given notice to appear before Referee Benjamin Baker at 9 a. m. on September 10 at the law office of Fred J. Davis in Owego to show cause why such action should not be taken.

ZEISLOFT ON THE STUMP.

DAN ZEISLOFT, formerly on the publicity staff of the Diamond Rubber Company, has withdrawn from trade circles temporarily to take the stump for the Republican party in New York State. Zeisloft explains that he intends to talk motorcycles once more when the election has been disposed of, provided he survives the strenuous campaign.

DENVER COPS IN TROUBLE.

DENVER, Col., August 30.—Police Commissioner Creel and Adjutant-General Chase have a fight on over the new khaki uniform worn by the traffic squad and speed officers, and unless one or the other backs water a dozen Denver policemen may be arrested within the next few days. General Chase has sent notice to the Fire and Police Board that the khaki uniforms of the motorcycle police too closely resemble the uniforms of the officers of the United States Army and that the State law prohibits civilians from wearing even a single garment conforming with the regular military garb. The law provides a fine and jail sentence for every violation.

While Chase is insisting that Creel cannot dress his motorcycle policemen like soldiers and is threatening to swear out warrants against the policemen who appear on the streets in military uniforms, Creel and the Fire and Police Board are smiling and refusing to regard the matter seriously.

BUSY KITTLE PLANT.

S. L. LYON, well known to motorcyclists in S. Los Angeles and vicinity, has accepted a position as manager of the Kittle Manufacturing Company's headquarters in Los Angeles. He reports that out of 1,337 motorcycles in the recent run of the Los Angeles M. C. to Venice 923 carried Kittle attachments. The Kittle factory is running night and day to meet the demands being made upon it, and new machinery is about to be installed to facilitate the manufacture of the company's products.

ANGSTEN-KOCH PATENT.

ANNOUNCEMENT is made by the Angsten-Koch Company, of Chicago, that it has been granted the first application for a patent on its Simplex tandem attachment. The patent, which was issued on August 27, is number 1,036,702.

ABOVE is a reduced copy of the engrossed resolutions sent to President Paimier, of the Continental Rubber Works, as an expression of the appreciation of the jobbers who were the company's guests at Erie, Pa., Saturday, August 10.

"SILENT" L. R. BOWEN
THE METEORIC MERKELITE

International Tour

Donald McKie

Part III

FOLLOWING is the third installment of the touring article being written exclusively for *MOTORCYCLE ILLUSTRATED* by Donald McKie, one of the four motorcycle tourists from Atlanta, Ga., who sailed recently for a 6,000-mile trip through western Europe. The first two installments of the article dealt with the journey by motorcycle from Atlanta to New York city; the present story gives interesting sidelights on roads and motoring customs in and near Copenhagen, Denmark, where the tourists left the steamer, and also embodies much practical information for the American rider who contemplates a European tour by motorcycle.

We arrived in Hoboken with a great rush half an hour before the steamer sailed for Denmark, but once on board we had no end of leisure. There was practically nothing to do throughout the ocean trip but read, eat, sleep and wish for our motors, so that this stage of our trip demands only scant attention. Previous writers have given all the available information concerning the crating and shipping of machines; these matters are quite simple, after all, and need cause a prospective foreign tourist no uneasiness. It suffices to say that our journey across was without incident, and in due time we found ourselves strolling up the wharf at Copenhagen.

Acting upon advice from the Royal Automobile Club of England, we had decided not to ride in Denmark before leaving for Sweden and without being taken out of the Customs House, known in Copenhagen as the Free Harbor, our motorcycles were placed aboard a boat for Malmö, Sweden. This trip requires two hours, and on arriving in Malmö it is a very simple matter to obtain a temporary driving license at a nominal fee. It is worthy of note that we arrived in Copenhagen on July 3, and having forwarded our motorcycles to Malmö we were obliged to get along without them over the Glorious Fourth.

Ideal Country for Endurance Riding.

At this point we feel called upon to warn endurance riders and American trans-continentalists against touring in Norway and Sweden, for motorcyclists with these inclinations would never find time to rest in this territory. The reason is a simple one; there is no night worthy the name. In Christiania, Norway, for instance, it was never necessary to burn street lights while we were there, daylight being practically continuous throughout the twenty-four hours. In the window of one of the motor shops we found a sign which informed us that automobile lamps were to be lighted at 12.01 a. m., and two hours later another day had dawned. In other words, the tourist here gets only a hint of darkness, and gas tanks for motor lighting purposes must be almost superfluous.

After making the necessary arrangements at

In Denmark—The Olympic Games—Good Roads and Fine Scenery

A Danish Inn.

Malmö we took to the road and found the highways in southern Sweden composed mostly of clay. From this it will be seen that traveling is good only in fair weather. About halfway to Stockholm, however, well-kept macadam is found and we had no trouble except in getting around occasional rock piles where repairs were being made. The country is given up to farms. Gasoline, or motor benzine, as it is known here, can be procured almost anywhere in cans. We found that the roads had many dangerous turns, but as there was very little traffic over them we made fairly good time.

In Stockholm for the Big Games.

When we arrived in Stockholm the city was aflutter with decorations for the Olympic games. We rode out of the city about four miles to witness the start of the 200-mile bicycle race. The first men were sent off at 2 a. m. and there was plenty of light. Much

regret was expressed by the members of our party, and doubtless by hundreds of others, that a big motorcycle event could not be staged, but the Olympic contests must be genuine tests of physical strength and the officials do not regard motorcycle races as anything more than mechanical tests. Wherein they are sadly mistaken, as every full-fledged motorcyclist knows. In Stockholm we met the first Americans we had seen since leaving the boat and they looked mighty good to us, as the saying goes.

Just before leaving the city we met Carl Larson, of East Saugus, Mass., and Frank Jansen, of Providence, R. I., who were touring Sweden on Indian sevens. They reported no trouble and had enjoyed the run from Malmö to Stockholm, about 400 miles. From Stockholm we returned to Copenhagen to begin our tour of Denmark. It was necessary to obtain papers permitting us to bring our machines in without duty, and we had some difficulty in convincing the officials that one new tire and two leather treads which we were carrying were for our own use and not for sale. They finally passed us, however.

Viewed by Danish Crowds.

On our way to the police station to obtain our driving licenses we discovered a motorcycle shop and dropped in. The proprietor inspected our machines and was deeply impressed with them, so deeply in fact that he is to become an agent for the Indian. The proprietor, Walter by name, is now handling the Hobart and the Stewart two-stroke, both English-built machines. He stated that the total motorcycle sales for the country footed up to about 400 machines a year. Half an hour later we had obtained our licenses and were riding in the streets of Copenhagen. The cost of the visitor's permit to ride all over Denmark is only two kroner, about 54 cents. Ordinarily it is necessary to go before the fire department officials and demonstrate the efficiency of brakes and permit of an inspection of the machines, but Mr. Walter managed to save us this trouble.

It is necessary to carry the number plate on the front of the machine and it is fastened there by the police. The last requirement is an official lead seal, similar to those used on freight cars in America, which is attached to the number plate. Without this seal the driving license is not valid. We enjoyed a trip into the country with a number of Copenhagen riders and in the evening a banquet was arranged in our honor. The riders treated us royally. On the following morning we were photographed by a representative of a newspaper and a picture with a column of reading matter concerning us appeared later in the day. Needless to say, we did not know what it was all about, being unable to decipher a line of it.

After a sight-seeing trip through Copenhagen we decided to strike out for new adven-

tures, and the riders of the city gave us a royal send-off. We left Copenhagen with two suitcases strapped on the carrier of one machine, one case on another and the regular passenger on the tandem seat of the third motorcycle. A young man on a 2½ Hobart acted as our guide out of the city. We found the streets narrow in the business district, but once on the country roads we had excellent going. All roads have posts giving the distance in kilometers to the next town, and cross-roads are also carefully marked with signs. These signs and a road map, which we had purchased for fifty cents, enabled us to make good progress and keep to our route.

It is worth noting that all railroads here are controlled by the government and as a result they are well guarded at every grade crossing, something that cannot be said for our railroads in America. At Vordingborg we made a short stop to visit the remains of a castle built in the seventh century. Leaving Vordingborg over fine roads we went to Kallehave, a fashionable summer resort. Here we witnessed what to us was a most remarkable sight, an elderly lady wearing glasses and smoking a big black cigar. This appears to be an ordinary arrangement in Denmark, but it sort of bowled us over.

No Lack of Striking Scenery.

On the following day we visited the island of Moen, going by ferry. The trip costs 13½ cents for each machine and five and a half cents per passenger. We rode to the chalk cliffs on the island and enjoyed the scenery, which was of a character entirely new to us. When we were ready to leave it was nearly 6 p. m., and we stowed away an excellent meal, prepared in typical Danish style. We were joined by Mr. Walter and another motorcyclist whom we had met in Copenhagen and we rode together for a time. Walter had a passenger on his little 2½ Hobart, but the machine stood up well under its double load. The other rider used an Ellehammer machine, 1907 model, which was still in excellent condition. This machine is a queer-looking Danish mo-

del, the rider's position being almost the same as that of a person standing. Ellehammer, the manufacturer of the machine, is said to have been the first man to use an aeroplane in Europe.

Although none of us knew a word of Danish we had little or no trouble on the road. When it was necessary to inquire the way of a farmer, for instance, we simply called out the name of the town we aimed to reach and then pointed in the direction we thought it might be. If we were wrong the farmer would point in another direction and that was the end of it. We put up for the night at Nykjobing, a town of 10,000 people, and obtained good beds at the Phoenix Hotel for 54 cents. There we learned that the boat running from Denmark to Germany did not leave until 2:30 p. m. the following day, so we had plenty of time. We had only 20 kilometers more to ride in Denmark.

In the Kaiser's Realm.

We made a leisurely run to the ferry on the following day and boarded the boat for Germany, managing to get through without having to drain our tanks of gasoline. It required two hours to make the trip, and the fare was 73 cents for each passenger and 43 cents for each machine. On landing in Germany we encountered the customs officers who weighed our machines, examined our papers and then escorted us to an office where we received our numbers and driving permits. At the office we had to show our papers again and after waiting about an hour we received a little card which entitled us to ride in Germany for 30 days at any time within a year. When leaving the country a rider has this card stamped and it is stamped again on his return so the officials are certain that he does not remain over 30 days in all.

A rather large number and wire to fasten it with was supplied and we were charged five marks, this, with three glasses of beer for the officials, bringing the cost to \$1.24 for each of us. From what we had read of touring in

Germany we expected to be tied up for two or three weeks and to suffer about everything except execution before we received our permits, but the whole operation was quite simple. Perhaps this was due to the fact that before leaving home we secured from the Secretary of State in Georgia an official paper stating that we were duly licensed there; later this paper was passed upon by the German Consul. We would advise all American motorcyclists who contemplate a foreign trip to follow this plan.

The Outlook in Denmark.

Before taking up the story of our trip into Germany let us say a few words concerning the advisability of touring in Denmark and the outlook there for the motorcycle. If one merely wants good roads Denmark is an ideal country for the motorcycle tourist, for the roads are monotonously good; nearly all macadam and well kept. At the side of nearly every road is a bicycle path and riding on this is the very limit of comfort. However, the scenery is not particularly striking, except on the island of Moen where the chalk cliffs are well worth seeing. The country generally is given up to vast farms, quaint old houses and windmills. These notes refer to the country only as far north as Helsingør, for we were not above that point.

As to the future of the motorcycle in Denmark, it should certainly be good. With the excellent roads which prevail there should be ten times as many motorcycles in use as there are at present. Bicycles are very popular, thousands being seen on the streets of Copenhagen alone, and it is only reasonable to believe that many of these riders will join the motorcycle ranks when they become acquainted with the attractions of the motor two-wheeler.

A Puncture Causes Trouble.

Leaving Warnemunde we struck out over German roads and soon reached Rostock. The roads were fairly good but in the towns the cobblestone pavements made us sore, physical-

On the road near Copenhagen.

Fountain in Copenhagen.

Ferry to Isle of Moen.
Among the Hills.

ly and mentally. About ten kilometers out of Rostock we sustained a puncture in the rear tire of the tandem machine, on which we were using a leather thread, and we had our own troubles before we were able to start again. It is no small job to locate a small hole in the inner tube and then replace the leather cover. It happened that we stopped near a pool of stagnant water and a gang of mosquitoes made things hot for us. While we were making the repair a native approached and we drove a bargain with him to house us overnight. He proved to be the keeper of a roadside inn.

We lost count of the number of eggs that we stowed away at supper, and in a short time we were in the hay, sometimes referred to in jest, but literally true in this instance. The charge was very reasonable, only two marks, 48 cents, each for lodging, supper and coffee in the morning. It appears, by the way, that coffee in the morning is always included in the price of lodging here. We started rather late on the following day and found little to interest us on the road. The scenery was not inspiring and our only amusement lay in sampling apples and cherries which grew in abundance along the highway.

The Arrival in Berlin.

That night we put up at another roadside inn, in what appeared to be a full-fledged wilderness. We turned out in the morning fresh for our ride to Berlin and aside from the cobblestones encountered in the towns we had no trouble on the way. The most important town we struck on the road to Berlin was Neustrelitz where we found a large dairy and drank much milk before continuing. On leaving this place we soon ran into some small hills and almost before we realized it we were on the outskirts of Berlin. We stopped about three miles out of the city for the night, not caring to ride in until the next day.

On our arrival at the capital we were duly impressed, but we must say that motorcycles are not as plentiful as might be expected. Quite a number of Cyclonettes, as they are called, are used for delivery vans. These vehicles have three wheels, two in the rear, and the engine is placed directly over the front wheel, which is chain driven. There is a two-speed gear and a long handle for steering.

Gasoline Comes High.

Wherever we have stopped our machines have attracted much attention. We have found that nothing gives the onlookers more pleas-

In Copenhagen; tourists surrounded by a curious crowd.

ure than twisting the grips and watching the levers work. Apparently they are puzzled by the operation of the enclosed controls as used on American machines. Looking back over the section of our tour just finished we must say that roads in Denmark are far superior to those we have traversed in Germany. By this comparison, however, it should not be understood that German roads are poor, but simply that those in Denmark are better. In both countries we have found the natives genial and inclined to welcome the visitor.

We have found the price of gasoline rather high, both in Denmark and Germany, but the quality appears to be good and we have not felt like complaining seriously. With the 7 h. twins we have averaged somewhat better than 65 miles to the gallon, but to secure this satisfactory mileage we have operated our machines very carefully. We have traveled quite slowly, running most of the time with spark advanced and throttle entirely closed. On the whole our expenses on the road have not been high, but on the next leg of our tour we may find something that will cause us to dig deeply into our wallets. However, we are crossing no bridges until we reach them, and we do not expect serious trouble.

NO BOWL FOR MONTREAL.

IT is reported that Jack Prince, the prince of board track builders, was a recent visitor in Montreal, Quebec, to look into a proposition to erect a motordrome there. The project received its quietus, however, it is understood, when an attempt to hold a big motorcycle carnival resulted in a heavy loss.

Toronto has the board bowl bug again, however, as a movement is on foot there to establish a motorcycle plant at Dufferin race-track, a little used trotting ring, in view of the difficulty encountered in obtaining permission to use the Exhibition track for racing.

AFTER CANADIAN BUSINESS.

THE Prest-O-Lite Company of Indianapolis, Ind., is making a big bid for Canadian business. Factories have been established at Meritton, Ontario, and Winnipeg, Manitoba, to turn out gas tanks for the Canadian trade, while an up-to-date branch store has been opened at 722 Yonge street, Toronto, where all sizes of tanks may be immediately exchanged. H. R. Weckerle, of Indianapolis, is in charge of this station. The manufacture of tanks at the Meritton factory began on August 26.

Line-up of Harley-Davidson riders who took part in recent big meet in Livermore, Cal.

DENVER'S NEW POLICE SQUAD.

SPEEDERS beware! Denver's motor police squad went into action August 1 and the men in khaki will get you unless you are exceedingly careful in the matter of running within the speed limit and observing all the other rules set down by the fire and police board for motor-propelled vehicles. Hereafter even the remotest sections of the city will be patrolled and speeders who have been in the habit of "sneaking" just a little on the outskirts, where formerly there was no one to raise a detaining hand, will find themselves the object of attention from members of the new motor squad.

The officers will make their headquarters at the outlying fire stations, reporting by telephone to police headquarters every half hour. In addition to regulating motor traffic, they will be used for emergency work. The uniforms of the men are of olive drab cloth, fashioned after the uniforms of the United States Army field officers and consisting of cap, jacket, riding trousers and puttees, not to mention the life sized star on the left breast of each.

The squad includes Officers U. H. Baker, Denver's first speed officer; Henry Barr, another veteran, and six new men who have never before piloted a big seven.

A SIDE-CAR CONVERT.

LAURENCE BIGLER, proprietor of a busy motorcycle headquarters in Goshen, Ind., recently made two trips to Chicago, a distance of 131 miles, in six and a half hours with his Excelsior twin and side-car. He was accompanied by Dan Boomershine, his mechanic. Bigler argues that the side-car has doubled the pleasure-giving possibilities of the motorcycle. He finds that instead of hampering the machine on bad roads the passenger attachment serves to steady it and thus enable the driver to pick his way along.

A GREENWICH ENTHUSIAST.

GEORGE BARNES, who appears on the machine in the accompanying photograph, is the M. M. agent in Greenwich, Conn., and a booster of the new school. He believes that the side-car is a real motorcycle asset and practices what he preaches by driving an M. M. hooked up to one of the comfortable passenger attachments. Barnes is almost as proud of his motorcycle outfit as he is of the three contented-looking youngsters who have snuggled down in the basket for a trip with "Dad."

SAN FRANCISCO police are to have seventy-five motorcycles for general service.

ANOTHER CITY IN LINE.

UNDER a new motorcycle ordinance to take effect September 2, in Flint, Mich., unless a machine is built to accommodate more than one person it will be unlawful to carry a passenger. In no case will the driver be allowed to have passenger in front.

A SIDE-CAR HANSOM.

IN striving to perfect an economical vehicle which would fill the breach between the street car and the ordinary taxi-cab, H. K. Hedges, of Hedges Laboratory, 108 North Spring street, Los Angeles, Cal., has designed the outfit shown in the accompanying illustration. The side-car attachment follows the general lines of a hansom cab and closely resembles a new side-car model with which experiments are now being conducted in London, Eng. The cab is light in general construction but sufficiently strong to meet all the requirements, and the designer is convinced that it will add very little to the upkeep of an ordinary motorcycle. A windshield, carried under the seat, may be quickly arranged in the event of a storm, and another handy feature is the rack on top of the cab which permits of carrying suitcases or other similar articles.

Designer Hedges believes that such a cab as he describes will become very popular in cities like Los Angeles and New Orleans, where a motorcycle outfit may be used all the year round and where there are many tourists who would be attracted by a quick, comfortable and economical means of transportation to hotels and points of interest. The idea seems to have possibilities.

The STORY of a MOTORCYCLE CONVERT

BY THOMAS C B TYLER

*Riding in the old days
compared with the
pleasure of driving
a modern single-tracker.*

MY antipathy to the single-tracker dated from the early days of the machine, when controls were on the tank, belts everything but a joy, efficient mufflers a dream of the future and reliability a will-o-the-wisp. The care and attention, the petting and coaxing necessary to keep the thing running did not appeal to me as fun or pleasure, and the price seemed too much to pay for a mere toy. After a short period of activity, in which several machines were disposed of, the dealer in our town quit the business and in a year or so motorcycles were as scarce on our streets as the proverbial white blackbird.

A little over a year ago the revival started. The appearance of several machines that would actually run, that would start without half an hour's fiddling with the various parts, did much to convince some of us that we were overlooking a bet and perhaps missing something that was chock full of fun. We of the laity would question, watch and make fun while at the same time we were envying the proud possessors of machines.

The "put-put" of a cycle would arouse us from any work or dream and the stopping of the machine in our immediate neighborhood would cause us to sally forth and bombard the rider with queries and compare his machine with others we had either seen or read about. A machine standing beside the curb was sure of a crowd of interested spectators, and the group would stare in open-mouthed surprise if the rider was able to get started without pedaling one to two blocks. We thought starting should be easy and so when it became the accustomed thing to see a rider get his mount under headway without a world of back-breaking labor several decided that the game must be worth the candle and invested.

An acquaintance of mine bought an old $3\frac{1}{2}$ single and seemed to have so much enjoyment adjusting the carbureter, monkeying with the timer and renewing batteries, that I became convinced that something like that was the very thing I needed to relieve me of ennui and to occupy some of the spare time that hung so heavily on my hands. He told me where I could get a second-hand machine quite reasonably and got so interested in seeing that I got one that he hunted up the owner and sold it to me himself—fine business. The original owner had tired of the sport

and was willing to sacrifice to get it off his hands. There was nothing wrong with the bus; oh, no, nothing wrong. The carbureter needed adjustment and a new valve lifter would have to be obtained; otherwise the machine was in fine condition, so I was told.

One week after purchasing I made my first trip. In the meantime I had taken the carbureter apart approximately one thousand times and as perseverance overcomes all things I was finally rewarded by having it work. The broken valve part had been improvised out of a nail bent to resemble a letter Z. This was fastened to the cylinder head in such a way that when the throttle was closed it depressed the intake valve and released compression. My first ride worth talking about was to a little town and return, going one way and coming back another. The oiling system was now the conundrum and as long as I owned the machine it remained a puzzle; either too much or not enough was the rule. Once the piston stuck when I was thirty miles from home and some distance from any house. Not a thing did I have to put oil into the cylinder, but necessity devised a way. I unscrewed the oil supply pipe and making a cornucopia out of an old letter the feat was accomplished.

I seemed to have every conceivable sort of trouble. The gas pipe broke; the oil pipe did likewise. The vibration of the engine was so intense that one time it was being held in the frame by only one bolt when I noticed it. Another time, running to escape a shower, I was compelled to stop time and again to tighten the screws in the outside flywheel, which seriously threatened to come off.

A Troublesome Mount.

I would have one good ride, then have to tinker with the machine for several days to get her in tune again. The power, only $2\frac{3}{4}$ h.p., was also a constant source of worry, so I commenced to look around to see if I could not find someone who wanted a cheap machine. I was lucky, and by adding a little coin of the realm I left a certain dealer one fine morning with a four horse battery model of a standard make, V belt, grip controls, power to spare, as much speed as I cared for and a good looker—even if two years old.

Then the fun began. I was up every morning at 5 o'clock spending two or three hours on the road. I became acquainted with more of the surrounding country in

one season than I had in all my previous twenty years of residence in this community. I found charming drives where I least expected them, beautiful scenery in places undreamed of, a pleasure and satisfaction in the performance of the old bus that was truly enjoyable. My experience with the former mount was the best possible training to teach me to keep a good one in fine trim. But three times did she stall when I was unable to have her working in a few moments. One time the cotter pin of the intake valve spring broke and was caught under the exhaust valve as it descended. This bending the valve an infinitesimal part of an inch was sufficient to destroy the compression. To the eye the valve seemed to seat as finely as ever and the simple expedient of marking the valve with a lead pencil, then twisting a few times to make sure if the seating was correct, was unknown to me at that time, so to a repair shop I wended my way.

A Mysterious Ailment.

Another time had I not been in a hurry I could have found the trouble. It was in the carbureter; a spring holding the air valve slipped off the post to which it was fastened and stuck in a groove. I took it to a repairman and had to leave; he found the trouble but refused to tell what it was and I never knew until the same thing happened the second time. Then I drilled a hole through the post and put a cotter pin through that, and I believe the spring will stay in place for some time to come.

The third case has always been a puzzle to me and it also made the repairman guess a little. I was just entering town, spinning along at a moderate pace when the motor suddenly refused to work. The quickness of the stop led me to infer that the electrical part of the machine was out of kelter and, sure enough, no spark was obtainable at the plug. I tried an extra one and that refused to work. I cleaned the commutator and still no spark; then I tested the batteries and found them quite low. I walked to the first garage and bought three new ones, put them in and still no spark. I went over all connections several times, but the spark failed to appear, so to the shop we went. The repairman examined everything, pronounced it O. K. and was nonplused at the refusal of the machine to start. Unfastening the wire that led to the timer he again tied it to several parts of the machine, but no

spark would come and he started to raise it up out of the way so that he might look into the commutator. As the end of the wire brushed by the carbureter a big fat spark leaped forth, much to our astonishment. Refastening to the timer I got in the saddle, kicked her over and she went with never a miss. Where had the juice been all the time?

How the Fascination Grows.

Such things as these, one might think, would have a tendency to dampen the ardor of a person for the sport, but they don't since the little accidents and mishaps come so seldom with the improvement in machines. And then what can compare with a spin some early morn, some afternoon or on a drowsy Sunday? You mount the old bus and proceed to leave the town, the heat, the dust, the traffic. The houses become more scattered, the pavement ceases and dirt roads are encountered. You increase the speed, feeling a thrill of pleasure as you notice the machine pick up and at the knowledge that you have such power ready to do your bidding. You come to a hill and go up without hesitation. A bit of sand is met and you work your way through with some slight misgivings as to its treacherousness. Again the going becomes ideal and you loaf along, admiring a pretty view or an excellent farm.

A big touring car slips up behind and honks warningly; you let them pass unconcernedly until the man driving the car turns, laughs derisively and waves goodbye to you. Then the race is on. Old Betsy is picking up all the time, but the car being under such headway at the start of the race, continues to gain to the extreme merriment of the young lady occupants of the rear seat, who wave their hands to you to come on. You commence to gain and the car driver opens up another notch; still you gain, for the old bus is just striking her gait. He tries more speed, but you are within a couple of rods of him now and hang there like grim death, re-

fusing to be shaken. The young ladies have ceased their laughter and the driver is doubting the word of the dealer who told him that the car was able to do fifty-five with a full load. The road broadens and you have ample room to pass. The hum of the machine assumes another tone, your speed increases, the old bus has responded to every call and you pass the car.

When you have slowed down again the same car approaches, toots the horn and goes by, but no one laughs.

Finally you reach home. Your lungs have been filled with pure invigorating air, your eyes have seen much that is beautiful, your whole body is atingle with the pleasure brought by contact with Mother Nature. You're a better man for your trip, so hats off to the motor single-tracker.

"Doc" Thornley (to the left) and former F. A. M. President Hamilton (in Goodyear balloon).

THESE RIDERS CART LUMBER.

MINNEAPOLIS, Minn.—It has remained for motorcyclists in Minneapolis to introduce the two-wheeled "lumber wagon." Recently pedestrians heard a clatter as of a runaway team dragging a wagon, and scampered for safety before ascertaining the real cause. Up the avenue at high speed came two motorcycles. Beneath the seat of each machine was a small hanger into which the end of a heavy jag of lumber had been fastened. The other end of the load dragged on the pavement.

The two motorcyclists were Francis and John Markoe, of 5410 Lyndale avenue S. They are building a house in a suburb in the southern section of the city, and have devised the above means for cutting down carting expense. They say that as much as 400 feet of lumber has been hauled by the motorcycles in one load and that the work can be done much more cheaply in this way than the lumber companies can do it.

TYPESETTING BY MOTORCYCLE.

WHEN a heavy storm played havoc with the Phoenix (Ariz.) electric service newspaper workmen operated linotype machines by connecting a motorcycle with the main drive shaft of the typesetting system, and turned the paper out on time.

Affiliated Club Certificate.

F. A. M. TOUR AWARDS.

NEARLY 400 motorcyclists in twenty-one states have just received from G. B. Gibson, secretary of the F. A. M., certificates of honor for successfully completing one leg of the F. A. M. tour to the recent convention at Columbus. The certificates have been especially prepared suitable for framing and are being sent to the riders as a reward for motorcycle sportsmanship. In addition to the certificates the riders were presented with gold medals by the F. A. M. before they left Columbus for the homeward trips.

NERVY THIEF IN SYRACUSE.

SYRACUSE, N. Y., has a thief whose nerve is up to the standard. A few days ago a motorcycle used by the police department was stolen and at latest reports there was no clue to its whereabouts. It is suggested that a thief who has the effrontery to take a department machine may also have his eye on the patrol wagon. The missing machine is described as follows: single cylinder Harley-Davidson; magneto and free-wheel; motor number 2775B.

George A. Sun, also of Syracuse, reports the theft of his Harley. The motor was number 4103. Both these machines are 1912 models and practically new.

E. A. Slover, chief of police of Portland, Ore., reports the theft of a twin-cylinder Harley-Davidson, 6½ h.; state license 7645 and factory number 3822.

EMPIRE STATE ROAD SIGNS.

FRANK D. LYON, secretary of the New York State Automobile Association, is working out a plan to distinguish each main route throughout the State by an individual color. The routes leading from the main highway will be painted with combination colors.

The route from New York to Buffalo, for example, would be distinguished by the top rail of the State fence being painted blue. Each bridge will have a painted strip about two feet in width, and the telegraph poles will also have a section painted to correspond to the color of the fence. Through each city and town the association will erect colored discs, similar to the well-known Goodrich signs.

LONG ROAD RACE.

E. J. HAWKINS and E. F. Kumler recently participated in a race from Cleveland to New York on their motorcycles. They left Cleveland at 6 a. m. Wednesday, August 21, and arrived in New York the following day. Hawkins, who won the purse of \$100, arrived in New York at 10.32 a. m., being six hours ahead of Kumler.

INGENIOUS FITTINGS.

INDIVIDUAL fittings to machines are all ways of interest, and the machine ridden by H. Mason, proprietor of the Melrose (Mass.) Motorcycle Agency, has several that go a long way toward ease and comfort for the rider. The clutch is connected by Bowden wire to the left-hand pedal, which has been disconnected from its normal operation of the brake. A bucket seat with lazy-back is fitted and an extra gasoline tank is mounted back of this seat as will be seen in the photograph.

More

Pointers on

Skidding

*Pennsylvanian Takes
Issue With Writer
Who Charged Most
of Skids to Front
Wheel.*

MURRY FAINESTOCK

IT has been said that we learn most from those whose opinions differ very widely from our own, and I am inclined to believe there is more than a grain of truth in this adage. For instance, I read with great interest Mr. C. A. Shaw's article on "Skidding," which appeared in *MOTORCYCLE ILLUSTRATED* about three months ago. Mr. Shaw concluded that nearly all falls from skidding were due to slipping of the front wheel, and it is just there that our opinions diverge. In my own experience with three motorcycles I have had only two front wheel skids, and in both cases I was able to avoid a fall. The story of my rear-wheel skids is of an entirely different nature.

While it is doubtless true, as Mr. Shaw suggests, that a front-wheel skid is more dangerous than one occurring at the rear wheel, I argue that skidding of the front wheel is so rare that it should cause no uneasiness. Furthermore, if the front wheel does skid, the rider may often avoid a fall by turning the front wheel in the direction of the skid, thus allowing the wheel to revolve and obtain a fresh grip on the surface. Turning the front wheel in the opposite direction from the direction of skidding serves only to aggravate the trouble and makes a fall almost inevitable.

Some Causes of Skidding.

A skid occurs when it is easier for the wheel to travel sidewise than straight ahead. Since the front wheel runs on nearly frictionless ball-bearings it is evident that if the wheel be turned in the direction of the skid, so that it is easier for it to revolve than to slide, the tendency to skid will be eliminated. However, this method of counteracting a skid is applicable only to the front wheel, as the direction of the rear wheel is not so easily changed.

A consideration of the theory of skidding will show that a skid will occur whenever the wheel loses traction due to any of the following causes: inertia and centrifugal force, most noticeable on curves; the accelerating effect of the engine; the retarding effect of the brake; an uneven road surface, especially on a crowded road, car tracks, and "pure cussedness," which may be a combination of any of the preceding causes. Mr. Shaw is correct in stating that the weight on the rear wheel is twice that on the front wheel, but I differ from him in believing that the greater the

weight will be the tendency to skid. His argument, as I recall it, was that the extra weight over the rear wheel helped to keep it on the road and to avoid slipping.

Theory and Practice.

Those who have ridden tandem machines or who have traveled with much weight on the luggage carrier know that the tendency to skid was greatly increased. Since the weight on the rear wheel is twice that on the front wheel it follows that it is twice as hard to stop or change the direction of the rear wheel when once in motion, while the frictional coefficient between the tire and the road is not altogether proportional to the weight. If it were simply a case of friction between two plain surfaces, then the theoretical law that friction is proportional to the pressure would hold good, but in practice the mud may adhere to the tire and then the decisive factor will be the viscosity of the mud.

Mr. Shaw's comparison of the motorcycle and bicycle, in which he stated that a bicyclist riding up and touching the rear wheel of another machine with his own front wheel would be thrown, is hardly justifiable. His argument points out the stability of the rear wheel in the one case and the susceptibility to outside influences of the front wheel in the other case, but he proves nothing. The case is not one in point. In my opinion the motorcycle is more closely related to the automobile than to the bicycle when it comes to skidding.

Use of Non-Skid Devices.

Experienced automobilists frequently put chains on the rear wheels of their machines when driving over slippery roads, but it is only under exceptional conditions that a car owner will place chains on the front wheels. The reason is obvious; front wheel chains are generally regarded as superfluous. To get back to Mr. Shaw's argument referring to the front wheel of one bicycle striking the rear wheel of another, I would say that he then

has an external force to deal with and that it is nearly always forces inherent in the motorcycle that cause skidding. Moreover, if the front wheel were held as rigidly in the frame and the weight of the second rider were equally distributed between the two wheels it is by no means certain that the bicyclist to fall would be the one whose front wheel touched the other machine's rear wheel.

When Mr. Shaw placed steel non-skid studs on his front wheel he found that it held to the road like a leech. Of course it did, for there was so little tendency for the front tire to skid, even under ordinary conditions, that with the steel non-skid studs the front wheel did not skid at all.

The Spring Fork Problem.

Had Mr. Shaw placed the non-skid studs on the rear wheel it is doubtful if even then the front wheel skids would have been entirely eliminated. Mr. Shaw himself states that when the front tire was equipped with non-skids the rear wheel "did a few fancy steps all to itself," and if he enjoys doing a Gaby Glide on his rear wheel he differs from most riders who I have known.

Another point: Mr. Shaw states that the spring forks cause the front wheel to bounce, but I believe that actual observation will prove that good springs enable the wheel to follow the road more closely than if springs were not used. He also fails to take into consideration the fact that when the pressure against the ground is least the tendency to skid is also at a minimum.

The retarding effect of the brake, especially if it be so strongly applied as to lock the rear wheel, is one of the most prolific causes of rear-wheel skids. It is evident that when the rear wheel is locked it will slide with equal facility in any direction, and the same effect is obtained, only to a less extent, when the brake is not so heavily applied. For this reason the brake should not be applied when passing over a slippery road surface. The machine should

have its speed reduced, if necessary, and then be allowed to coast with the clutch disengaged.

Another, though less important cause of skids, is the uneven pull of the motor; this is most evident in single-cylinder machines but may be minimized by loosening the belt idler or partially disengaging the clutch, if it is a

chain-drive machine. This is an additional reason for coasting over slippery spots, as a spinning rear wheel is likely to skid in any direction. Uneven road surfaces, such as car tracks, etc., should be crossed slowly and as nearly at right angles as possible, especially if wet. Large tires are less likely to skid than small ones, as the greater surface is more likely to find a fairly dry spot to adhere to.

It is mainly to reduce the danger of skidding that it has become the most advanced automobile practice, especially abroad, to attach brakes to the front wheels in spite of the increased cost and complexity involved. For this reason the use of front-wheel brakes on motorcycles would seem to have much to recommend them. Those bicycle riders who used front wheel brakes will remember that they had little skidding trouble, while any motorcycle rider who will lock his rear wheel by the sudden application of his brake is almost sure to skid—decisively and often spectacularly.

ALWAYS MARK PHOTOGRAPHS.

PHOTOGRAPHS submitted for reproduction in *MOTORCYCLE ILLUSTRATED* should always be accompanied by the title of the picture and the full name and address of the sender. This information may be written upon the back of the photograph or embodied in a letter mailed with the photograph. Never mail photographs alone and unmarked. *MOTORCYCLE ILLUSTRATED* welcomes every picture calculated to make an appeal to riders or the trade, and it is regrettable that photographs of highly interesting subjects must occasionally be laid aside because no title accompanies them and their senders are unknown.

TORONTO'S BIG SQUAD.

THE registrar of motorcycle licenses at Toronto, Can., has already issued 1,750 number plates this season and the applications for permits are still pouring in. This number is far in excess of last year.

NOT WITHIN THE LAW.

A QUESTION has arisen in Mississippi as to whether motorcycle owners are required to pay taxes on their machines. When asked if motorcycles came under the provision of the automobile tax law, the attorney general replied that they did not, the law applying only to four-wheeled vehicles, propelled by gas or electricity. The next legislature will probably amend this law to include the motor two-wheelers.

WHERE WEIGHT COUNTS.

WEIGHT plays a greater part in motor racing than in any sport outside of horse racing, say followers of the bowl riders. Eddie Hasha, the Dallas speed marvel, and Arthur Chapple, of New York, two of the best, are examples of this. Chapple is forced to train steadily to keep in racing condition, while Hasha's weight of only 118 pounds counts heavily in his favor.

Buffalonians on eventful Tour

J. Binns Drake

GLOOMY weather prevailed when my partner and I left Buffalo for our tour to Danielson, Conn., but having laid our plans carefully we were not to be daunted by a threatening sky and, as the endurance boys say, we pulled out on schedule time. In the morning we covered about 80 miles, going through Batavia, LeRoy, Caledonia and Avon. Two miles east of Avon we stopped and enjoyed a lunch that we had carried, and a short time later we were under way for Geneva, reaching that place about 4:30. Just outside of Geneva the road was very sandy for two miles and we were called upon to do some pushing. A few spills also added spice to the outing at this juncture.

We reached the Auburn ferry at 5:45, and less than an hour later we had crossed and started on our run to Auburn. Arriving in Syracuse at 8:20, after a detour, we struck a street that had just been heavily oiled and several more spills were added to our list. Our destination for the night was Onondaga Valley, where we were royally entertained by friends.

On the Trail to Utica.

On Sunday we arose at 9 a. m., but it was almost noon when we took to the road. Four miles out of Syracuse my partner's brake holder gave way, breaking his chain and bending the frame and luggage carrier a little. To prove that trouble did not worry us we dropped into an ice cream store, refreshed ourselves and then made repairs on the machine. We pulled into Utica at 5 p. m. and made a sightseeing trip about the city before "turning in." We started at 7 o'clock the next morning and 9 o'clock found us at Little Falls. We made

a good start but, an hour later, sad to state, we were back at the garage again. Thereon hangs an unfortunate tale.

About three miles out of Little Falls we passed a horse and buggy. Jacobs, my partner, rode by without mishap, but as I passed the horse became frightened and swerved to the side of the road, throwing out the occupants of the rig, a young lady, an elderly man and a middle-aged man. The latter had his arm broken in two places, the old gentleman was given a bad shock and the girl was seriously shaken up, although she escaped injury. Realizing that prompt action was needed I jumped into the saddle and set sail for a doctor. At my second stop I located a physician and was on my way back with him when we learned that a doctor had passed the party on the road after I had left and had brought the two men and the girl into town.

The Jaunt to Boston.

After being exonerated from blame and finding that I could be of no further assistance, I started out to locate my partner,

To Boston, Charlestown and New Providence by Way of Albany and Pittsfield—A Lot of Fun in Return for a Very Small Outlay of Money.

who had been too far ahead to witness the accident. I found him on the road leading out of Little Falls. He had seen the horse caught and had returned to the scene of the mix-up, arriving as the doctor appeared. He gave all the assistance possible and when I joined him we headed through Fonda to Amsterdam. Our dinner stop was at Schenectady. Without trouble we reached Albany and the cobblestones encountered there will long be remembered. We reached Pittsfield at 5:30 and after supper obtained a fine view from a neighboring hill.

We pulled out of Pittsfield by a detour, going over some sandy and rutty road. In descending a steep hill my brake refused to hold and I spilled on a turn, but came through without injury. We stopped at Springfield for dinner. In Worcester we stopped for an hour so that Jacobs might visit his Alma Mater, Worcester Poly-Tech. It was 7 p. m. when we arrived in Boston. The trip through the Berkshire hills was one of the best either of us had taken. The road winds up and down and around the hills in most picturesque fashion, but the grades are not bad and any machine in good condition can climb them.

At Charlestown Navy Yard.

We spent a day in the Charlestown navy yard, made a trip through Old Ironsides, and also inspected a large wireless station,

in which we were both deeply interested. For dinner I ordered beans and expected to get something out of the ordinary, but much to my surprise they were about the same as we get at home in cans. In the afternoon we took a boat ride to Nantasket Beach and had a look at the Atlantic ocean. The next morning we left for Providence, R. I., arriving at B. A. Swenson's motorcycle headquarters at 12:30. Swenson gave us a warm welcome. We had dinner at Oakland Beach and then left for Danielson. Between Green and Danielson we struck three miles of sand and some pushing was in order.

About two miles out of Danielson there is a fine swimming pool, known as Kellingly Pond, where Jacobs spent many a pleasant hour in his boyhood. We could not resist the temptation to take a plunge and Jacobs asserted that the old place was as satisfying as ever. Arriving in Danielson we went to the home of my partner's uncle and for several days we made the most of the opportunities for recreation in the vicinity. We returned to Buffalo over the route followed in coming out, except for the run from Providence to Worcester instead of to Boston.

Novel Wireless System.

There was one feature of our trip which was probably distinctly new from a motorcyclist's viewpoint. As we are both telegraphers we perfected a wireless system by using our horns as transmitters, thus avoiding the necessity for shouting whenever we had anything to say on the road. It is surprising how much fun can be knocked out of such an arrangement, and it also has its practical value.

I have prepared a statement of my expenses for the trip, and find that they were as follows: Gasoline, \$2.99; oil, 82 cents; garage service, \$1.50, and parts, 39 cents. This gives a total of \$5.70, a very reasonable outlay, in my estimation, for a trip which gave such big returns in recreation and general interest.

MOTORCYCLE BANDITS.

THREE motorcycle bandits recently attempted to hold up Ethan Grassfield, of St. Joseph, Mo., just outside of Colorado Springs, but Grassfield's auto proved fast enough to permit him to escape.

MOTORCYCLE SCOUTING TRIP

A Search For A Good Fishing Place—Sand Navigation And Diverse Other Tribulations

By G. M. J.

IT all happened because I am something of an enthusiast on the subject of fishing, and because my friend, the Doctor, has also to admit considerable weakness along the same line. Doc doesn't as yet ride a motorcycle, though he is mightily interested. The trouble with him seems to be that he is a chronic worshipper at the shrine of "the conventional," and as it is unfortunately not the conventional thing for physicians in this particular part of the country to avail themselves of the handy little two-wheeler, he cannot quite bring himself to the point of getting one.

"But, Doc," I have often said, "bone-setters in other places ride 'em, and they ought to do it here. Why don't you break the ice, and show all these back-number M. D.'s that they don't know a good thing when they see it. Be a motorcycle missionary among the medical fraternity!"

But Doc always shakes his head, decidedly, yet sadly. Sometimes I suspect that he almost wishes he isn't a doctor, so that he could ride a motorcycle and still not violate those precious Down-East conventions. But I am getting away from my subject, as the dusky-hued monarch remarked when he found himself outsprinting a disloyal follower who

wished to bolo him—and here's where I return.

Doc and I had long planned a raid on the bass of the Hoosatonic River, some miles above Derby, Conn., but something was always coming up with one or the other of us to spoil our plans. Finally we definitely set the day—for about the tenth time—and shook hands on it, under the agreement that whoever backed out on this occasion would have to stand treat for a good dinner. The only question was whether we should try the river or a lake. We knew about the lake, but were strangers to conditions in the river, and we wanted to go where we would be sure to connect with the finny tribe.

"Now, see here," said Doc one evening in his office, as he puffed away at a fragrant Havana, and like a good fellow tossed me his well-filled case, "that river trip is a long one, and if the fishing's poor there, we're stuck in the place for a whole day."

"Righto!" I exclaimed, "and if you'd only buy a motorcycle, we wouldn't have to depend on the beastly jerk-water train. We'd be independent of all time-tables then."

That gave Doc an idea.

"You've talked so much about the motor-

Connecticut Tour—"Some Sand!"
Suspension bridge across the Hoosatonic.

cycle's always making good," he barked at me; "give me a demonstration. Go up the river on your machine and fish it. If the bass bite we can go ahead as per agreement; if you find there's nothing doing, then it's ho for the wind-swept beaches and beautiful coves of the good old lake!" (Doc gets these poetic streaks once in a while) "Bass enough there anyway, but if you tackle the river it'll save us the danger of being most terribly stung. You've got to do it."

"If you put it that way I suppose I have," was my reply. "I'll go up there to-morrow

afternoon on a scouting trip and report in due season."

Thus it was settled.

The next afternoon found me ready to start—fish basket strapped on the luggage carrier of my M-M twin, together with a small net for capturing live bait. Two rods—one fly rod and one for bait—were projecting from the game pocket of my hunting coat.

From New Haven to Derby runs an oiled State road that was once like a highway in paradise—smooth as a billiard table. However, an average of about two autos per minute pass over that road, and what they've done to it is a howling shame. Now it is undulatory and wave-like where the semi-plastic combination of tar and fine crushed stone has been rolled into a series of billows by the action of the big tires. This wave effect is so realistic that one almost feels seasick when riding over it, though that road is really divine compared to what you find after leaving it. My only trouble came when the bait net was jolted adrift, after which I slung the perverse thing over my shoulder.

Derby is a backward town; it is a sort of joke in Connecticut, anyway. Any vaudeville actress who wishes to make a hit with her audience always brings in some crack at Derby, and poor Derby is so used to being the goat that I don't believe it minds the harsh gibes any longer. Well, Derby's main street is built of irregular blocks of stone, and in the whole length of the street there are no two of the same size, shape, or height above what would be the mean road level, if there were any such thing in Derby; instead, the road is mighty mean and not a bit level. Even Satan would scorn to have such a highway through his sulphuric domains. That street is positively the worst I have ever ridden over in any city, village, or town during a motorcycle career that covers four seasons. It is a relic of barbarism, a throw-back from the dark ages. Any of you fellows who have been so unfortunate as to go through Derby know that I speak the truth.

Well, I got by finally, though my spinal column felt as if some one had been hammering it with a pile driver, and I had begun to wonder whether my rims could possibly keep their circular shape under such adverse conditions. Presently I found myself riding up the valley of the Hoosatic. The scenery along the river is really beautiful, but a motorist can only appreciate it by stopping, for the road is so full of ruts and sand—with here and there a stretch of cobble stones thrown in for good measure—that he can only let his eyes wander from the straight and narrow at risk of a spill.

I got along fairly well, though it seemed to me that I was striking considerable sand. Then I discovered what a mistake it was to consider the road that far as sandy, for I suddenly found the place where they make all the sand in the world. In comparison with it, all other sandy stretches would be compelled to hang their heads in hopeless shame. Everyone who is lucky enough to be a motorcycle rider knows what sand—deep sand, I mean, with ruts in it—will do to the equilibrium of his power plant. I had plenty of power, but my wheels got into a rut, and then the front one tried to climb out. That was a very foolish thing to do; any self-respecting front wheel ought to know better than to try to climb out of a rut in deep sand, and I told it so, with emphatic variations. My remarks didn't do a particle of good; too late

LIKES TANDEM RIDING.

THAT tandem riding for long distances is comfortable and safe is the opinion of Mrs. Arthur M. Wieland, who occupied the saddle of a Simplex tandem attachment on a trip from Buffalo to Chicago via Columbus, returning to Buffalo afterwards. The picture shows the Wielands taken at Columbus during the Convention week.

I made a frantic grab for the clutch and missed the knob on the handle. Whereupon the road jumped up and hit me in the face.

After I had spat out a bushel or two of moist sand, I righted the motor, which was quite a task, for she had tried to bury herself in the rut. I had my kodak along, and exposed a film to serve as proof of my contention that the afore-mentioned road is some sandy, and then proceeded on my way, by keeping the motor going at fair speed and slipping the clutch a trifle. Of a verity and in sooth, a clutch is indeed a handy little trinket.

About eight miles above the famous town of Derby a suspension bridge crosses the river—Zoar bridge, it is called—and close by it is a small store where by some mysterious blessing of Providence one can get things to drink. It was just like meeting an oasis in the desert, and I almost looked around for a caravan of fierce-looking Arabs mounted on camels. After I had washed down what sand was still sticking in my breathing tube, and flushed out my cylinder head, so to speak, I inquired about the bass fishing. They told me that if I went about 'steen miles farther up the river I might find a few, provided I had particularly good eyesight.

Thereupon I started again, meeting more sand, with an occasional hill thrown in. But my two-lunger simply snorted up the inclines with never a whimper. One was worse than the others, and just to show my contempt for it, I gave the motor a lot of gas at the half-way point. She went ripping up like a saw through a ripe watermelon, but as we whizzed over the summit I perceived something that caused me to jam on the brakes in a hurry. Before me, and reaching clear across the road, was a deep ditch; Heaven alone knows what it was doing there. My momentum was too great to check and I crashed into that yawning chasm, which fitted

my front wheel as neatly as a No. 2¾ pink satin slipper fits a No. 3½ foot.

"Good night, forks!" I cried in horror, and as a mocking echo to my plaintive wail came a vicious snap. Something had gone, but I felt thankful that the whole frame had not caved in, so hard did I hit that wretched hole. A quick examination showed the two top leaves of my spring fork broken off, for while spring forks will stand a good deal, they have their limits. By good luck it was no serious damage, and the forks would hold all right if I didn't try any more fancy stunts. From then on you may be sure I was careful about hitting the bumps.

After the fork adventure I met more sand, always with two deep ruts leading through it. I rode with both feet spread out—like a knock-kneed clothes pin—kicking the ground on each side as occasion demanded, and by that unique and graceful method succeeded in keeping an even keel. Whenever I did happen to get stalled, it was simple enough to escape from the difficulty by using the clutch; getting through there without one would have been a task to frighten even Hercules himself. The fact that I got along so well simply proves that the modern motorcycle can go practically anywhere.

Finally I stopped riding and turned my attention to the bass, first securing a good supply of bait. As this is not so much an account of a fishing trip as of a motorcycle run, I will pass lightly over my attempts to coax the small mouths from the cool recesses of the river. Suffice it to say that they were exceedingly coy about being coaxed. I started back about 6:30, for I wasn't any too keen to ride that river road by night, but on the return trip was so used to it that I left the saddle only twice—once at the store for more liquid nourishment, of which I was in sad need, and once at Derby to light up.

Doc and I went fishing a day later, but we turned our steps towards the lake, satisfied to let the river alone. My report entirely convinced the genial M. D. that to go up the Hoosatic at that particular time was worse than useless, for my experience, combined with what the natives had told me, went to show that the bass fishing in the river was most decidedly N. G. And it was the motorcycle that saves us a fruitless excursion. All of which gives me one more strong argument to throw at my medical comrade in favor of the handy little vehicle that always makes good.

ANNOYING REGULATIONS.

BECAUSE they did not care to placate the feelings of the customs officials at Toronto, Canada, with a deposit of \$75 as prescribed by the Dominion regulations, Mr. and Mrs. J. Harold Jones, motorcycle tourists of Utica, N. Y., were compelled to abandon a trip through the Province of Ontario on August 22 last.

The couple left their home two days before on an Indian seven, upon which practically every convenience necessary for a trip had been placed. A steamer carried the tourists across Lake Ontario to Toronto, where they were stopped and really "deported" although they were respectable citizens. The incident thoroughly disheartened the couple, who had considerable to say about Canadian restrictions that was not exactly flattering. Mr. and Mrs. Jones immediately took another steamer for Ontario Beach, N. Y., in order to take a tour through their native State.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

THAT motorcyclists are taking deep interest in the Improvement Contest now being conducted in these columns, is evinced by the numerous suggestions received daily. Most of them are essentially practical, and all are worthy of close attention by those who are devotees of the two-wheeler. The third series of suggestions is published herewith. The conditions of the Contest are reprinted below for the benefit of those who have not read the original announcement in *MOTORCYCLE ILLUSTRATED*.

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

IMPROVEMENT IDEAS DESCRIBED AND ILLUSTRATED

EXHAUST CONSTRUCTION.

A PERMANENTLY fitted exhaust horn is to be formed in the exhaust-pipe, by cutting a slot or port at the elbow as shown and fitting a cover and butterfly valve. These are operated simultaneously by suitable means by the rider. When the "horn" is closed, the cover fits over the port and the valve allows a passage of the gases direct to the muffler, but when it is desired to use the whistle, the cover is swung around and the valve cuts off the passage to the muffler, forcing the gases to pass through the notch in the valve, and out through the port. The gases impinging on the edge of the port produce a whistling sound. Inset shows the shape of the butterfly valve. Contributed by Murry Fahnestock, Allegheny, Pa.

THE Philadelphia police department has purchased forty-nine more motorcycles.

GAS TANK LOCATION.

IN place of the tool-box between rear mudguard and seat mast, place Prest-O-Lite or other gas tank in that space, strapping it to seat mast. Connect outlet by union coupling to a 1/8-inch copper pipe with leads to tail and head lights, fitting valves and nipples to control lights. Tubing goes under mudguard at rear and along top tube to front light. Tank will be turned on at all times, and opened at valves for gas. The connections would be permanent. Contributed by Chas. P. Clarke, Bakersfield, Cal.

TWO-SPEED GEAR.

A SIMPLE two-speed gear of the compound type is here shown. Chain drive is used, and the countershaft has two sprockets, both loose on it, but either of which can be clutched by suitable means. The rear wheel has also two sprockets driven by separate chains from those on the counter shaft. The speed ratios depend on the teeth in each set of sprockets. For the high speed, A drives B and C drives F. For the low speed, A drives B and D drives E. The two chain drives may be on opposite

sides of the wheel if desired. Belts may be used instead of chains. This form of transmission should be used with footboards, starting crank and band-brakes. Contributed by S. Cleaves, Cambridge, Mass.

LIGHTING GENERATOR.

A GENERATOR for lighting, constructed on dynamo lines could be fitted to any machine with chain or belt drive. For belt machines, the dynamo is fitted at E and carries on its shaft a pulley D which is driven by the

flat belt, which latter runs over pulleys B and C. A fixture F permits the dynamo to slide back and forth to put it out of or in action. At G is an alternative position of the dynamo, attached to the seat mast tube. For a chain-drive machine, the dynamo is mounted on the rear stay, slidably as before, and has a sprocket C which is driven by the drive chain as shown. Contributed by N. H. Lunt, Dover, N. H.

GENERAL CONSTRUCTION.

A MOTORCYCLE design embodying the tank-in-frame construction and unit power plant, incorporating a two-speed gear, is suggested. The upper or tank members of the frame are of aluminum alloy and incorporate the tool-box and fuel tank, while the

rear member holds the oil and lighting outfit, which is a generator and battery equipment. Final drive is by shaft, and the generator is driven from this shaft. Foot-boards are fitted and pedals operate the band-brakes and idler wheels. Four twisting grips; one each for spark, throttle, clutch and gear operation, are fitted. Contributed by C. Ruedi, Berkeley, Cal.

AUTOMATIC OILER.

THIS oiler keeps the level in the crankcase the same at all times, its action being that of a float in a carburetor. The oiler communicates with the crankcase by a port in its bot-

tom, and has the needle valve guided. The light spring keeps the valve off its seat and is only forced upwards by the level of the oil acting on the float. The oiler is to be fitted on the side of the crankcase. Contributed by W. A. Rettig, Garrett, Ind.

SPRING SEAT PILLAR.

A COACH-SPRING used for carrying the saddle is here shown. A rocker R is pivoted to a fixture B on the seat mast tube and to the rear or free end is fitted the linkage characteristic of the coach type fork. F is the main spring, S the fixture for the seat and C a clamp for attaching to the top tube. The

operation is similar to that of the corresponding type of spring fork. Contributed by S. Gustasne, Orient, Iowa.

HINGED MUDGUARD.

HINGED mudguard, chain guards, and fuller equipment. For convenience in tire and rear wheel repairing, the mud-

guard should be hinged, so as to enable the wheel to be drawn right out instead of having to lift the whole machine upwards. After riding in mud or dirt, the rider's clothing is generally soiled by leaking oil combined with the dirt, but if the chains were fully guarded, this would not be the case. The use of these guards would enable the chains to run in an oil bath, and also keep the tire, spokes, rim, etc., from collecting oil.

With the present arrangement of clutch lever on the left and spark grip on the right, the throttle grip is on the wrong side, if the clutch is to be operated properly in sand or other heavy going. The lever should be put on the right-hand side where the throttle could be operated without reaching over with the right hand. Or the present arrangement, with the throttle on the right-hand grip and the spark on the left-hand grip, would be good also. A full equipment, following the practice in automobile circles would be desirable. This to consist of a good horn, speedometer or odometer, lamp and generator or gas tank, magneto cut-out, luggage-carrier with a good board top and resting on springs are suggested as articles of a first-class equipment. This equipment is to be optional to the purchaser. Contributed by C. E. Parker, Dunbar, Penna.

VARIOUS SUGGESTIONS.

A COIL spring to lift the stand and latch it is desirable for the rider, as are also the fitting of priming cocks and piping from gasoline tank to cocks. Guards against mud and water should be fitted over the motor pulley or sprocket, fastening by bolts and brace to the crankcase. Filler caps should have chains attached to prevent being lost or dirtied by laying down. Tail-pipe to be fitted to muffler to carry the exhaust beyond the rear wheel. More clearance for magneto, to obviate oil running on it from the gear case and for fording streams. Contributed by S. R. Brene-man, Lanark, Ill.

BACK FROM 1,000-MILE TRIP.

BALTIMORE, Md., September 2.—Roger Wilkens and F. E. Rasmers have just returned from a journey of 1,000 miles on their motorcycles. They were gone for two weeks. The boys hit out for Springfield, Mass., as their ultimate destination and they made it in good time, traveling sometimes at the rate of 58 miles an hour and traversing almost 200 mile in one day. They did not hurry themselves on the trip northward, stopping to enjoy canoeing in the Delaware river and for a dip in the ocean at Atlantic City. With the exception of using ferries when necessary and the trip from this city to Philadelphia the two men traveled the entire distance on their motorcycles. They went from here to Philadelphia and returned by boat, the roads being in such condition that they did not care to tackle them.

President Frank Boyd, of the Maryland M. C., is another tourist who has just returned from a long hike awheel through New England, New York and New Jersey. Before coming home he dropped off at Atlantic City and enjoyed a good rest.

MEMBERS of the Capital City Motorcycle Club, of Little Rock, Ark., recently made a run to Mount Nebo, Ark., a distance of 100 miles.

Folding Mudguard. B. T. Ellis, of Baltimore.

BUILDING NEEDED AT ONCE.

REALIZING that there is no time to be lost in connection with plans for handling the 1913 output the officials of the Minneapolis Motorcycle Company have decided that they must have a building ready for occupancy instead of waiting for the erection of a new structure, and they are now working along those lines. It was announced some time ago that the company would house its plant in a new structure in order to facilitate the manufacture of machines for the coming season, but is now believed that suitable accommodations can be obtained for the present in a four-story structure which is available in the south-eastern section of the city.

NEW BOWL IN ST. LOUIS.

ST. LOUIS (Mo.) speed fans took a new lease on life on August 31 when the new \$20,000 motordrome was officially opened, and there are indications that the racing game will be well supported in that city. The new bowl has been erected at an angle of 62 degrees, and it will be necessary for the riders to maintain a speed of about a mile a minute in order to hold a place on the incline.

BOOSTING 1913 ORDERS.

BALTIMORE, Md.—The motorcycle business in this State will be better the coming season that it was during the last. Howard A. French & Co. have already entered an order with the Hendee Company for 500 machines of the 1913 output. Last year this firm disposed of 300 machines in Maryland and the District of Columbia.

TIEMEYER SHOWS CLASS.

BALTIMORE, Md.—Freddie Tiemeyer continues to show his class as the premier rider of Maryland. He went down to Salisbury, Md., last week and entered the four motorcycle races run in connection with the annual fair. There was nothing to it but Tiemeyer and he showed the dust to the field in the four races carded.

QUESTIONS and ANSWERS

ANSWERS to Question No. 3, the operation of a high-tension magneto, were not very numerous, and this is surprising inasmuch as the majority of riders have magneto ignition fitted. The question related to the operation only, and the first prize is awarded to A. F. Clement, 204 East Franklin street, Mansfield, La. The second prize goes to David Kuskin, 764 East 161st street, New York, N. Y.

Many of the replies gave more attention to the construction of a magneto and correspondingly neglected the operation. The Editor of the Questions and Answers Department must again caution contributors against saying too much, and repeat that they adhere strictly to the subject given. The answers to Question No. 5, given below, will be published in the October 3 issue.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the second issue following the number in which each question is asked. For example, answers to question Number 4, published in the August 22 issue, will be printed in the September 19 issue. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York."

Question No. 4. What is a flywheel and what are its functions.

Question No. 5. Suggest means for improving the typical control system.

FRANK

MERRITT

HIGH-TENSION MAGNETO.

IN awarding the prizes for the answer to Question No. 3, the operation of a high-tension magneto, the winning answer was judged that of A. F. Clement, 204 East Franklin street, Mansfield, La., and the second prize was awarded to David Kuskin, 764 East One Hundred and Sixty-first street, New York City. The reply given by Clement is excellent, answering the question as it was given, and is printed below:

In the operation of a high-tension magneto, as the current leaves the armature it is offered two paths: the shorter, through the interrupter to ground, and the longer, through the primary of the induction coil on the armature to ground. A third path through the condenser is only apparently available; it is obstructed by the refusal of the condenser to permit the passage of the current, as the condenser merely absorbs a certain amount of current at the proper moment, i. e. at the instant of the opening of the interrupter. The interrupter being closed the greater part of the time, allows the primary current to avail itself of the short path it offers.

At the instant at which the greatest current intensity exists in the armature (when the latter is nearly horizontal), the interrupter is opened mechanically so that the primary current has no choice but must take its path through the primary of the induction coil. A certain amount of current is at this instant absorbed by the condenser. This sudden rush of current into the primary induces a high-tension current in the secondary winding which has sufficient pressure to bridge the gap

of the spark plug. The sharper the rush of current into the primary winding the more easily will the necessary intensity of current for a jump spark be induced in the secondary winding.

The distribution of the current in proper sequence to the cylinders is accomplished as follows: The high-tension current in the secondary winding is delivered to a distributing brush carrier that rotates in the magneto at half the speed of the engine crankshaft. This brush carries slides over insulated metal segments, there being one for each cylinder. Each of these segments connects with one of the terminal sockets that are connected by cable with the spark plugs. On single and two-cylinder magnetos, the segments are on an extension of the armature and the brush or brushes in the casing, and the magneto is driven at half the speed of the engine crankshaft. At the instant of interruption, of the primary current, the brush is in contact with one of the metal segments and so completes a circuit with the spark plug connected with that segment.

Should the circuit between the terminal and its spark plug be broken, or the resistance of the plug be too great to permit a spark to jump, the current might rise to an intensity sufficient to destroy the induction coil. To prevent this a safety spark gap is introduced, which allows the current to rise only to a certain maximum, after which discharges will take place across this gap.

Second Prize Winner.

Kuskin's answer was as follows:

A high-tension magneto consists of three important parts: 1, the magneto; 2, the armature; and 3, the commutator. The magnets are permanent horseshoe or U-shaped, usually in pairs, with like poles together and having pole pieces so that magnetism can be converted into dynamic electricity when the armature is rotated within the pole pieces. The armature has two windings, a primary and a secondary, each with an end in common, with their other ends connected to the timing device and to a segment which revolves with the armature. The commutator carries the segment and has fixed brushes which are connected to the spark plugs.

With the armature up and down, no voltage is produced, but when turned to a horizontal position through a quarter-revolution, the voltage is at its maximum, decreasing to zero when the armature is again up and down. During the next half-revolution, the voltage rises from zero to a maximum and falls again to zero. Thus electricity is generated every half-revolution but the current is reversed, and thus alternates.

The current is primary in the primary circuit and passing through this winding induces a secondary current which goes to the plugs. The path is from the end of the high-tension winding to the segment, then through the brush on the commutator and over the wire to the end of the spark plug. The high-tension current is necessary to overcome the resistance of the gap between the points of the spark plug, and the current jumps this gap and fires the explosive charge which is the propelling power of the motor.

MOTORCYCLE VS. INSURANCE.

PINCUS JEWELL.—A fire insurance policy usually has one or more clauses therein stating that the storage of gasoline, or like inflammable or explosive liquids, is or is not forbidden under the terms of the said policy, and it appears that with the motorcycle stored in the rear of the establishment, you would be in a position of storing gasoline, the gasoline being in the tank of the machine. Drygoods stores usually have policies that forbid the storage of any inflammable material whatsoever, without, of course, having a special clause inserted to permit of the use and storage of gasoline, etc., as when conducting a cleaning department. Lacking such clause, if a fire occurred, and the motorcycle was on the premises at the time, the insurance company might be justified in refusing to pay the insurance, on the ground that the risk of having the motorcycle on the premises nullified the policy by being an added risk, or even that the fire was caused by the motorcycle itself.

Unless you come to an agreement with your insurance company, we strongly advise your storing the machine elsewhere, as you stand to lose the amount of insurance in toto, as given above. We doubt whether the company would consent to have the machine on the premises even, except upon payment of a big additional premium. The nature of the goods would make the risk too great.

SHORT STROKE MOTORS.

FRED LARKE.—The Merkel 7 h. twin motor is of the short stroke type, the bore being 3.45 inches and the stroke $3\frac{1}{4}$ inches. This is true also of the 4 h. single of the same make. Among the "square" motors (in which the bore and stroke are equal) are the Waverley 4 h. single, the 6 h. twin Merkel, the 5 h. Minneapolis and the $6\frac{1}{2}$ h. twin J. A. P. The latter is a racing type; see the answer to L. W. Gibson in this issue.

A racing motor does not necessarily have a short stroke; most of them are "square." Almost any good speedy stock motor can be converted or made faster by drilling pistons and rods, porting the cylinders, fitting different cams, re-timing and re-balancing. But motors so treated, and also those for speed only, are not to be recommended for general purposes; being lightened they would not have the life under wear and tear that the stock motor has, and would soon be disabled. Slow running would be almost impossible, and the fuel consumption away up. The same might be said about oil. A ported motor quite frequently takes sand, etc., through the ports, with results better imagined than described.

RACER QUERY.

L. W. GIBSON.—The J. A. P. motor ridden by John J. Cox, at Brighton Beach track is a $6\frac{1}{2}$ h. p., 45 deg. twin, with a bore and stroke of $3\frac{11}{32}$ inches each. It is fitted with five cooling flanges per cylinder, three being on the removable head and two on the body. The valves are overhead and the motor is ported. The frame was made up by James Baxter of Edinburgh, Scotland. Control is by lifter, short-circuiting switch and sparkgrip, the throttle being worked at the carburetor direct.

BALANCING AND PORTING.

McL. SAWYER.—Have the connecting rods of equal weight and the pistons the same, as at present. Drill pistons on the tail, again weighing them and seeing that they

are equal in weight. If desired, drill the connecting rods through the web, keeping the weights the same. Rest the flywheels, connecting rods and pistons connected up on knife-edges by the cranks, allowing the one of the rods and its piston to hang vertically and the other horizontally. If the flywheels tend to rotate drill them until they just balance on the knife-edges. We advise your sending the motor to the makers for any careful balancing, however. They can do it better than the average shop-man. The ports should be exposed about $\frac{3}{8}$ of an inch before the piston reaches its down dead-center. Time the exhaust valve to open about at the point on the stroke where the ports are half open, if the cams will allow of this.

MOTORCYCLE BUGGY.

R. G. PATTISON.—We do not think it probable that any motorcycle manufacturer would market a buggy made up of two motorcycles side-by-side with a body between. For one thing, it would be almost impossible to get the two motors to run alike and the whole vehicle would tend to move toward the side having the slower or less powerful motor. If, when at speed, one of the motors slowed down or stopped, a disastrous accident would probably result. For this reason alone, you would find it difficult to persuade a manufacturer to build such a vehicle. Its appearance would also be against it. A vehicle along similar lines was built abroad two years ago, but both rear wheels were driven from a single motor, of two-cylinders rated at 8 horsepower. It was little more than a freak and never could have been a commercial success.

ENGLISH MACHINES.

A. BLUSSON.—1, the Douglas and Scott machines are not represented in this country. The addresses of the makers are: Douglas Brothers, Kingswood, Bristol, England; Scott Engineering Company, Mornington Works, Bradford, England. 2, The cost for the $2\frac{3}{4}$ Douglas would be close to \$385 at New York or other Atlantic port, and the cost of the Scott about \$460. 3, *The Motorcycle*, 20 Tudor street, London, and *Motorcycling*, 7 Rosebery avenue, London, are the principal motorcycle publications in England. *Radwelt*, Berlin, Germany, is the chief German publication. At present, there is no French journal devoted to motorcycling.

TRANS-CONTINENTALIST M. E. Gale, who forwards the above photo of Mrs. Gale and their Emblem machine, writes: "You don't have to leave the main roads to find lakes in Colorado."

TO BENTON HARBOR, MICH.

CONSTANT READERS (Pa.)—From Palmyra go direct to Harrisburg via Hummelstown, Rutherford and Paxtang. From Harrisburg take our route number 56 to Altoona. From Altoona go on to Pittsburgh via Allegheny Furnace, Eldorado Stiffler, Duncanville, Summit, Cresson, Ebensburg, Bel-sano, Strongstown, Indiana, West Lebanon, Shady Plain, Apollo, Hyde Park, Leechburg, Schenley, Freeport, Ingleside, Karns, Peters, Bouquet, Springdale, Cheswick, Denny, Sumner, Etna, Willow Grove, Allegheny City.

From Pittsburgh take route 145 to Cleveland, Ohio; then 104 to Toledo. From Toledo take route 125 to South Bend, Ind., and from South Bend take roads as follows: South Bend, Bertrand, Niles, Berrien Station, Royalton, St. Joseph, and Benton Harbor. The route numbers refer to routes in our Touring Number.

HAS BEEN USED BEFORE.

DAVID KUSKIN.—Your idea of individual belt and chain drives for different speeds or alternately has been tried out on a well-known British machine, but never came into much prominence. The double-chain system, one for each speed as on the Clyno, has superseded it.

CHAIN-BELT QUERY.

BERNARD J. LOGUE.—Write the Whitney Mfg. Company, Hartford, Conn., or the Majestic Mfg. Company, Worcester, Mass. We doubt if you can get such a transmission strong enough for your purposes.

BIG LANTERN PARADE.

AT its meeting, on August 29, the Indianapolis Motorcycle Club decided to give a big lantern parade which is to end with a banquet, sometime within the next two weeks. The board of directors was unable to give a definite report in regard to securing a clubhouse. However, those on the committee state that three good locations are being considered, and that it is very probable that quarters will be secured in a few days.

There was much interest in the 100-mile race that the club and the Indiana Racing Association is going to stage on Saturday, September 14. All the members promised their support for the venture.

Ray Hoffstatter has returned from New York, where he raced several times at Brighton Beach. Ray is a professional now, but is planning to compete in the 100-mile race here on his Merkel. Hoffstatter says he just wants to ride in the race and have a chance to break the professional record for dirt tracks. Under these conditions it is expected that Referee Kinney will permit him to ride on the track while the big race for amateurs is on.

DOVER CARD WELL RECEIVED.

C. R. BURBANKS, of New York City, thrilled a big crowd of race fans at Granite State Park, Dover, N. H., on August 24, when he turned off a mile on the dirt track in 55 seconds. This is the best time ever hung up for the course. Six races made up the card, and in each event the boys managed to put up an exhibition that won them cheers.

MOTORCYCLISTS in Trinidad, Col., have organized the Trinidad, M. C., and steps have been taken to affiliate with the F. A. M.

Keeping the BELT at its Best

How Frequent Cleanings Insure Maximum Mileage and Save the Rider Road Worry and Dollars.

GEORGE M. JOHNSON

THERE is a right way and a wrong way with almost everything, no matter whether it is driving a horse or hoeing potatoes. Sometimes to follow out the wrong method results merely in a lot of extra work and loss of time; in other cases it may mean actual financial loss. This last is above all true of motorcycles. A motorcycle requires more or less care and attention if it is to continue to deliver faithfully the exacting service expected of it. The motor itself, as the heart of the machine, will naturally suffer more quickly than any other part from abuse or neglect, but next to this, particularly in case of a belt-driven machine, the transmission must receive at least a moderate degree of care, or the belt will give constant trouble and be worn out before its time.

The Heavy Strain on a Belt.

The belt which drives a motorcycle has a pretty hard life of it. Just consider what it has to do, and under what conditions it works. It is traveling at an enormous speed, is crowded around a small pulley under fearful pressure, and little particles

of crushed stone are continually flying up from the road to be squeezed into the belt by the pressure of the pulley faces or lagging. Add to this the fact that the motorcycle may be used during a rain storm or on muddy roads where water, carrying fine sand, is constantly splashing over the belt, and it is not very difficult to realize why one occasionally goes

wrong, especially if the rider neglects to do anything to prevent it.

There are belts and belts. In my four years' experience as a rider of this type of machine I have made the acquaintance of both good and bad; but I have discovered that a reasonable amount of care is good for bad belts and not bad for good belts. It makes no difference whether your belt is flat or V; you must treat it decently if it is to deliver the goods. The wonder to me is, not that the motorcycle belt sometimes fails to give what is considered satisfactory service, but that it gives even fair service under such adverse conditions.

Leather Belt for Long Life.

There is one V belt that requires very little attention, and for that reason I should consider it quite desirable were it not for one defect. I am referring to the vulcanized rubber and canvas belt so popular a season or two ago. This belt never seems to need cleaning, it grips the pulley like a bulldog, seldom slipping noticeably even though quite slack, and has to be tightened only at infrequent intervals. So far so good; but the life of the rubber belt is at best a short one. From one thousand to fifteen hundred miles is about all one can expect—from my experience, at least—and that is too small a mileage figure for the price of the belt. The trouble is that this belt is built on the wrong principle. When it is forced around the small drive pulley, the outside stretches, while the inside buckles, which process tends to force apart the canvas and rubber. The latter peels away from the side—and then a new belt.

The leather V belt as now made gives more satisfactory service. To be sure, it does not grip quite so well as the rubber, especially when wet, and therefore must be run tighter, but it lasts longer. It does, however, require regular attention. In the first place, the sides of the belt, where pressed against the pulley faces, often take on a hard gloss or polish which destroys the gripping power. This is formed mostly of small particles of dirt and road material which combine with a little oil from the engine or dressing from the belt to form the hard surface. This does more than merely rob the belt of its gripping power; if the scale is not removed, it has a fearful effect on the pulley faces, quickly grinding

them out of the correct angle of 28 degs., which is another very strong reason why attention should be given at the right time. To fit a new belt to a pulley with badly ground out faces is to shorten by half or even more the life of your new belt.

Pointers on Cleaning.

This scale may be removed by aid of a very dull knife—one at all sharp is likely to cut and mar the belt—and if the rider is in a hurry it may be done without taking the belt from the machine. I have often stopped to do it on the road, when I found my belt slipping, even though tight enough to transmit the power in good shape. That, however, is only a temporary arrangement, and once in so often—say every five hundred miles, or oftener if the leather needs it—the belt should be removed from the machine and thoroughly cleaned.

Scrape it very carefully, being sure to dig out every tiny bit of crushed stone that may be sunk into the leather; and you will be surprised to find how many of these there are. Then clean out thoroughly around the little blocks on the under side, which allow for that buckle effect as the belt is crowded around the small pulley. You will probably find a big supply of dirt collected here. After the scraping operation is completed it is a good plan to rub the belt with a woolen cloth. Use plenty of elbow grease, and you will remove a lot more dirt; never clean a belt with gasoline, as that is very detrimental to the leather, and bad practice.

Neats-Foot Oil as Dressing.

If the belt is riveted—and most leather V belts are—with large washers on top to prevent the belt from sinking too far between the pulley faces, you should take a look at the condition of these rivets and washers. You may find some of the latter missing, or about to fly off, and if so, replace those that have departed and anchor the others more firmly by a few light taps of a hammer. Next it is time to dress the belt with some good preparation that will keep it soft and pliable.

There are a good many belt dressings and leather preservatives on the market, and they may be all right—I cannot say, since I have tried none of them. But I do know that neats-foot oil is all right, and I know that certain belt makers recommend it. I have used neats-foot oil many times on hunting boots and on my motorcycle belts, and have been entirely satisfied at the results. Applying the oil is rather a messy job, but no motorcyclist should mind a trifle like that. Coil the belt up in a flat basin or pan, and pour at least a pint of the oil—a quart is better—over it. Tip the pan this way and that, so that the oil can run all over the belt, in and around the blocks or interstices, as the case may be. After it has soaked awhile, turn the belt over, and give the other side a chance. It is not a bad plan to let the belt remain over night in the oil bath.

Belt Must Be Pliable.

When it has soaked long enough, hang it up over the pan to drain off the superfluous oil, which can then be put away for use the next time. Get busy with your hands and rub the oil into the leather by twisting and turning the belt. You will soon notice that it is far more pliable than before treatment. Then rub off all the oil you can with rags or cotton waste, and your work is done. At first you may find that the belt slips unduly because of the oil squeezed out on the pulley, for leather soaks up a good quantity of neats-foot, but this lasts only a day or so. You will be well repaid for your trouble by having a belt that drives better and lasts longer than if you had neglected it.

A flat belt requires treatment of this kind just as much as a V, though not so often. Yet where a flat belt is used with hand idler in lieu of a free engine clutch there is extra need of care, for the slipping belt is burned and polished by the friction. The driving surface of a belt should never feel harsh and dry, but should be slightly greasy to the touch; never use a belt—flat or V—when it is dry—that is, when the oil or dressing has all been burned out of the leather. In such a condition it will crack and break very quickly and soon be ruined beyond hope of repair.

An Extreme Case.

The flat belt should always be cleaned and dressed after being wet. If the machine is driven during a hard rain or over very wet roads, a good deal of water will get on the belt. After the ride the belt should be carefully scraped as described for the V belt, until all particles of sand and gravel are removed. If the belt is in very bad shape it will be well nigh impossible to do this without some preliminary treatment.

Not long ago I undertook the worst ride of my experience—sixty-five miles of mud and water from four inches to a foot in depth. Next morning I started in to clean up, and found the belt in fearful shape. It was as hard as a board, and its surface would have made a fine rasp—simply covered with sand and gravel sunk into the leather. I tried to scrape it, but there was absolutely nothing doing. Then I removed the belt and gave it a good soaking in neats-foot oil; that softened the leather until I had no more trouble in scraping out all the bits of embedded stone. I next gave another dose of neats-foot, and allowed it plenty of time to soak in. To finish the job I let the belt drain; thereupon wiped it as dry as possible, and now the belt is just as pliable as when new; but had I attempted to use it with no attention after that ride it would surely have been ruined.

A SPEEDY MOTOR-COP.

SOME time ago Webb Redner, a motorcycle officer in Kansas City, Mo., decided to transform his rigid-frame Merkel machine into a racer in order to put a crimp in the opera-

tions of speeding automobilists in his district, and the outcome is the machine shown in the accompanying photograph. Redner has fitted a model H Heitger carburetor of the racing type and made other changes in his mount, with the result that few speed fiends manage to elude him. He has brought in enough money in fines to pay his salary for sometime past. The photograph is forwarded by E. J. Cortines, agent for Merkel machines in Waco, Texas.

LONG TRIP FOR WITMER.

LONG distance riding is more and more being indulged in, and Claude Witmer, of South Bend, Ind., is a recent convert to the habit but by no means a dabbler. He left South Bend on August 11 and will cover 6,000 miles of roads, including the following cities in his itinerary: New York, Chicago, Omaha, Lincoln, Neb., Denver, Salt Lake City, Spokane, Seattle, San Francisco and Los Angeles. The roads encountered will satisfy the most ardent road-driver as regards experience, including mountain, desert, mud, etc.

A YOUNG business man of Waco, Tex., a motorcycle enthusiast, recently rode his motorcycle on an annual trade "boosting" trip of the Young Men's Club of the Board of Commerce. And with his motorcycle he kept constantly ahead of the special train carrying other "boosters."

McBRIDE'S RECORD.

IN spite of the fact that he was greatly held back by the lack of deliveries last spring, Percy A. McBride, the popular Toronto salesman, has enjoyed a great run of business this year. "Mac" had sold over one hundred motorcycles on August 1, seventy-five of which were the Excelsior brand. Fifteen more sales were Pope machines and ten were Motosacoche.

A recent big order which McBride secured was from the Hydro-Electric Commission for six Excelsiors. Four or five different makes had been tried out by the Commission, but the Excelsior was finally chosen as the standard equipment of the department.

Harold Cole, the young Canadian racing star, is now a free lance, having left McBride's employ. Cole expects to go to Chicago to take up employment in the Excelsior factory unless some other agent signs him up for racing.

A MOTORCYCLE HONEYMOON.

NOTHING is more romantic than a motorcycle honeymoon trip, according to Mr. and Mrs. Clinton Johnson, who just completed a 1,500-mile journey from Topeka, Kan., to El Paso, Tex.

CITY officials of Beloit, Wis., are opening a campaign to fine motorcyclists who ride with their mufflers open.

MOTORCYCLES are to be adopted for the use of officers in the government forest reserves in California.

SHERIFF MISCHKE, of La Salle county, Ill., has adopted a motorcycle for use in apprehending all classes of criminals.

THE Brockton, Mass., Motorcycle Club recently conducted a successful Sunday afternoon run over 138 miles of sea coast road.

ARCHIE OLBERG and Ed Schwalbe, of La Cross, Wis., recently toured to Fremont, Neb., and return, a distance of 1,500 miles, in six days.

WILLIAM KAPPMEYER, of Aberdeen, S. D., is making a trip on his motorcycle, to Alton, Ill., and return, a distance of 2,500 miles.

MEMBERS of the Rochester (N. Y.) Motorcycle Club recently made a trip to Hammondsport and the Curtiss aviation field, where they were entertained by Glenn Curtiss.

THE plumbing inspector of Terre Haute, Ind., makes his rounds on a motorcycle.

MR. and Mrs. Samuel Switzer have completed a trip from Moline, Ill., to Minneapolis, Minn., on a tandem motorcycle, a distance of 750 miles.

THE members of the local motorcycle club, of Porterville, Cal., headed by President Shortman, recently toured to Tule River.

GEORGE M. FULLER, of Long Beach and Miss Gertrude Edwards, of 1407 East Fifty-sixth Street, Los Angeles, Cal., who were married a short time ago, went to the minister's on a motorcycle.

OUR big annual endurance run was over a course in the "west cuntry" this year, and covered most of Devon and Somerset, counties notorious amongst roadmen for their bad surfaces, terrific gradients and blind corners. The general results were a trifle mixed, as only 80 machines out of 126 starters succeeded in completing the course; yet those 80 performed brilliantly. The apparent paradox is instantly soluble by anybody who knows the ropes. Motorcycling is booming in England. Any fifth-rate engineer who has a few dollars of capital scents the chance of making a pile, and rushes into the designing and manufacturing business. He wants to get customers and rake in shekels before he can be sure he has got the goods right, and so he seeks a premature publicity by competing in trials when his experimental machines are really only half-baked. Add to this the fact that there is always a sprinkling of accidents, that somebody is sure to encounter real hard luck, and that there are not 125 riders in the country who are first-class jockeys and also first-class mechanics, and the percentage of failures is easily explained.

Veterans Not Bothered.

The decent riders who had decent machines jeered at the formidable gradients dished up by the promoters. There were many miles of single-figure gradient included in the course, and the rain practically never ceased from Monday morning to Saturday night; yet on an average the machines showed a consummate mastery of the gradients. This was of course mainly ascribable to variable gears, of which an analysis is appended.

Solo Machines.

Type of Gears.	Started.	Finished.	Percentages.
Epicyclic hubs	47	31	66%
Countershaft 2-speed	35	22	63%
Countershaft 3-speed	3	3	100%
Variable pulley gears.....	11	7	63%
Epicyclic engineshaft gears.	5	1	20%

The two latter types of gear performed worst on the hills, because their bottom ratio is limited by factors of design, whereas a man with a hub or countershaft gear can easily obtain a low ratio of 12 to 1, if circumstances demand it.

Passenger Outfits.

Twenty-two passenger machines started, of which exactly half finished, eight securing perfect scores. The passenger outfits included the following types: Single-cylinder, 3-speed motorcycle and side-car; 3 started, one finished, securing a gold medal; twin-cylinder,

multi-speed motorcycle and side-car; 12 started, 7 finished; securing 5 gold medals, one silver, and one bronze; four-wheeled cyclecars, with friction disc drive; 2 started, one finished; securing a gold medal; single-driving two-seated tricycle, with chain and gear transmission; three started, two finished; securing one gold and one bronze medal; four-wheeled cyclecars, with gear drive; 2 started, neither finished.

Where the Trouble Came In.

The main trouble with all these light passenger outfits was to secure adhesion of the back tires on greasy gradients, for want of which much time was lost and many marks were sacrificed. The rules stated that all hills must be climbed with the passenger "seated in a normal position," but these regulations were frankly ignored. The side-car passengers had to be as lively as kittens; they hitched their toes into the carrier stays, made their bodies rigid as pokers, and leaned their heads a yard overboard on bad corners, in spite of which there were several turn-turtles; on straight gradients they clambered bodily out onto the carrier to hold the driving wheel down. The Morgan cyclecar had a huge portmanteau full of stones strapped over its back wheel, and even then its crew got as far astern as possible.

Some Novel Stunts.

The G. W. K. four-wheeler wrapped rope round its driving tires, and so fared better than most. Colver imitated this dodge on his Enfield sidecar outfit, but the sharp stones cut the rope through, and he came to a standstill with 12 yards of clothesline inextricably entangled in his back hub—and so on. The above statistics are too mixed to prove the technical superiority of any particular type, but if I may venture a personal prophecy, the motorbicycle with three-speed countershaft gear is the coming solo mount, and the passenger market will be divided between multi-speeded twin-cylinder outfits and the cream of the four-wheeled cyclecars.

A Gymkhana in the Mud.

Towards the end of the week the weaklings had mostly been eliminated, and the 85 starters on Saturday morning were mostly going strong for a perfect score and gold medals. They had reckoned without the clerk of the weather. The ride opened with 15 miles of lanework, followed by a ten-mile non-stop, designed to make everybody tackle the infamous Porlock Hill with a hot engine. Porlock Hill is a sufficiently terrible climb when the road

is dry, but rain had fallen steadily all week. The hill is two miles long, and its crux consists of a 200 yard stretch of 1 in 6, half way up, beginning and ending in fearsome elbow-crooks, each claiming a grade of 1 in 4.

The surface is always bad, for ordinary traffic climbs the ridge by a beautifully engineered toll road, taking five miles instead of two; so the old road is never repaired, and at its best is a broad smear of loose red dirt, deeply rutted by descending carts. But for 28 hours floodwaters had been flowing steadily down between the rock banks, and the red dirt had been churned into a red sea, in which a car would sink to the axles, and a motorcycle would drop anything from four to twelve inches. I had telephoned the boys overnight what the road was like, and before entering the non-stop section the 3-speed hub men screwed down their engine pulleys to $6\frac{1}{2}$ to 1, which meant a bottom ratio of 13 on the hub.

That Terrible Climb

Entering the village there was a half-mile drop, and they coasted down this on low gear with their valves up to chill their engines. The rules say you lose 50 marks for touching the ground with your foot for any purpose in a hillclimb, but rules and penalties were soon forgotten. As soon as the front wheels struck the quivering quagmire, every man's foot shot out automatically; it was the only hope of keeping vertical. Plunging, slithering and sliding in all directions, with thrusting feet and aching wrists and frenzied faces the men tried to coax their unmanageable machines up the fierce gradient. One machine rushed clean off the road into a quarry; another fell over the bank and down into a thicket; numbers got their front wheels at right angles to the frame, and lobbed gently over sideways; some skidded heavily; two or three rammed the rock wall; one tried to climb a steep bank of heather at the roadside with a gradient of 1 in 2, and his machine went half-way up in its rush before it fell back on him; a Zenith rider skidded clear round, and went down the hill, then he had another skid, and came up again a few yards before his engine croaked out. Altogether only 24 out of 85 went up, and these more by luck than judgment.

Indians in the Trials

Four Indian machines were entered in the trials: the London depot of the Hendee company entered two 7 h. two-speeders, ridden by John F. Sviett and B. Alan Hill, and a $3\frac{1}{2}$ h. ridden by A. H. Alexander; while E. D. Dickson, a Cambridge undergraduate, entered his

privately owned 7 h. Alexander's $3\frac{1}{2}$ h. was overgeared for the job, and fell out at mid-week; having no spare sprockets, he could not lower his ratios. The three 7 h. machines all secured gold medals, but Alexander's defection put the team prize beyond their grasp. None of them was able to climb Porlock Hill, a fact which will tell American riders that I am not exaggerating its difficulties. The explanation of their failure is interesting: there were 17 high-powered twins, of from 5-8 h. in the solo class, all with variable gears, and only two, a 5 h. A. J. S. and a 6 h. Brough, got up Porlock; the faster and heavier the machine, the more unmanageable it proved in the red porridge.

Where the Prizes Went

Special prizes for Porlock Hill: Solo, Evans $3\frac{1}{2}$ h. Humber; passenger outfit, Morgan, 8 h. two-seated Morgan tricycle; slowest hill-climbing; solo, Baker, $3\frac{3}{4}$ h. Scott two-stroke; passenger outfit, Tassell, 7 h. Matchless side-car; best amateur hill climbing; solo, McMinnies, $3\frac{1}{2}$ h. Triumph; passenger, H. M. Jamieson, 6 h. Enfield and sidecar.

Trade team prize, three machines; first, Phelon and Moore (Pratt, Shaw and Drake), $3\frac{1}{2}$ h. chain-driven two-speeders, double friction clutch gear on bottom bracket counter-shaft; second, Rover (Newsome, Noble and Sproston) $3\frac{1}{2}$ h. belt drivers, with Sturmey-Archer three-speed epicyclic hub; third, James (Arter, Pollock and Brown) $3\frac{1}{2}$ h. chain-driven three-speeders, with sliding counter-shaft gear box.

In the Gold Medal Class

Gold medals: Rover (3 machines out of 3); Phelon-Moore (4 machines out of 4); A. J. S. (5 machines out of 5); Triumph (4 machines out of 7); Ariel (2 machines out of 3); James (3 machines out of 3); Scott (3 machines out of 3); L. M. C. (3 machines out of 4); Brough (1 out of 1); Humber (1 out of 4); Rudge (2 out of 6); Indian (3 out of 4); Motosacoche (1 out of 1); Premier (3 out of 5); Bradbury (2 out of 10); Swift (2 out of 2); Zenith (2 out of 5); New Hudson (2 out of 3); Precision (1 out of 1); Singer (1 out of 2).

Passenger machine gold medals: G. W. K. cyclecar (1 out of 2); Enfield side-car (2 out of 3); Morgan tricycle (1 out of 1); Clyno side-car (1 out of 1); Matchless side-car (1 out of 4); A. J. S. side-car (1 out of 1); Bradbury side-car (1 out of 1).

The Silencer Trials

The much-heralded muffler trials have resulted as inconclusively as everybody expected. What the governing body considers a reasonable degree of silence was obtained by using a muffler box of a volume equal to the cubical capacity of an engine multiplied by ten. This muffler is used as an expansion chamber, and the gas is conducted from it down a long straight open-ended pipe, extending to the rear of the machine. The Auto-Cycle Union has requested the trade to design their mufflers so as to secure this degree of silence, but there is no room on a $3\frac{1}{2}$ h. machine for an exhaust expansion chamber with a volume of 5,000 c.c., nor are the long rearward pipes likely to be popular.

In the 1,000 miles trial several machines used these long extension pipes, in conjunction with a standard muffler box, the latter being employed as expansion chambers, but if the machines were silent as they approached an observer, they were noisy going away from

him, the long pipes merely serving to convey the noise backwards. The Indians were far and away the most silent machines in this trial. The judges sealed all the cut-outs with flexible wire, and after the first two days the competitors stretched the wires with pliers, and opened their cut-outs at will.

THE COLUMBUS SITUATION.

COLUMBUS, Ohio.—A number of causes contributed to an action instituted in the local courts recently which threw the Columbus Motordome Company into the hands of Receiver Jerry O'Shaughnessey. The action was the result of pressing creditors who clamored for their bills, and Jack Prince, the builder of the saucer, brought the action in a friendly spirit. It precluded the naming of an unfriendly receiver. W. H. Snyder, who has been general manager of the motordome since its construction, and whose management is satisfactory, will continue in that capacity.

The principal cause for the failure of the project is the lack of street car service given by the Columbus Railway & Light Company. It was unfortunate that in order to get a sufficiently large level spot to erect the track it was necessary to go out such a distance from Columbus that the street car service was not the best. The street car company has refused to construct a spur to the track from the terminal of its Arlington line until assured that the Columbus public will support racing on the saucer. Another cause for the failure is that professionals of widespread reputation were brought here at great expense and that there was not a sufficient number to insure competition. It is the opinion of Mr. Snyder that what the people want is amateur racing if the fields are large and the racing close. In the future the races will be confined to stock machine riders.

President O. F. McClain, of the Indianapolis Club.

MILWAUKEE SENTINEL RUN.

MILWAUKEE, Wis., September 2.—Forty-one riders finished a three-day grind over the worst roads in Wisconsin in the Milwaukee Sentinel endurance run tonight. Each of the men who completed the tour under his own power will be given a medal. The recent rains put the roads in very bad condition and the riders were glad to hit town. One hundred and fourteen started in the run on Saturday morning. The first day's run of 97 miles was to Madison. Four of the contestants dropped out and the others checked in on schedule time. Leaving Madison on Sunday morning, the run to Oshkosh, a distance of 103 miles, was made. On this leg the motorcyclists met with their first real hardships. During most of the day they rode through the pelting rain and many dropped out before night. The riders were scheduled to arrive at Oshkosh at 6 p. m., but the first man did not get in until after 8, and from then on the others straggled in. It was 11 o'clock when No. 80, the last rider, was checked.

Nearly 20 dropped out. The riders left Oshkosh on Monday morning minus 13 more contestants, who shipped their machines by express and took the train back home. Leaving Oshkosh the riders ran into a cloudburst and crawled along through the mud. The roads in this section are the worst in Wisconsin; in many places the men had to walk and push their machines. The first arrived here at 7 p. m. and the last at 10:30. Miss Lillian Slaughter's machine was disabled 10 miles out of Oshkosh on the second day's run, and she was compelled to wait. Miss Lawler kept on, however, and arrived with the first batch of riders. She was covered with mud from head to foot. Another run for Sentinel medals will probably be made next year.

WILLIAMSPORT PICNIC.

SEVENTY-FIVE motorcyclists of Williamsport, Pa., gathered at Big Run on August 25 where William A. Myers, Indian, Excelsior and Thor dealer in Williamsport, tendered his annual picnic. Most of the machines left the city about 9 o'clock and by 10 o'clock the majority of Mr. Myer's friends reached the little grove of trees at Big Run, where the picnic was held. The refreshments were taken to the grounds on a big float which was fastened to a launch.

RUN TO THE SHORE.

PHILADELPHIA, Pa., September 2.—The Harley-Davidson Motorcycle Club of this city held a run today to Stone Harbor, N. J., via Millville, Cape May Court House and Vineland. On account of the races which were held on the beach at Stone Harbor it was necessary for the men to camp over night at the shore.

AN EASTERN TOUR.

ZANESVILLE, Ohio.—R. B. Williams, H. J. Hoppstetter, R. S. Cosgrove and "Bonnie" Phillips, left Sunday, August 18, for a 2,000 mile motorcycle trip throughout the east. The intention is to travel eight states of the Union and to spend the time in sight-seeing. Messrs. Phillips and Williams are riding tandem on a T. T. Indian.

CHESAPEAKE OUTING.

BALTIMORE, Md.—The boys of the Chesapeake M. C. went up to Harpers Ferry and Halltown, W. Va., on Sunday, September 1, making the third long jaunt the members of this club have taken this season. An early start was made and the going was excellent.

GIRL LEAVES FOR THE COAST

Miss "Cy" Woodman, Mounting Flanders 4, is Given Rousing Send-off at New York City Hall as She Begins Trip to the Golden Gate—Now Headed for Chicago.

UNDER fire of several motion picture machines and surrounded by a mob of well-intentioned but excitable folk of both sexes and all stations in life, Miss "Cy" Woodman, erstwhile newspaperwoman, lecturer, globe-trotter and broncho-buster, swung into the saddle of her Flanders 4 at the City Hall in New York at 3 p. m. on August 30 and began the first leg of what she hopes will be a journey to San Francisco. She spent Friday night at Yonkers and is now on her way to Chicago.

When it is stated that Miss Woodman started her trip at New York City's seat of government—still so referred to despite the newspapers—it must not be inferred that she hopped aboard her machine and chugged blithely out of the metropolis. Far from it. The crowd wouldn't have it that way. While the moving picture men were still grinding away at their merriest, and Miss Woodman was fastening a small silk American flag to her handlebar, two policemen, who happened not to be testifying in graft investigations, appeared on the scene and insisted that if the rider expected to reach San Francisco an early start wouldn't do any harm. They explained that traffic was being tied up in front of the City Hall and that several people in Broadway and Park Row were waiting for a chance to get through. Accordingly Miss Woodman started.

The Official Start.

With her motor purring encouragingly she let in her clutch and traveled nearly fifty feet. Then the crowd closed in on her, a solid wall, and she stopped. Upward of 500 men and boys were shouting farewells and advice to her and even the herculean efforts of E. C. Kicherer, of the Sun Motor & Supply Company, agents in New York City for the Flanders, could not open a path for the machine. Mr. Kicherer was here, there, everywhere, with

the celerity and unfailing good humor of a seasoned stage manager, but he could not arrange for the rider to proceed without climbing a stiff grade over a few portly business men. The machine was finally wheeled into Broadway and the crowd went with it. Riding a few feet at a time and then pushing a few more feet Miss Woodman reached Chambers street and turned off Broadway. So did the crowd.

Out of the heaviest traffic Miss Woodman mounted again and half a thousand boys, suddenly stricken with motorcycle fever, ran on both sides of her, behind her and in front. She traveled several blocks before the crowd closed in again. Then some one struck her handlebar and she went down, but scrambled to her feet uninjured. She had traveled less than a quarter of a mile, and the hardships of a trans-continental trip were being fully impressed upon her. Her struggle to make headway had tired her considerably but her nerve was still intact and it was with reluctance that she agreed to Mr. Kicherer's proposition that she proceed uptown in a taxicab while her machine was ridden by one of the Sun company's mechanics.

Motion Picture Men Get Busy.

At Columbus Circle the prospective trans-continentalist again took charge of her machine and rode it to and fro while the motion picture men turned their mysterious little cranks to their hearts' content. Then she proceeded to the headquarters of the Sun Motor & Supply Company, at 307 Amsterdam avenue, made a few final adjustments and set out for Yonkers. All things considered the start had been an auspicious one, although a severe test of the rider's pluck.

Miss Woodman names Philadelphia as her home city, but for years past she has been en-

gaged in newspaper work in New York. Prior to her arrival in the metropolis she had traveled considerably and had spent enough time in the West to establish a reputation as a daring equestrian. Her interest in the motorcycle dates back only about three months. It first manifested itself after friends had persuaded her to abandon aeroplaning aspirations. Having once taken to the motor two-wheeler Miss Woodman—"Cy" is a pen name, by the way—decided that it offered her a business opportunity, her business being to transform experience and adventure into coin of the realm, and in that way the plans for the cross-country trip were taken up.

A Nervy Undertaking.

The undertaking is a personal one. While the New York representatives of the Flanders company assisted the rider in every way possible they are not directly concerned in the enterprise. It is the rider's intention to defray expenses along the route by selling postcards, showing her on her machine, and by giving lectures and writing of her experiences for newspapers in the larger cities through which she will pass. She has also been given to understand that a theatrical contract will be waiting for her in New York if she succeeds in completing her journey to the Golden Gate. Before leaving New York Miss Woodman entered into an agreement to write a serial story of her trip exclusively for *MOTORCYCLE ILLUSTRATED*, as far as the motorcycle field is concerned. Other articles from her pen will appear in half a dozen recreation and sporting publications.

When she left New York Miss Woodman wore a snug-fitting khaki jacket, a short khaki skirt and knickerbockers. Tan puttees and tan shoes, the latter showing only slight concessions in the matter of heels, completed her riding outfit except for a heavy green motor-

ing cap, the flaps of which were pinned down over her ears. For the first leg of her journey the rider is carrying only a valise, strapped to her luggage carrier, and her supply of spare parts is scanty. Later she intends to exchange the valise for a suitcase and increase her lay-out of parts. Her route to Chicago was mapped by the officials of the Automobile Touring Club in New York and the club's Chicago branch will map the remainder of the trip, if the rider reaches the Windy City still in a mood to continue her cross-country jaunt. New York motorcyclists told her that she will be putting up a remarkable performance if she reaches San Francisco in 80 days, but she took to the road with full confidence in her ability to make the trip in 50 days. Those more conservatively inclined believe she will be doing all that can be expected of her if she reaches Chicago.

On leaving New York Miss Woodman entertained no doubt as to the outcome of her undertaking. She listened to stories of abandoned trails, roads hub deep with gumbo, stretches scores of miles long which must be ridden on railroad ties, countless streams which must be forded and mountains to be topped and then remarked that, barring broken bones, she was bound to get through. Pluck of this brand demands some consideration, and metropolitan motorcyclists will be glad to see the little lady make the most of her fighting chance.

BIG RUN SCHEDULED.

OFFICIALS of the Angel City M. C. of Los Angeles, Cal., have about completed plans for an endurance run which promises to be the longest on record in this country. The course will lead to Oakland in such a way that many hills and stretches of bad roadway will be included, and the riders look forward to a grind that will go down in motorcycling history on the coast. The members of the Oakland Club are to act as timers, checkers and other officials, and they will also care for the machines of the endurance riders while they are in Oakland. The new address of the Angel City Club is 433 Fifteenth street.

A SUCCESSFUL run to Ft. Wayne and return was recently conducted by the Goshen (Ind.) Motorcycle Club.

CENTRAL JERSEY RUN

Trenton Riders Cover 200-Mile Route and Seventeen Finish Within Schedule Time.

TRENTON, N. J.—The 200-mile endurance run of the Central Jersey M. C., which was postponed from August 11, was held on August 25, when 25 riders took to the road for the long grind. The starting list was made up as follows: W. Albert, Excelsior; Levi Holmes, Harley-Davidson; J. Petry, Harley-Davidson; F. C. Molnelt, Flanders; Joe Tietz, Thor; A. Bethke, Reading Standard; Frank Ketterer, Indian; Leon Richmond, Indian; Waddock Obeski, Indian; Abe Bernstein, Reading Standard; Parker, Sweet, Harley-Davidson; Howell, Scarborough, Harley-Davidson; A. Dunham, Harley-Davidson; James M. Fenton, Harley-Davidson; E. S. Soltner, Harley-Davidson; William Cooper, Indian; David Marshall, New Era; Albert Shaw, New Era; Robert Fitzgeorge, Indian; G. A. Frounfelker, Indian; Ernest Henk, Indian; E. F. Lamson, Indian; F. H. Arent, Indian; Leon Pellenger, Harley-Davidson, and Russell Vandergraft, Harley-Davidson.

The finishers were: Lamson, Frounfelker, Fitzgeorge, Cooper, Soltner, Fenton, Sweet, Dunham, Scarborough, Obeski, Arent, Holmes, Petry, Molnelt, Tietz, Richmond and Leon Pellenger.

The route was as follows: Trenton to Pennington, to Ringoes, to Flemington, to White House, to Clinton, to Washington, to Beattystown, to German Valley, to Morristown, to Chatham, to Springfield, to Newark. The return was via Elizabeth to New Brunswick, to Old Bridge, to Matawan, to Freehold, to Hightstown, to Cranbury, to Dayton, to Monmouth Junction, to Brunswick Pike and into Trenton.

SWELLING THE RANKS.

RURAL mail carriers in Fairmount, Fowler, Crawfordsville and Mooreland, Ind., have joined the ranks of progressive mail carriers and are delivering their mail on motorcycles.

IT is expected that a \$10,000 motordrome, to be erected in Chattanooga, Tenn., will be completed before the winter sets in.

FIRST SOCIAL RUN.

BALTIMORE, Md.—The Maryland M. C. successfully pulled off the first sociability run held in this section on Sunday, September 1, and so enthused are the members over it that it has been decided to make it an annual feature. The starters numbered about forty and the distance covered was well over a hundred miles. There was only one checking station and that was at Emmitsburg, the turning point. Westminster, Frederick, Ridgeville and Ellicott City were the places the boys were compelled to go through. Those with the odd numbers went to Frederick first and those with the even numbers went through Westminster first, so that the boys were passing each other at different times during the day.

About thirty finished within the time limit. There were several bad spills and breakdowns on the way but no one was injured. A number of prizes were offered.

RACING AT ISLE OF PALMS.

NEARLY 4,000 people recently witnessed a twenty-mile motorcycle race at the Isle of Palms, Fla. The starters were M. S. Sullivan, Indian; John Bulwinkle, Indian, and T. C. Smith, Flying Merkel. Smith carried away the prize, finishing in 26:30; Bulwinkle was second, 33:20, and Sullivan third, 38:15.

VIEWED BEAUTY SPOTS.

BALTIMORE, Md.—A large number of the members of the Maryland M. C. spent Sunday, August 25, in the mountains inspecting the beauty spots to be found around Pen Mar. Buena Vista and Monterey on the crest of the Blue Ridge.

BACK FROM FOREIGN TOUR.

DR. J. E. Clark and Ross Arthur, of Streator, Ill., are back from a European motorcycle tour. They visited England, France, Scotland, Switzerland, Holland, Belgium and Italy.

SHERIFF MISCHKE, of La Salle County, Ill., has purchased a motorcycle, which is to be used in chasing criminals, serving writs, warrants, and other official papers.

Start of recent run of the Central Jersey Motorcycle Club, of Trenton, N. J.

Through MUD and SAND in SOUTH CAROLINA

More Work Than Recreation In a Trip Over Inundated Roads, Swamps, Etc., In Southern Part of the State—Wash-outs and Numerous Other Obstacles.

by JOHN C CROMER

Bridge Was Washed Away.

AS soon as the warm sunshine of last spring had begun to dry up the muddy roads, I started in to tune up my motorcycle for a spin of some 150 miles, to visit relatives living in the lower part of South Carolina, near Waterboro. My mount had been caged for several months, with scarcely enough exercise to keep it limber, but it was apparently in good trim. I knew that fifty or seventy-five miles of this road would be deep sand, but I was very anxious to make the trip and was willing to trust to the ability of my machine to get through without serious trouble. I packed my wardrobe in a small handbag and placed it in a rack (my own make) in front of the handle bars. I was joined by I. T. Timmerman, a friend who had made a recent purchase of a single cylinder. Though he had but little experience, he was an enthusiast.

On May the 20th we left Newberry, S. C., our home town, very early in the morning. The weather was fine and we clipped off the first twenty miles in good time. Then we found a stretch to negotiate, thirty yards of which seemed to require as many minutes. Mudholes nearly knee deep extended clear across the road, and embankments on both sides made it impossible to go around. After a mile or two of this kind of road you could hardly tell my gray Wagner from Timmerman's blue Indian, and as for our own appear-

ance—well, it's too early to describe that. Fortunately, after a mile or two conditions improved. From Lexington the road was excellent all the way to Columbia. Here we replenished our gasoline supply and set about to inquire the roads to Orangeburg. There are two routes, one on the west side of the Congaru river, which is the most direct, but very sandy and swampy. The other was on the eastern bank, a hard clay road crossing at Bates ferry to the west side. This was a very much longer course. Timmerman, wiser than I, deserted me here. I had no difficulty in finding the right road, which was built of hard clay. I ran my motor to the limit of its speed capacity, and began congratulating myself for selecting this route when, at a turn in the road, I came upon a pond of water about thirty yards wide. The only means for crossing was a foot log three feet from the ground. The water did not seem to be over eight inches deep, so I decided to ride my motor through, and, going back some distance to get a start, I came up at about a 20 mile clip. Half way, my motor stopped, and I had to get down and drag the machine out, which proved to be no small task. But I managed somehow to do the stunt, and after a little coaxing soon had the motor going again, speeding for the river which was now only a few miles off.

There are two spurs of the river, divided by an island. The first is spanned by a bridge, the other crossed by a ferry, but recent heavy rains had completely washed the bridges away. It seemed that my journey had come to a sudden end. It was 35 miles back to Columbia, the only other place where I could cross back to the west side, and that road was considered almost impossible. A very discouraging situation indeed, but I was determined not to be outdone by circumstances, so I procured a batteau and hired a darky living near to row me over.

We crossed the channel in safety and landed in mud only two feet deep. It required some hard work to get my machine upon hard ground, and then my troubles had just started.

The island was about two miles across and traversed by ten or fifteen small streams, the bridges across which had been washed out of their places. Trees were uprooted and strewn across the highway, and great washouts here and there made the road almost impassable, even for an unencumbered pedestrian. A small boat and a ladder would have better fitted me for this expedition. I lugged and toiled though, lifting my machine over trees, wash-

A Handy Row-Boat.

outs and rifted bridges until I had penetrated about a mile of this awful jungle. Then I left my machine and walked to see if conditions were likely to improve but found little consolation. I returned to my old mount, not willing yet to abandon it, though I was fatigued, as it was very hot. My watch was pointed to an hour far beyond the time for square meals, and no relief was in sight. Not a cheering sound could be heard, not even the bark of a dog. There were scarcely any signs that a vehicle had ever traveled this way. The afternoon was fast passing away and to spend a night in this desolate region was not at all a pleasant prospect.

I worked my way a little at a time and finally, after more than three hours of hard work, I emerged upon the other river bank. Fortunately I found an old darky nearby fishing from a little boat. I hired him to put me across. He landed me in drifted sand about knee-deep and I gave him a quarter to help me push my machine fifty yards.

I felt very much encouraged now by the fact that I was off the island, but I still had several rifted bridges and deep washouts to cross. I managed to get over them and once more on good roads. I repaired to a little village called Fort Mott, where I obtained food and refreshments.

My next stop was Saint Matthews. I found

the roads excellent and on down as far as Orangeburg. I replenished my gasoline supply and made my final dash for Branchville, the last town of any size I expected to pass.

After leaving Orangeburg the roads for seven miles were good. Then I came into the sandy region. This, of course, retarded my progress, but I made pretty good time, reaching Branchville a little before 6 o'clock. I was now 25 miles from my destination and I had feared that this would be the worst part of my journey. It was bad but I found my worst trouble was keeping to the right road. I had decided to go by a little village called Smoak's and thought I might reach that place by dark, as it was only 12 miles distant. Automobiles are unknown here and motorcycles attract as much attention as a flying machine would, so it is not difficult to get lost when you leave the railroad. However, I set out from Branchville at about 6.20 o'clock and had no trouble for about five miles. Then the road forked. I consulted my map and found nothing to indicate another road there. Of course, I took the wrong road, but did not find that out until I had traveled seven or eight miles. I decided then to give up the attempt for the present, having learned that a white family lived in the neighborhood. When I asked about lodging for the night, they assured me that I was welcome.

I had traveled 149.4 miles since leaving home, which was far better than I had expected. The next morning, much refreshed, I resumed my journey. Though the roads were still sandy, I soon came to the end of my jaunt, 159.6 miles. On my return I took a different route, and had no trouble whatever, making the run in a little more than eight hours.

WON \$500 PURSE.

IRA ALBERT (Harley-Davidson) carried off the victor's purse of \$500 in a five-mile race at Waverly, Iowa, recently, coming in 100 feet ahead of his opponent, Elmer Dietz (Thor). This was the second race between the two men, the first having been won by Dietz.

George M. Johnson, One of Our Contributing Editors.

A FAIR RIDER'S OPINION

MISS DELLA HOHL, of Indianapolis, Ind., is a full-fledged motorcycle enthusiast, who believes that the sport should be enjoyed by both sexes. She says her machine is easily operated, clean and silent, and believes that a woman can ride a motorcycle without sacrificing her dignity in any way.

"The efficiency and economy of the modern motorcycle have made it a necessity in business," says Miss Hohl. "They have also combined to open a new world of pleasure for those seeking recreation."

AN ALABAMA MEET.

SIXTEEN motorcycle events will be held at the Alabama State Fair in Birmingham, from October 3 to October 12. Valuable prizes will be awarded to the winner. The events are sanctioned by the F. A. M. and promise to draw well.

"SPOONING" UNDER DIFFICULTIES.

MANY cities throughout the country have placed a ban on tank riding, but the officials of Des Moines, Iowa, are among the first to rule against a regulation tandem seat. The Anthony Comstockish guardians of public morals in the Iowa city assert that riders and their girl passengers are in the habit of spooning as they spin through the streets, thereby placing in jeopardy the finer sensibilities as well as the necks of hapless pedestrians. All of which is calculated to provoke smiles from motorcyclists, for piloting a two passenger motorcycle through city traffic and spooning at the same time would entail a display of acrobatics beyond the capabilities of even the versatile owner of a single-tracker.

A NERVY MESSENGER

JUST as a Frisco train pulled out, Glenn Smith, a mail messenger at Lyons, Kansas, noticed a mail pouch he had forgotten to put on the train. Smith's motorcycle happened to be on the spot, so he threw the mail bag across the handle bars and started after the train, riding the ties. He knew the train stopped at Saxman, ten miles further on, but he arrived there a few seconds too late. Being familiar with the lay of the land, he knew that by riding down the country pike, he could overtake the limited as it passed the road. He set out at full speed and reached the track just as the train approached and threw the pouch to a railway messenger standing in the doorway.

AN UNEXPECTED DIVE.

GUSTAVE HENCKER, of 93 Targee street, Stapleton, N. Y., while riding on a dock at the foot of Water street in Stapleton recently, lost control of his machine, and both rider and machine went overboard. Hencker could not swim, but was saved by a bystander. The machine was lost.

PLANNING ROAD RACE

SEPTEMBER 1-2, the Bakersfield (Cal.) Motorcycle Club conducted a run to Fresno. A committee is now at work selecting a course for a road race of about 75 to 100 miles, which is to be held in the near future.

Part of the Big Crowd Lunching at Livermore (Cal.) Meet.

ON WANDAMERE BOWL.

SALT LAKE CITY, Utah.—The match race, which was to be the feature of the program on August 30, was somewhat of a disappointment to patrons of the Wandamere Motordrome. Ward's machine was still out of commission, and he was unable to compete at his best. He rode his own machine in the first heat, but used one of the track machines for the second heat. This gave Whittler both heats.

In the eight-mile race, the closing event of the evening, Ward rode another track machine and dropped out in the second mile. Whittler, Brodbeck and McNeil were riding in the order named. Brodbeck took good care not to let McNeil go around, and each time that he attempted to do so, Whittler would turn on a little more juice to help his team mate out, and they would both go up the track, leaving McNeil at the fence. The finish was one of the best seen on the track this season; they shot under the wire as they had ridden throughout the race.

The three-mile race for B Class professionals was a good one; Rognon won it after a hard fight with McCall. They were very evenly matched.

The five-mile open event was won by McNeil, who had an easy time defeating the other riders. In the first mile McNeil led most of the way; when Brodbeck went around, remaining in front for five laps. McNeil then came around and held the lead to the finish.

READING RACE MEET.

READING, Pa., August 31.—Under the auspices of the Reading Motorcycle Club six spectacular races were held on the fair grounds today. The weather was ideal and at least 2,000 people witnessed the contests. In the first event, a five-mile novice race, Pierce Hettinger, riding an Indian, won first prize.

Harry C. Becker, riding a Reading Standard, took first place in the five-mile race for private owners. His time was 6:50 $\frac{3}{4}$. In the third event five men entered the 10-mile race for trade riders, A. E. Braudreick (Indian), John Sparely (Merkel), Harley Williams (Indian), Joseph Grossman (Indian) and Paul Hart (Indian). Braudreick and Williams raced nip and tuck and in a strong finish, but Williams won the race. Time, 13:09 $\frac{1}{2}$.

AN ALTOONA RUN.

FLYING MERKEL riders in Altoona, Pa., were not unduly alarmed when they discovered on a recent outing that they numbered 23. Instead they took particular pains to demonstrate that hoodoos were out of their line, and the occasion was a pleasant one. The affair was engineered to perfection by W. S. Aaron, Merkel agent in Altoona. Six of the riders were accompanied by ladies. A stop was made at Loysburg for dinner and the squad then made a leisurely trip homeward.

TWO motorcycle police officers should be on duty at each precinct station in Minneapolis, Minn., says Chief Mealey, who is asking the city council there for an appropriation with which to purchase five additional machines.

IN order to cut down expenses the Bernardino (Cal.) Motorcycle Club has decided to dispense with its present clubrooms until next spring.

SHORT GRASS FINALE

Riders Found Fine Scenery and Some Hard Going on Last Few Days of the Big Western Tour.

THE Short Grass tourists left Denver on the morning of August 20, very early, bound for Colorado Springs. The scenery and roads were the best they encountered during the entire trip up to this time. They arrived in Colorado Springs in time for dinner, where they amused themselves for several hours; afterward they took a trip around Colorado Springs, taking in the Garden of the Gods and up through the Seven Mountain Passes, where they finally reached the top of Eagle's Pass. This is only a short distance from Pike's Peak. While up in the mountains, rain fell heavily, and the tourists were pretty well soaked by the time they got back to Colorado Springs.

On Wednesday, August 21, they left Colorado Springs at 8 o'clock for Canon City, a distance of 45 miles, over the most beautiful mountain roads of Colorado. These roads are kept up by the convicts stationed at the State Penitentiary in Canon City. The trip was made without trouble, except for the fact that a few riders had to pedal their machines up the steep hills.

Arriving in Canon City at 2 o'clock, the rest of the afternoon was spent in visiting points of scenic interest, including the beautiful apple orchards, and several historic landmarks. At the same time they visited the State penitentiary and were shown through from one end to the other. On Thursday, August 22, at 8 o'clock, the tourists took a trip to the Royal Gorge, which is regarded as the most beautiful spot in Colorado. Several pleasant hours were spent by the tourists in looking at the beautiful scenery, and just about the time they were to leave, one of the tail-enders arrived with a sack full of bottled beer; there was a scramble to see who could get to him first, and George Puls won first prize.

After leaving the Royal Gorge a trip to Sky Line Drive was made, where a beautiful bird's-eye view of Canon City could be had. After lunch, a race meet was held, in which

Wells Bennett took the honors. At 4 o'clock the tourists left for Pueblo, where they arrived covered with mud and soaked with rain.

The Goodyear tire car crew left four to five minutes after the bunch, and rode about twenty miles, where they found Dr. Patterson fixing up a rider's broken fork. They helped the doctor, and in a few minutes were on their way, but the rider with the broken fork reached a town five miles away and saw a train approaching Pueblo; he decided to ship his machine. Dr. Patterson kept on going. He always stayed ahead of the tire car by at least a mile up to the time the roads became very muddy from a severe rain storm.

Dr. Patterson, who was riding his daughter's machine that day, was too weak from his injury to push his machine through the mud where he could get on solid footing. When the tire car came along, the crew strapped his machine onto the side and carried both Patterson and the mount to Pueblo. As bad as the roads were from this point to Pueblo, a distance of thirty miles, accounts showed at night that all the tourists arrived safely.

The Deere Plow Company, of Moline, Ill., which manufactures the Velie automobile, placed one of their ten trucks in the Short Grass Tour in charge of Herb Schimp, of Kansas City, their branch manager. Mr. Schimp fixed the truck up to represent a prairie schooner, and was of great assistance to the tourists.

George Puls, the Harley-Davidson representative, is also to be awarded honorable mention, as he was the only rider in the tour who from start to finish worked for the interests of the tour and motorcycles in general, more than he did to get to his destination.

GEORGE REEVES, of Missoula, Mont., recently traveled from Seattle to Missoula on his motorcycle. The roads were good, with few exceptions.

SCHUSTER & SIEBOLD, well-known motorcycle dealers of Columbus, Ohio, have filed a petition in voluntary bankruptcy, alleging debts amounting to \$2,013.38, with assets of only \$1,054.98.

FOR R. F. D. SERVICE

IN the accompanying photograph, A. A. Farnsworth, of the sales department at the Flanders factory, is shown on the road with one of the Flanders machines which is ordi-

narily used for mail deliveries by one of the rural carriers. It will be noted that the arrangement of the mail pouches permits of a heavy load being carried without detracting from the general appearance of the outfit.

THE SHORT GRASS TOUR

1. Inez Patterson on her 4 H. P. two-Speed Indian.
2. Scenery en Route.
3. The bunch at Glacier Lake.
4. Geo. L. Schofield in his glory.

6. Party at top of Royal Gorge.
7. Mountain road between Colorado City and Canon City.
8. Coming into Canon City.

Hollenbeck, Klebes and Vanderbery in action on the Pt. Breeze Motordrome.

AT PHILADELPHIA.

PHILADELPHIA, Pa., August 22.—The races at Point Breeze Park tonight were the means of bringing out the largest crowd in the history of the motordrome. At the time of starting, the stands were packed and fifteen hundred people were trying to gain admission. Hartley Thomas, the western phenom, captured every event in which he was entered. In the unknown distance event he rode a spectacular race. The distance covered was nine miles, which he rode in 6:09½. This is the fastest time that has been made on this track. Hollenbach, on a Bradley, rode a match race with Klebes, Indian, and gave the latter the race of his life. In the Class B event, the racing was the best contested of the evening, the riders doing four miles in 2:50.

HOLLENBACH A WINNER.

PHILADELPHIA, Pa., August 27.—The feature of the races at the motordrome last night was the appearance of L. Fleckenstein, the Denver rider, who made his debut in a special match race with Hartley Thomas. Through some trouble with the express company, Fleckenstein did not have his own machine, and was compelled to borrow one for the occasion. He won the match race through the breaking down of his rival's machine. Hollenbach won every event in which he was entered.

FLECKENSTEIN IN FORM.

PHILADELPHIA, Pa., August 29.—This proved to be a big night at the Point Breeze Motordrome. The added attraction last night was a walking match. L. Fleckenstein, the Denver motorcycle star, was again the feature-maker of the evening, although Thomas pushed him hard. The special match race between Fleckenstein and Thomas had to be called off. Harry Klebes did not ride last night owing to illness.

TORONTO RIDERS BUSY.

THE speed merchants of Toronto, Canada, are facing a heavy program of motorcycling events to be staged on the exhibition half-mile dirt track during the next five weeks.

On the last day of the exhibition, September 7, a series of races will be run off for the

benefit of the thousands of fair visitors. On the following Saturday, the single-trackers will mix things with the racing motorcars at an auto race meet, while on September 28, the annual fall race carnival of the Toronto M. C. will be held. The titles of Ontario Provincial championships will be disposed of on this occasion also, the C. M. A. events being run off under the auspices of the Toronto club. The annual Ward Marathon is to be held on Saturday, October 5, and, as usual, the riders will be called upon to entertain the crowd.

TULLIS CLEANED THE BOARD.

KENTON, Ohio.—D. L. Tullis had a walk-away in the motorcycle meet at Mt. Victory August 17, winning all events in which he entered. In the ten-mile handicap event Tullis gave the other starters almost two full laps of the track. He won this event, also the five-mile handicap and the pursuit race. Summary:

Three-mile open race—Won by Houser, of Findlay; Waltur, of Findlay, second. Time, 4:45½.

Five-mile handicap—Won by D. L. Tullis; Houser, second. Time, 7:42½.

Time trial by Tullis; one mile exhibition; time, 1:20.

Ten-mile handicap—Won by Tullis; Houser, second. Time, 14:45.

Pursuit race, ten-mile limit—Won by Tullis; Lautenschlager, second; Swartz, third.

MISS L. WILLIAMS, of Los Angeles, who has won several medals for bicycling and motorcycling, is so enthusiastic about the latter sport that she wants to join the local police motorcycle squad.

MOTORCYCLES are being used for rush deliveries to neighboring towns by a large concern of Danvers, Mass.

AN ECONOMY WINNER.

JOE HOLLE, of Twentieth and Folsom streets, San Francisco, widely known as "The Bike Doctor," forwards the accompanying photograph of John B. Swanson, and the Harley-Davidson on which he made a remarkable showing in a recent economy contest at Alameda. The machine is a stock model, chain driven. Swanson carried a passenger, and covered five miles on 9¼ fluid ounces of gasoline. Swanson is first lieutenant of the San Francisco M. C.

"THE EARLY BIRD," ETC.

WHILE the outlook for unprecedented activity in motorcycle manufacturing during 1913 is a source of satisfaction to all who are interested in the trade, it is also forcing factory heads to realize that the coming season is due to be a trying one, and the wise builders are suggesting that dealers get on the firing line without delay. In other words, it seems to be generally taken for granted that the output of motorcycles for the 1913 season will fall thousands below the demand. Some manufacturers, not given to extravagant predictions, even go so far as to hint that the output will cover no more than half the orders.

The far-sighted dealer should find much food for thought in these statements. The sooner dealers close for territory and take up the matter of orders the sooner will the factory men be placed in a position to reduce the situation to figures and act accordingly. An early start on deliveries will work for more satisfaction among both dealers and riders than many weeks of overtime and double-shift production at the top of the season. No manufacturer hankers for these rush tactics; he prefers to strike his gait—the faster the better—early in the season and maintain it, but until the dealers are heard from he is considerably at sea. A record output is assured for 1913, but if you are looking forward to handling a share of it the time is at hand to open negotiations. Even a record output has its limitations.

THE RACING SITUATION.

MOTORCYCLE racing is rapidly developing—or, shall we say, degenerating?—into a business. The tendency is to supply a hungry public with what it wants—something spectacularly hippodromic. Be that as it may, real competition of the old-fashioned variety, with riders, dealers and manufacturers engaged in a strenuous endeavor to "beat the other fellow" is all but played out. The manufacturers are no longer active participants. Glance over the advertising pages of this issue and note how few race winnings are published. Racing, being a form of competition, has a value which is not to be ignored, but it seems to have had its day insofar as the manufacturers are concerned. Race meets are more numerous than ever before, but the makers of machines are no longer intruding to any extent. They have learned their lesson well.

SIDECARS.

EXTENSIVE use of a sidecar has convinced the writer that this side of the business and sport promises exceedingly well. The three-wheeler requires only a little improvement to make it a genuine competitor of certain automobile types. An attractive rig of the former variety is always certain to gain the favorable attention of the average bystander, and, what is more to the point, when used over at least tolerably good roads, it is great fun. We confidently believe that three to five times as many cars as there are now in use will be seen on the roads of the country by this time next year. Even now the demand is greater than the supply.

DESIGNS, PRICES, ETC.

NO radical changes in either designs or prices are expected in 1913 models. Except for the price-cutting jamboree of a year ago, history promises to repeat itself in the motorcycle trade. The production of machines and parts, however, will reach unprecedented and, until a few months ago, totally unexpected figures. Ask any parts-maker about 1913 specifications.

A GOOD SIGN.

RAILROAD officials advise that within a month there will be a freight car shortage of at least 150,000. This condition, while annoying to shippers and buyers alike, is not without its compensation. It points to a business boom of large proportions, and that on the eve of a Presidential election. The opinion is growing that no matter who lands the Presidency, trade will be fine and money easy in 1913.

ABOUT THE PAPER.

THIRTEEN thousand three hundred copies of this issue of *MOTORCYCLE ILLUSTRATED* are being printed, and the net paid circulation of this number is only 100 or so shy of 12,000. That's 50 per cent. higher than our paid circulation in September, 1911. A rather healthy growth, is our contention. The average business man is well satisfied with, say, a 20 per cent. annual increase.

JOE ESLER and Oscar Kathman, of Quincy, Ill., are waxing enthusiastic over the organization of a motorcycle club in Quincy and it is expected that the club will be established within the next few weeks.

THE NEW F. A. M.

DUE to circumstances beyond the control of the F. A. M., Pacific Coast members have been more or less neglected by the national organization. Their complaint to that effect is not without some justification. But under the new order of things, with government of, for and by the States, California and Washington will have every opportunity that is open to New York or Massachusetts. Those who doubt this statement are urged to write to Secretary Gibson for copies of the revised constitution and by-laws, which have just come off the press. Read the articles in both the constitution and the by-laws defining the duties and powers of State and local commissioners, and then get busy, determined to make your State the best organized in the Union. Under the new constitution the more the members of any State do for the F. A. M. in their State, the greater will be their returns in the way of benefits. Pacific Coast members, get a copy of the new constitution, and prove that to your own satisfaction.

THE RIGHT SPIRIT.

IN Dr. Patterson, the F. A. M. has a chief executive whose pluck is admirable, to say the least. Not one man in a hundred would have seen the Short Grass Tour through under the conditions of physical durability which confronted him when he started. Notwithstanding, and appreciative of the fact that his leadership was necessary to make the tour a success, Dr. Patterson started and, withal, he was there at the finish. This is enthusiasm of the highest and most commendable type, together with a determination to carry things through that promises well for the organization of which the Kansan is president.

ANOTHER BIG FEATURE.

THE adoption by the United States government of the motorcycle tri-car for the collection of mail should prove to be a big help to manufacturers in their efforts to promote the commercial use of the two and three-wheelers. Government approval of any product is generally recognized as sufficient evidence of its excellence and adaptability. In this particular instance, as always, the tests at Washington were severe and exhaustive, and that endorsement should follow such rigid try-outs demonstrates as much as the satisfaction of a dozen private firms.

RECORD THRONG ON LOS ANGELES RUN

More Than 1800 Riders Participate in Annual Outing at Venice—Jake De Rosier in Pacemaking Car

NO less than 1,800 motorcyclists participated in the annual club outing of the Los Angeles M. C. to Venice, on August 18, and it is stated that the turn-out was in many respects the most remarkable ever arranged by California riders. According to the official count of the club committee 1,058 motorcycles were in line, 791 carrying tandem passengers and 12 being fitted with side-cars. Figuring on this basis the club officials feel safe in saying that at least 1,873 riders took part in the program. A number of enthusiasts from neighboring towns were unable to join the big squad in the morning and were compelled to ride direct to Venice, which is known as the Beach City. As a result quite a few riders not included in the official count were on hand during the festivities.

Arrangements had been made with the various amusement concessionaires of Venice, by the club committee, by which reduced rates were granted to everyone wearing the official ribbon of the club. Full advantage was taken of this concession, and during the day the different places of amusement were thronged with khaki-clad riders, and girls in tassel caps and divided skirts. The uniform of the motorcycle rider was the "open sesame" in Venice, for one day at least.

Promptly on time in the morning the signal to move upon Venice was given by "Jake" de Rosier, former king of the motorcycle track, who left the Crocker Street Hos-

pital for the first time after three months of suffering from injuries received at the Stadium, to lead the run as honorary captain. Seated in a big touring car, Jake waved a signal to the waiting riders, and gave the word which started the run on its way to Venice. Down Grand avenue to Pico street sped the automobile, and then out Pico to Crenshaw and Washington boulevards. For more than a mile behind the machine came a procession of motorcycles, those carrying tandems leading the way, while behind followed the single riders and side-cars.

A uniform speed of twenty-five miles an hour was maintained by the pacemaking car, which was driven by "Gal" Blaylock, president of the club. Arriving at Venice, the automobile sped straight on into the beach town, but the motorcycle riders were sent by a roundabout route and first made their appearance on the broad walk fronting the beach.

Arriving at Los Angeles, after a fine return trip, the riders again assembled at the club house on West Jefferson street, where the annual run was wound up with an outdoor picnic banquet, served under the trees in the yard at the rear of the club house. In the absence of the riders the committee in charge of the banquet had been busy, and when the call for "supper" was given, long tables laden with a simple but thoroughly substantial picnic supper bade welcome to the tired and hungry riders.

HEADED EASTWARD AGAIN.

VOLNEY E. DAVIS, the trans-continental record holder, who is on his way across the country by motorcycle once more, reported at Reno, Nev., recently after a three-day trip from San Francisco. Little or no trouble had been experienced and Davis and his companion, Lou Golding, looked forward to making good time on the next leg of their trip. Davis is not making an effort to lower his present record, and the journey is being made primarily for pleasure. On the way to Reno the riders went over the Placerville grade to Lake Tahoe, from there to Carson City and then to Reno.

LICENSE REGULATIONS.

SAMUEL C. PARK, mayor of Salt Lake City, Utah, has instructed Attorney P. J. Daly to prepare a new ordinance, requiring motorcyclists to carry numbers three inches in height, running lengthwise, on a black background. The plate must be fastened to the rear mudguard.

AIR MAN TURNS RACER.

EDDIE HOLSINGER, of Canton, Ohio, formerly a professional balloonist, has forsaken the air game to become a professional motorcyclist. He was given a try-out at the Luna board track in Cleveland recently and made good.

TOURING ENGLAND.

DR. HARRY COPLEY and son Howard recently left Joliet, Ill., on a motorcycle trip of several thousand miles. They expect to ride to Montreal and Quebec, sail for Glasgow, and tour in England, France and Egypt.

NOTES FROM NEWARK.

THE motorcycle as an adjunct to sports is coming into evidence more and more in Newark and vicinity every day. Visitors to Weidenmayer's Park find the little two-wheeler hitting up the road alongside of its more stately brother and carrying its baseball fan owner to the park for the afternoon game; it is used for quick transit to the country club golf links, for an afternoon's outing in the country and various other purposes. William Garrabrants and Joseph Murphy, of Newark, are two ardent disciples of Izaak Walton, who find the motorcycle indispensable in pursuit of their favorite sport. Early in the spring, just as soon as the trout streams are open for fishing, these two hike away up into North Jersey or over the line into New York State, looking for the place where the trout are biting best.

WORK on the lighting plant at the Valisburg Motordrome is expected to be started in a few days. No definite date has been set for the opening of the night racing, nor have the nights been selected. Manager Derkum says, however, that he is desirous of avoiding conflicts with other night sports, and it is possible that Tuesday and Saturday nights will finally be decided upon.

THERE was a gala time at the last meeting of the Jersey M. C. The occasion was the club's annual midsummer night's entertainment. There was a big turnout of members.

RACES AT IOWA FAIR.

THREE motorcycle races were conducted recently by the management of the Sac County fair, at Odebolt, Iowa. They resulted as follows:

4 h., stock, 5 miles: Bates, Excelsior, first; Dorr, Indian, second; Fogel, Indian, third. Time, 7:13.

7 h., stock, 5 miles: Dorr, Indian, first; Bates, Excelsior, second; Keir, Excelsior, third. Time, 6:35.

7 h., free-for-all, 10 miles: Dorr, Indian, first; Bates, Excelsior, second. Time, 13:6.

GOVE WINS AT BROCKTON

EARL G. GOVE, of Brockton, Mass., carried away the honors at the recent motorcycle races held in that city. He finished the 10-mile amateur race in 13:10. B. H. Swanson was second and Leon W. Luden, third. In the 15-mile trade riders' race the same order was maintained, Gove's time being 19 minutes.

TRINIDAD MOTORCYCLE CLUB.

THE Trinidad (Col.) Motorcycle Club has been organized with a membership of twenty. The following officers were elected: E. M. Broadwell, president; Sam Morse, vice-president; T. F. Kane, treasurer; Henry Abott, secretary. Charles Stevenson was chosen field captain and his two lieutenants are John Swinton and Charles Makloski.

AFTER ECONOMY RECORD.

GEORGE EDER and George Snyder, of Reading, Pa., are en route on a 1,500-mile motorcycle journey to St. Louis and return. They expect to complete the trip on 25 gallons of gasoline—an average of 60 miles per gallon of gas.

FRANK BOYD, president of the Maryland Motorcycle Club, is en route on an extended motorcycle trip through England.

PATENTED VALVE SPRING REMOVER.

1,034,874. Valve Spring Removing Device. Patented August 6, 1912, by G. F. Clark, Daytona Beach, Fla. This consists of a forked rod and separate U-piece on which is fitted another U-shaped piece near the forked end.

A curved piece and chain attached complete the apparatus. For removing the valve spring, the separate piece pivoted within the forks of the rod is fitted to engage the lower end of the valve spring, and the curved upper piece is placed against the head of the valve and connected by the chain to the U-shaped piece as illustrated. On pushing down on the end of the rod the spring is lifted and the cotter or fastening device removed.

AUGUST GAINS IN F. A. M.

F. A. M. membership gains for August were as follows: Maine, unaffiliated, 3. New Hampshire, unaffiliated, 5; renewals, 1. Vermont, unaffiliated, 1. Massachusetts, affiliated, 15; unaffiliated, 6; renewals, 6. Rhode Island, affiliated, 1; unaffiliated, 6; renewals, 5. Connecticut, unaffiliated, 2; renewals, 4. New York, affiliated, 39; unaffiliated, 37; renewals, 28. New Jersey, affiliated, 9; unaffiliated, 8; renewals, 7. Pennsylvania, affiliated, 23; unaffiliated, 24; renewals, 16. Maryland, unaffiliated, 1; renewals, 1. Virginia, unaffiliated, 2; renewals, 3. West Virginia, affiliated, 6; renewals, 1. Delaware, unaffiliated, 1. District of Columbia, renewals, 1. Tennessee, renewals, 1. Georgia, affiliated, 1; unaffiliated, 1; renewals, 2. Florida, affiliated, 19; unaffiliated, 1; renewals, 3. Arkansas, renewals, 1. Texas, affiliated, 22; unaffiliated, 4; renewals, 5. Kentucky, unaffiliated, 3; renewals, 1. Oklahoma, unaffiliated, 1. Ohio, affiliated, 68; unaffiliated, 25; renewals, 42. Indiana, affiliated, 10; unaffiliated, 10; renewals, 10. Illinois, affiliated, 27; unaffiliated, 19; renewals, 17. Missouri, affiliated, 6; unaffiliated, 2; renewals, 2. Wisconsin, affiliated, 19; unaffiliated, 11; renewals, 5. Michigan, affiliated, 29; unaffiliated, 23; renewals, 6. Minnesota, affiliated, 49; unaffiliated, 1; renewals, 2. South Dakota, affiliated 1; unaffiliated, 1; renewals, 8. Nebraska, affiliated, 1; unaffiliated, 1; renewals, 3. Kansas, affiliated, 15; unaffiliated, 2; renewals, 2. Iowa, affiliated, 3; unaffiliated, 2; renewals, 1. California, affiliated, 41; unaffiliated, 4; renewals, 3. Utah, unaffiliated, 1; renewals, 1. Colorado, affiliated, 23; unaffiliated, 2; renewals, 27. New Mexico, affiliated, 14; unaffiliated, 2. Arizona, affiliated, 11; renewals, 2. Montana, unaffiliated, 1; renewals, 1. Oregon, affiliated, 4; unaffiliated, 1. Washington, affiliated, 44; unaffiliated, 1; renewals, 6. Canada, renewals, 1. Total, affiliated, 528; unaffiliated, 208; renewals, 225.

NEW F. A. M. CLUBS.

SECRETARY G. B. GIBSON reported new affiliated clubs, August 16-31, as follows: Ravenna M. C., Ravenna, Ohio; W. N. Beach, secretary, 165 Diamond street, 15 members, 100 per cent.; York M. C., York, Pa.; H. S. Bortner, secretary, 411 W. Market street, 15 members, 100 per cent.; Middletown M. C., Middletown, N. Y.; W. M. Mapes, secretary, 27 Mulberry street, 25 members, 100 per cent.; Sunshine State M. C., Albuquerque, N. Mex.; H. A. Douglass, secretary, Box 210.

THE REPAIR SHOP LIST.

REPAIR shops were added to Secretary Gibson's list between August 16 and 31 as follows: E. Runyan, Elwood, Ind.; Martin F. Murray, School street, Glen Cove, L. I., N. Y.; Stebbins & Geynet, Sachem Park, Norwich, Conn.; C. M. Snyder, 136 W. Pearl street, Jackson, Mich.; George Reisinger, 12

W. Tenth street, Anderson, Ind.; Buettner-Heinz Company, 504 State street, E. St. Louis, Mo.; Davoll & Wilmeth, 1531 "O" street, Lincoln, Neb.; Harry T. Johnson, 402 W. Central avenue, Albuquerque, N. Mex.; J. A. Nadcau, 219 West Gold avenue, Albuquerque, N. Mex.

JAPANESE RIDERS BUSY.

IN June Chairman Estabrook, of the F. A. M. membership committee, received a request from Tokio, Japan, for information which would assist the motorcyclists of the Mikado's city in the organization of a body along the general lines of the F. A. M., and all the available literature was promptly forwarded. A few days ago he received a letter from his former correspondent stating that the F. A. M. circulars and booklets afforded all the information necessary and that a national association of Japanese motorcyclists will no doubt result from the movement in which he has assisted. Brothers of the motorcycle fraternity who wish to drop a line of encouragement to the Tokio enthusiast may address him as follows: K. Utsunomiya, 7 Minamikinrokucho, Kyobashi-ku, Tokio. Simple enough, once the address is fixed in your mind.

F. A. M. SAYS "THANKS."

NATIONAL SECRETARY GIBSON has forwarded letters to the city officials of Columbus and the Columbus Motorcycle Club, thanking them in behalf of the F. A. M. for the cordial reception tendered the motorcyclists who attended the Federation convention in the Ohio capital.

A CLEVELAND VICTOR.

THE accompanying photograph shows Don Klark, the Detroit speedster, as he appeared after winning a spectacular race at the big meet of the Cleveland Motorcycle Club at Randall track on August 25. Kissig and several others made excellent showings, but Klark had something of a corner on the honors of the day. The photo is by Arthur M. Schnetzler, a Cleveland motorcycle enthusiasts.

SUGGESTS TRIPLE ALLIANCE.

SUGGESTING the drawing up of a working agreement between the two bodies, President K. R. Spencer, of the Canadian Motorcyclists' Association, has written an official communication to T. W. Loughborough, of London, England, secretary of the Auto-Cycle Union. Mr. Spencer has also approached the F. A. M. directorate on the same question and hopes for the establishment of a "triple alliance" between the three countries.

A BALTIMORE HUSTLER.

BALTIMORE, Md.—William Wood, the Maryland F. A. M. Commissioner, has been assured of reappointment by President Patterson and this reward of his arduous work in the past has stimulated Mr. Wood to get still busier and endeavor to treble the membership from Maryland in the national organization.

VICE-PRESIDENTS NOTIFIED.

NATIONAL SECRETARY GIBSON, of the F. A. M., has communicated with the retiring vice-presidents of the old Federation districts, formally notifying them of the change in government of the body and thanking them for their efforts in behalf of the organization during the last fiscal year.

IN NEW OFFICE.

SECRETARY G. B. GIBSON reports having moved into his new offices, where he is much better fitted to handle F. A. M. business, owing to additional room and greatly improved lighting facilities.

READY FOR PARADE.

MEMBERS and friends of the Englewood Motorcycle Club, of Chicago, will participate in a lantern parade on September 7, starting from the club's headquarters at 8 p. m. The decorated machines will travel north on Michigan avenue to Thirty-third street, east to the various boulevards and finally to the beach just south of the German building, where a marshmallow roast will be held. Other light refreshments will be served, and there will also be a program of games.

MOTORCYCLISTS ARE BARRED.

MOTORCYCLISTS in Atlanta, Ga., are waging a spirited campaign with a view to having the Piedmont Park track thrown open to them. The Park Board has placed a ban on automobiles, motorcycles and bicycles as far as the track is concerned, and when the Atlanta boys wanted to hold a race meet recently they were forced to stage their races at Rome, Ga. A formal appeal has been made to the city officials.

MOTORCYCLE races are now being held in Cape Town, South Africa, and reports say the meets are well attended.

AMONG THE CLUBS

CANADIANS ARE BUSY

C. M. A. Territory is Divided into Five Districts and Regulations Are Being Framed.

TORONTO, Can.—The Canadian Motorcyclists' Association is gradually taking definite shape, recent meetings of the officers having resulted in the working out of a number of important details. The jurisdiction of the organization has been divided into five districts, as follows: British Columbia, Manitoba, North Western Provinces, Ontario, Quebec and the Maritime Provinces. Organization work is being carried on in each of these districts with apparent results.

It has been decided to hold the annual meetings in midwinter instead of during the "open" season, to insure a better attendance of delegates and more interest. It is intended to hold the annual assembly between November 1 and January 1 of each year and the next convention is to be held at Toronto. Private promoters will be charged a sanction fee of \$25 for race meets while that for clubs will be \$10. Any society or lodge putting on one or two races at a picnic or celebration is to be classed as a club.

Affiliated clubs will be allowed representation at general meetings as follows: Clubs with from 10 to 50 members, one delegate; from 50 to 100 members, two delegates; for each additional 100 members, or fraction thereof, one extra delegate. Notices for general meetings will have to be sent out not less than 15 nor more than 30 days prior to the date of the gathering. A press bureau is to be established and a system for keeping the directors informed of all business has been adopted.

W. J. Tite, of London, Ontario, Chairman of the Legal Action Committee, has been instructed to take up the matter of a working agreement between the F. A. M. and the C. M. A., and to communicate with the Auto-Cycle Union of Great Britain with regard to the establishment of mutual relations.

The Hamilton Motorcycle Club has donated to the association a handsome trophy to be emblematic of the National championship of the association. Nelson Chambers has been appointed chairman of Memberships for the coming term.

EIGHT ROUTES COVERED.

EIGHT out of nine rural mail routes, extending from the Princeton (Ill.) post office, are being covered by motorcycle, the ninth by auto. Country dwellers receive their mail as soon as the city folks and it is claimed that all the carriers are back by 11 a. m. None of the routes is less than twenty miles long.

BALTIMORE TOURISTS.

PRESIDENT FRANK BOYD, of the Maryland Motorcycle Club, of Baltimore, is back home after a long tour through the New England States, New York and New Jersey. Roger Wilkens and Ed. Rasmers are also back from their trips, and both are well pleased with their machines. Their trip covered nearly 1,000 miles.

READING CLUB MEDALS.

MEDALS were awarded to the following twelve members of the Reading (Pa.) Motorcycle Club, who finished with perfect scores in the annual endurance run: Daniel Hart, James Mayo, William Buel, Samuel Killian, P. Maurer, Jacob Deysher, William Staudt, Samuel Nye, William Henry, James Dunkle, Ezra Hartman and Benjamin Pike.

The club presented John H. Hull, of Mt. Hope, who entertained members of the club on two occasions, with a gold watch fob. The charm is an F. A. M. emblem.

TORONTO VAN OUTFIT.

THE van outfit shown in the photograph is in use by a wholesale house in Toronto, Can. The firm uses several motor trucks, but finds that for comparative efficiency and economy the motorcycle has

a long lead. The outfit is used principally for rush orders that have to be carried into the suburbs. Stephen Wilkins, 151 Winchester street, Toronto, forwards the picture.

IN order to cut down expenses the Bernardino (Cal.) Motorcycle Club has decided to dispense with its present clubrooms until next spring.

A MOTORCYCLE CARNIVAL

Hundreds of Riders Will Masquerade as Indians During Big Annual Fair in San Jose.

HUNDREDS of motorcyclists of San Jose, Cal., and vicinity have completed arrangements to participate in the annual county fair celebration to be held in San Jose, and on September 9 they are to invade the city on their machines, costumed as Indians. There will be more warriors, squaws and squawlets riding through the city streets than the old place has seen in many a day, and the motorcycle carnival promises to be one of the most spectacular features of a remarkable program. The county fair management has offered valuable prizes for the motorcyclists who present the best makeups. One will go to the most chief-like Indian and another to the most squaw-like squaw. Other prizes will be awarded for attractively decorated machines.

Motorcycle racing events will be pulled off during the presence of the costumed visitors and another feature during their presence will be a big parade through the town, in which it is expected that 2,000 riders of motorcycles will participate.

All the motorcycle and automobile racing events, it has been decided, will be run between Saturday, September 7, and Monday evening, September 9. On the latter day the Indians will be one of the chief attractions. Two open-to-all motorcycle events in heats will give the motorists ample opportunity to win prize money and trophies.

LORAIN'S FOUR-RUN SERIES.

SO far several riders have perfect scores in the four-run series which is being conducted by the Lorain (Ohio) M. C., and there are indications that the final trial, scheduled for the first Sunday in December, will find a squad of the riders contesting desperately for first place. The trophy is a handsome loving cup which was donated to the club by Doctor Webster, who, until a few days before his death several months ago, was the most active worker for the advancement of the organization. The first run was held on the first Sunday in March, the second on the first Sunday in June and the third on September 1. The club aims to carry out the plans exactly as they were outlined by Doctor Webster.

NO TIME LOST.

TWO cities are already after the 1913 meet of the F. A. M. Columbus, the host of the last meeting, is anxious to fill the role another time, while Toledo, O., through the chamber of commerce, has put in a "bid" for the next convention.

UTICA RIDERS ON FLOAT

Novel Motorcycle Display Was a Feature of Big Sherman Notification Parade.

MEMBERS of the Utica Motorcycle Club figured prominently in the carnival parade incident to the Sherman Notification Day celebration which was held in Utica, August 20 and 21. As Utica is the home city of the Vice-President the townspeople felt called upon to let out a notch in their enthusiasm, and the program was a most effective one.

The motorcycle display took the form of a float which was built on a huge automobile truck. It was decorated with bunting in the national colors, flags and club pennants, and on either side was a large sign bearing this inscription: "The Utica Motorcycle Club is a Utica Booster too. Safe, Sane and Quiet-Riding." The float was occupied by members of the Utica M. C. with their wives, daughters and sweethearts and the presence of the ladies did much to give an air of dignity and conservatism to the club's display. The phrase "Safe, sane and quiet-riding" also attracted attention, for the Utica riders have been well to the fore of late in the campaign to discourage indiscriminate use of muffler cut-outs.

The float idea for a motorcycle club is a new one, and the Utica squad and clubs in neighboring cities intend to make use of it whenever an opportunity presents from now on. It obviates the troubles met with in motorcycle carnival parades, where the procession usually moves so slowly that riders are forced to race their engines free and make frequent stops.

HERE IS "SOME GOING."

RALPH HOBBS, of Hobart, New Mexico, says his motorcycle has outclassed the greyhound for hunting jackrabbits. Hobbs' first experience in that line was when he was riding along the road and a jackrabbit ran ahead of him. Hobbs let his machine out but the rabbit loped along at a moderate gait, easily keeping out of the way.

Finally Hobbs opened his throttle and ran up close to the jack. Then the rabbit got down to fast work, just making a streak along the dusty road. There was no fence at either side, but the jackrabbit was running so fast that it could not turn aside. Hobbs continued to gain, and in three hundred yards ran over the animal, crushing it to death. Since then Hobbs has raced a number of jackrabbits, overtaking each one. He admits, however, that they can put his machine up to its best work.

ELEVEN motorcyclists of Northampton, Mass., recently visited Worcester and Shrewsbury, Mass., on a Sunday run.

MEMBERS of the Dayton Motorcycle Club recently made a run to Cincinnati, Ohio, to attend a picnic given by the Queen City Motorcycle Club.

EDWIN PAXTON, of 25 West Fayette Street, Baltimore, Md., rode from Port Penn, Del., over sandy stretches to Baltimore in seven hours, on his Indian 7.

H. P. Yonkers.

IOWA CHAMP HURT.

IOWA'S champion motorcyclist, H. P. Yonkers, of Cedar Rapids, was injured recently while racing with a rider named Bates at the Boone track. He is now doing nicely, but will not be able to enter any more events this season. Yonkers was a full fifty yards ahead when he skidded at a turn and fell; Bates was unable to avoid hitting him. He was carried to the Boone hospital in an auto, where he was confined for two weeks. Yonkers has won seventeen events straight this season on his "Green Tank" Indian, a special 4 h. He is well liked and is the best known rider in the state.

CHICAGO TO OMAHA.

DAVID M. Kalbfell, 1120 Wolfram Street, Chicago, Ill., and his sister, Miss Lulu Kalbfell, expect to complete a 1,500-mile motorcycle trip from the Windy City of Omaha, Neb., some time this week. Stops were made at Rockford, Ill., DuBuque, Ia., Waterloo, Neb., Mason City, Neb., and Minneapolis, Minn. They are riding tandem.

ILLINOIS RIDERS ON MISSOURI TRIP

Four Quincy Enthusiasts, Mapping Run for Prospective Club, Learn That Path-finding Often Has Its Drawbacks

By JOSEPH ESLER

AS the boys were going to form a local motorcycle club, with the intention of affiliating with the F. A. M. after the club was on solid footing, four of us decided to do a little scouting and lay out a trip or two for the club to take later in the season. The party consisted of: Oscar Kathman, a local dealer; Don Castro, the smallest and one of the nerviest riders in town (by the way Don says he is only fourteen); Will Kidson and the writer.

Castro's Machine Disabled.

We trailed out on the road in Indian file and about six miles out, the writer found Castro at the side of the road, with the front fork of his machine very badly twisted. An automobile filled with people stood a few feet away, and Castro explained that he either skidded into the auto or the car bumped into him; he wasn't sure which. All that could be done was to hire a farmer's wagon to take the damaged machine back to the city.

However, Don wasn't going to be deprived of the trip by a little thing like a damaged machine, so Kathman took him astride his tank and we reached Hannibal in this fashion. The going was certainly rough, sand, stones and ruts all combining to make it a hard trip. The road was so bad that I shook the generator off my lamp and to make a good job of it ran over it before I could stop the machine.

Too Late to Hear Bryan.

No sooner had we reached Hannibal than Kidson's front tire lost its air and we found a very sharp thorn had penetrated his casing. A repair was finally made and, accompanied by some of the Hannibal motorcycle boys, we decided to run over to Palmyra, about fifteen miles to the west, and hear William Jennings Bryan make a speech.

We had to do a little hill climbing, but this was play for our machines. We arrived in Palmyra all right, but too late to hear the "Peerless One."

Puncture and Chain Trouble.

It was about eighteen miles to Quincy. A few miles out we met a rider by the name of Henry Fields, who was having chain trouble. We fixed him up and he joined the procession.

We were sailing up and down the hills, but had to slow up often, as it seemed every horse we met was fractious, and we were careful not to cause any runaways. We had to ford a small creek and the next accident befell Kathman, who got a puncture. Then Fields had more chain trouble. In the meanwhile the writer was having his own troubles, as I went on my way with no light, and darkness was rapidly coming on. All was well until I hit a little hamlet called Taylor, noted for the beginning of a very rough bottom road.

At last the lights of Quincy gleamed in the distance and when I rode onto the bridge that spans the Mississippi there I was rewarded with a beautiful view of the "Gem City." The majestic moon casting its silvery beams over the mighty river was a fine picture indeed.

Back Home at Last.

I reached home about 8 o'clock, pretty well shaken up and tired out. The rest of the bunch came trailing in, until Kidson showed up at 9.30, tired out but happy to be home again.

On the next trip the boys are going up the river about forty miles to Keokuk, Iowa, to catch a glimpse of the huge dam and power houses, costing over \$25,000,000, which will harness the power of the "Father of the Waters" and by transmission lines send it to St. Louis, Mo., one hundred and seventy-five miles away.

Holiday Race Meets

BOYD CORNERS THE HONORS.

DENVER, Col., September 2.—A fine program of races was pulled off at Tuilleries Park on Labor Day, consisting of a long-distance event and two short match races. Boyd was the star of the day, taking down two firsts, while Cox came in for the third victory. Boyd led in the twenty-five mile event for the entire distance. He jumped out and took a good lead in the first ten miles. Cox, who was in a badly crippled condition from his spill of the day before, put up a game race all the way through and finished second.

Richards was hanging right with the bunch until the sixth mile, when his rear tire blew up and eliminated him from the contest. Bowen had trouble with his engine all the way through and was forced to leave the track once more to make repairs. He again entered the race and had succeeded in covering 20 miles when Boyd finished. The 5-mile match race between Cox and Boyd kept the crowd on their feet all the time, first one and then the other having the best of it. In the final lap, however, Boyd gained a slight advantage, which he carried with him to the tape. The 3-mile match race between Cox and Richards was one-sided in favor of Cox, who jumped out from the start and stretched his lead into almost a lap at the finish. Summaries:

25-mile open professional, 61 class—"Slivers" Boyd (Indian); Jim Cox (Merkel); L. E. Bowen (Merkel). Time, 18:01½.

Five-mile match race, professional, 61 class—"Slivers" Boyd (Indian); Jim Cox (Merkel). Time, 3:40½.

Three-mile match race, professional, 61 class—Jim Cox (Merkel); Richards (Indian). Time, 2:11½.

SPRINGFIELD (O.) RACES.

SPRINGFIELD, Ohio.—Eight good events were witnessed in the motorcycle meet at the Labor Day celebration on the Fair Grounds today. Several thousand people were in attendance and the program met all expectations. Summaries:

Two-mile race, 30.50 machines—Remmeter (Flying Merkel), first; Hicks (Indian), second; Wilkins (Thor), third. Time, 2:47½.

Four-mile race, 30.50 machines—Remmeter (Flying Merkel), first; Wilkins (Thor), second; Brown (Flying Merkel), third. Time, 5:42½.

Pursuit race, ten and half miles—Remmeter (Flying Merkel), first; Hicks (Indian), second; Strong (Emblem), third. Time, 15 minutes.

Three-mile race, 30.50 machines—Hicks (Indian), first; Remmeter (Flying Merkel), second; Gast (Excelsior), third. Time, 4:28½.

Four-mile race, belt drive—Strong (Emblem), first; Gast (Excelsior), second; Remmeter (Flying Merkel), third. Time, 5:57½.

One-mile novelty—Hicks (Indian), first; Wilkins (Thor), second; Remmeter (Flying Merkel), third. Time, 2:26½.

Five-mile race, 5 h. machines—Hicks (Indian), first; Remmeter (Flying Merkel), second; Wilkins (Thor), third. Time, 7:01½.

Ten-mile race, 5 h. machines—Remmeter (Flying Merkel), first; Hicks (Indian), second; Lubbers (Indian), third. Time, 13:34½.

FORT WAYNE MEET.

FORT WAYNE (Ind.) motorcyclists witnessed a high-class race meet on Sunday, September 1, when such well-known speedsters as Don Klark, "Shorty" Matthews, Evans and Long figured in the events. Evans spilled in the third race, but was able to compete in later events. A 50-mile grind was the feature of the card. In this race Klark broke the track record by turning off his twenty-first mile in 48½. Walter Kiel, a local amateur, finished in second place. Matthews was forced out of the 50-mile event by magnet trouble.

COX IN BAD SPILL.

DENVER, Col., September 1.—An excellent program of races was presented at the Tuilleries Motordrome Sunday afternoon. The races were all hotly contested and the finishes extremely close. "Slivers" Boyd got away with the honors of the day by winning two races, while "Curly" Fredericks and Eddie Swartz each got one. The Australian pursuit race was an easy victory for Fredericks, who overtook Cox in the third lap of the second mile. In the invitation race "Slivers" Boyd jumped out in the lead with Cox close behind. After a few laps had been covered Fredericks pulled up alongside of Cox and had just got half his machine past when he cut down the track, throwing Cox's front wheel from under him. Cox quit his machine, sliding on his back and shoulders to the running board and then rolling over and over some 100 feet from the point where he fell. Cox's bruises were many but not serious, his body being filled with hundreds of small slivers. Clever riding on the part of Boyd brought him across the tape a few inches to the good over Fredericks.

The match race between Fredericks and Swartz was of the whirlwind variety, with neither having the advantage until the last lap, when Swartz slipped past and won by a slight margin. After the race was over Fredericks resented the remarks of the referee about his rough riding tactics and was given a 10 days' suspension. The program closed with a match between "Slivers" Boyd and L. E. Bowen, which was very interesting. Boyd gained a slight lead in the last lap, which he maintained to the finish. Summaries:

Australian pursuit race, professional, 61 class—Fredericks won over Cox after covering two miles and two laps. Time, 2:02½.

Five-mile match race, professional, 61 class—Ed Swartz (Excelsior); Curly Fredericks (Excelsior). Time, 3:31½.

Five-mile invitation, professional, 61 class—Slivers Boyd (Indian); Curly Fredericks (Excelsior); L. E. Bowen (Merkel). Time, 3:32½.

Three-mile match race, professional, 61 class—Slivers Boyd (Indian); L. E. Bowen (Merkel). Time, 2:19½.

MARION'S HOLIDAY MEET.

FOLLOWING are the summaries of the races held by the Marion (Ind.) M. C. on Labor Day:

Ten miles, open—Heckman, first; Creviston, second; Hardwood, third. Time, 14:20½.

Five miles, open—Creviston, first; Shaffer, second; Heckman, third. Time, 6:39½. Sudduth fell on the backstretch in the second lap, machine and rider turning two somersaults. Close race throughout between Shaffer and Heckman.

Five miles, stock—Heckman, first; Hagan, second; Shaffer, third. Time, 7:01.

Ten miles, for Grant County championship—Hardwood, first; Miles, second; Scott, third. Time, 14:24. Half-hour race—Creviston, first; Shaffer, second; Heckman, third. Distance, 22½ miles for Creviston. Attendance, 2,500.

HUTTINGER'S MACHINE ABLAZE.

CLEVELAND, Ohio, August 25.—In the miss-and-out event at the Luna bowl today Finn Huttinger's machine was destroyed by fire. Huttinger himself escaping injury. The feature race was won by Charlie Glenn, of Toledo. Brownie Carslake took first money in the nine-mile professional and Gibson won the ten-mile event. Henikman won over Huntsberry in the amateur event.

NORMAN BENT, of Green Bay, Wis., recently won first place in five out of six events on the Oconto track.

AMATEUR RIDER HURT.

NEWARK, Ohio, September 2.—Harry Horschler, an amateur rider, sustained a broken leg in the third event of to-day's races. This event was unfinished. The summaries:

Ten-mile club championship—Harry Horschler (Indian), first; Walter Kushmaul (Indian), second. Time, 14:10½.

Five-mile, stripped stock—Harry Horschler (Indian), first; Walter Kushmaul (Indian), second.

Ten-mile, stripped stock machines—Walter Kushmaul (Indian), first; McGough (Harley-Davidson), second. Time, 14:25.

Five-mile, belt driven machines—Charles McGough (Harley-Davidson), first; Francis (Harley-Davidson), second. Time, 7:42½.

Three-mile novelty race—Kushmaul (Indian), first; Francis (Harley-Davidson), second. Time, 5:27½.

One-mile trial—Kushmaul (Indian), first. Time, 1:2. McGough (Harley-Davidson), second. Time, 1:28½.

FREDERICKS SWEEPS BOWL.

DENVER, Col., August 26.—"Curly" Fredericks, the local rider, jumped into prominence today by winning every event in which he competed. The only race in which Fredericks was not entered was won by Boyd. He nosed out Cox in a fast finish. In the first event the starter discovered a small piece of board on the track and flagged the riders. They argued that they were in no danger and the prize money was divided according to the positions the contestants occupied when they were flagged. The match race between Cox and Fredericks was "pie" for the latter.

The last race, while not at all close, was extremely interesting to the spectators. Swartz had lost considerable ground in the first two miles on account of engine trouble, but had got righted again and was gradually closing up on Cox who was in second place. Fredericks had jumped out from the start and was increasing his lead with every lap. The questions in the minds of all were: Would Fredericks lap the bunch and would Swartz take second place from Cox? Just as the tape was reached the three riders were in a bunch.

KLARK WINS A GRIND.

CLEVELAND, Ohio, August 25.—At the North Randall track fully 2,500 people were present today to see the races. Don Klark set a new 100-mile dirt track record, making one stop for gasoline and oil. Baker, of Indianapolis, made the distance without a stop, and came in second. Kissig was third. In the five-mile novice event Lawrence came in first, with Quackenbush a close second. Tracy defeated Kissig in the 30:50 Club Championship event, but Kissig was the victor in the 61:00 class.

A protest was registered by William Lister against the winning Indians and after the machines were taken to the establishment of L. J. Mueller, Referee McConnell and other officials took down the motors. It is stated that several of the machines were found to have drilled pistons and Referee McConnell will obtain a final ruling from Chairman Thornley before deciding whether these conditions constitute a breach of the regulations.

ANOTHER TRACK RECORD.

PEORIA, Ill.—Only time trials took place here Labor Day. Mike Cafferello, of Chicago, on a seven Indian, broke the track record, making the distance in 52 1-5 seconds, bettering the record made by Joe DeSalvo, also, of Chicago, by five and four-fifths seconds.

Band on parade through the park before the Riverview races.

RACES AND BARBECUE

**Members and Friends of the Chicago M. C.
Enjoy a High-Class Program at
the Riverview Motordrome.**

THERE was a big turnout of riders at the race meet and barbecue of the Chicago Motorcycle Club at the Riverview Motordrome on Sunday, August 25. Members and friends of the club formed a procession at the headquarters and rode to the motordrome, headed by the officers who carried a large club banner. After the barbecue, which had been in course of preparation since the night before, the riders witnessed a fine racing program.

John Constant, the speedy Brooklynite, carried off the honors for the day, including the Riverview Cup, in the 6-mile event. Court Edwards attracted much attention with a unicycle on which he rode an exhibition mile in 5:25½. The card closed with a half-hour race, which was won by Constant. Summaries:

Six miles, cup race, stock 61.00—Constant (Indian); Mason (Indian); Hamilton (Indian). Time, 5:25½.
Two miles, stock, 30:50—Wenk (Thor); Bethke (Thor); Mitchell (M. M.). Time, 2:00½.
Exhibition mile—Edwards (unicycle), 5:25½.
Three miles, open, 61.00—Constant (Indian); O'Loughlin (Indian); Mitchell (Eagle). Time, 2:09½.
Stock 61.00, first heat, two miles—Mason (Indian); Shaw (Indian); Bethke (Thor). Time, 1:46½.
Second heat, two miles—Hamilton (Indian); Wenk (Thor); Rider (Indian). Time, 1:53½.

Pres. Hill presenting cup to Constant.

Final heat, two miles—Mason (Indian); Hamilton (Indian); Shaw (Indian). Time, 1:43.
Mile time trials, professional—Humiston (Excelsior), :40½; Wolters (Excelsior), :40½; Balke (Indian), :41.
Half-hour race, stock 61.00—Constant (Indian); Mason (Indian). Distance, 34 miles, 2½ laps.

HASHA STILL WINNING AT BRIGHTON

BRIGHTON BEACH, August 29.—Eddie Hasha added another race to his long string, tonight, winning the Bradhurst 6-mile handicap race at the Brighton Motordrome. Hasha allowed his competitors liberal handicaps, each man having a lap and 200 yards. He caught the field on the fifth mile and loafed along to within 100 yards of the finish. He then opened up for a final sprint and won, with yards to spare. Ferdie Mercier, of Brooklyn, finished second, and Herbert Ayrault, of Newark, third.

The 5-mile race went to George Lockner, of Syracuse, after three exciting heats. The riders were bunched most of the distance in each heat. Billy Shields, also of Syracuse, carried off second honors, and William Wray, of Brooklyn, was in third place. Herbert Ayrault made his debut as a professional rider in the second heat of the 5-mile professional race. He put up a very creditable perform-

ance, winning second place in his initial heat and finishing third in the next heat.

Ferdie Mercier, the Brooklyn flyer, has earned the distinction of being a consistent winner. He won each heat of the three-cornered match race, defeating George Hamilton, who was second, and Earle Eckel, who finished third.

The match race of the evening was between J. B. French and Ira M. Vail, who made his debut as an amateur. Vail was not expected to show good form, as he was inexperienced and had just received his machine from the factory. He, however, upset the calculations by winning the second and final heats in easy fashion.

BRIGHTON BEACH, August 24.—Harry Hamilton, of Newark, N. J., broke into the limelight at the Brighton Motordrome by winning the feature events of Saturday night's

program. In a special 13-mile match race with Billy Wray he won the first heat by half a length. In the second heat he was forced to retire with a broken exhaust valve and Wray finished alone. In the final heat Hamilton won by a wheel's length.

The speediest talent of the track was arrayed against Arthur Chapple in the 9-mile "Highlander" handicap. Hamilton, Wray, Mercier, Lockner and Cox each had two laps. Mercier and Cox retired in the first mile with carburetor trouble. Chapple gained the lead on the first lap and set out to cut down the handicap. Chapple caught the field on the sixth mile, gaining one lap. He tried desperately to get the second lap, but failed by a third of a lap. Hamilton, Lockner and Wray rode bunched the entire distance and finished in that order.

Johnnie Albright, the Denver flyer, threw the oil on Mike Costello in straight heats in their special 4-mile match race.

Ferdie Mercier and George Lockner tied for honors in the 5-mile open professional events. Mercier won two heats in handy style, while Lockner finished first, second and third in the three heats. In the second heat Mercier had a narrow escape from injury when his handlebars broke. He skilfully guided his machine with one hand and retired from the heat.

BRIGHTON BEACH, August 25.—Arthur Chapple, the local speed king, went down to defeat in the 30-mile race tonight when George Lockner flashed across the finish line a lap ahead of the field.

The 5-mile professional race was productive of an odd coincidence. Johnny Cox, Mike Costello, Ferdie Mercier and Billy Wray finished in that order in each of the three heats, and Cox lowered the time one second in each heat. Cox had to ride his utmost to win each heat.

A new feature was added at the track tonight, namely, a three-cornered match race. George Lockner, Harry Hamilton and Earle Eckel, who made his first appearance, faced the starter. Lockner carried off the honors, winning two heats and finishing second in the other. Eckel made a promising showing, finishing first, second and third in the three heats.

BRIGHTON BEACH, August 27.—Ray Peck defeated Johnnie Albright with ease in the feature 3-mile race at the Brighton Motordrome tonight, capturing the race in straight heats.

PORTLAND RACES.

RACES scheduled for Labor Day in Portland, Ore., were postponed because of unsettled weather. Racing programs are to be given at Vancouver, Wash., September 10 and 15.

THE "MASCO" CATALOG.

ALL standard accessories and supplies and not a few novelties are listed and illustrated in an attractive catalog which is being distributed by the Motorcycle Accessories Company, of St. Paul, Minn. The line ranges from cement to saddles and motorcycle clothing, and every article bearing the Masco stamp, the company's trade mark, is guaranteed to give maximum returns with the smallest reasonable outlay. The catalog will be forwarded promptly on application.

SAMPLE OF TOLEDO SPEED.

THAT folks in Toledo, Ohio, take no chances on having the proverbial grass sprout beneath their sandals has long been acknowledged, but something new in the way of an activity record was established recently by the Consolidated Mfg. Co. when it became necessary to add another building to the already spacious Yale plant. The new structure is to be set aside for the production of bent parts for motorcycles, bicycles and automobiles, and the contractors were notified that the extra room was needed badly.

The material, mostly ironwork, arrived on the ground at 8:30 a. m. on August 13, and at 2:30 p. m. on the following day the frame of the building was practically complete. The two accompanying photographs show the scene "before and after."

A VAN CLEEF EXTENSION.

VAN CLEEF BROTHERS, the Chicago manufacturers of high grade rubber and leather cements, announce that they have found it necessary to build a large addition to their factory at 7707-7711 Woodlawn avenue, and that their output for 1913 will be about doubled. Up to July 1 the firm's sales were 80 per cent. larger than in 1911 and since July 1 the business has been running even further ahead of last year's showing. Van Cleef agents report from all sections of the country that the outlook for 1913 in the motorcycle as well as the automobile supply field is so far beyond anything previously noted that a comparison is out of the question.

"MAKING RIDERS" THE SLOGAN.

MELROSE, Mass., has a unique motorcycle agency at 543 Main street, that city. This progressive concern is the Melrose Motorcycle Agency, who are agents for the Henderson machine. Although this make is the chief one, other motorcycles are handled, and attractively-worded cards are put in the window with the cut of the machines attached. Arrangements are made with neighboring dealers so that the agency can supply any American make at the customer's order, if they do not have it on hand. Machines are shown in the windows from time to time, and this plan is along the general lines of the company's slogan, "Make riders."

Where second-hand machines are concerned, the cards read "Tell us how much you can pay and we will bring to your door the best machine for the money." With the Henderson machine fitted with side-car, an insurance policy against fire, theft, etc., is included in the equipment price.

CANADIAN SEASON OPENS

Fine Motorcycle Display at Dominion National Fair Brings Some Early Business.

TORONTO, Can.—The inauguration of the 1912-1913 season of motorcycle shows took place at Toronto during the two weeks, August 26 to September 7, on the occasion of the holding of Canada's National Fair, the motorcycle display occupying one whole section of the Transportation building.

Seven different lines of motorcycles were shown, the exhibits including the Indian, Excelsior, Pierce, Triumph, P. E. M., Humber and Motosacoche. Two of these the "Detroit Triumph" and the P. E. M., were being shown to the Canadian trade for the first time. A. Shuttleworth, a Toronto dealer, has landed the Ontario agency for the P. E. M., while Walter Andrews, of Toronto, the Canadian bicycle champion, was showing the Triumph. To distinguish the classy-looking mount from Michigan from the English product of the same name, the Dominion trade has christened the new brand "the Detroit Triumph" and the name is taking well. Several English side-cars occupied prominent positions in the booths, these being the center of much interest from the thousands of American visitors to the big fair.

A MEDFORD DEALER.

E. S. BACON, of Medford, Mass., agent for the Harley-Davidson machines, is a full-fledged booster who is making the most of a rapidly developing field. The accompanying picture shows him intently reading the latest issue of MOTORCYCLE ILLUSTRATED. "I was ready to make a hurried business trip when the paper arrived," writes Bacon, "but could not break away until I had looked over the ILLUSTRATED."

A large number of the big men of the Canadian motorcycle fraternity gathered in the city for the "spread." H. W. Kipp, the Indian salesman for the Dominion, returned from a three months' business tour of the country just in time to devote his attention to the show, while a far-off visitor was W. E. Burke, the M. M. and P. E. M. dealer of Moose Jaw, Sask., formerly of Toronto and a retired bicycle champion. K. R. Spencer, of Hamilton, president of the C. M. A., was among the out-of-town delegation and his presence was made use of for the holding of a C. M. A. directors' conference.

The accessories department formed a noteworthy feature of the exhibition. All the tire makers, including the Goodyear, Diamond, Goodrich, Dunlop, North British and United States companies were fully represented, while Red Head spark plugs, Bosch magnetos and Standard speedometers were displayed by their Toronto distributors.

Toronto motorcycle dealers secured a number of fresh 1913 sub-agencies. Percy A. McBride, the Excelsior salesman, landed Carter & Company, of Niagara Falls, Ontario, for the Chicago mount, and incidentally sold a twin seven Excelsior to the Niagara Falls Park Commission for inspection uses.

The announcement was made that the fourth annual motor show for Montreal, Quebec, will be held during the week of January 4, while the Toronto show will follow one month later.

In view of the attractiveness of the motorcycle display at the Exposition, the sociability tour of the Toronto Motorcycle Club, planned for Saturday, Sunday and Monday, August 31 to September 2, was called off. The run is to be held at a later date. It had been intended to ride from Toronto to Windsor and return, a total distance of 500 miles.

The show of motorcycles at the fair formed another big incident in the annals of the Canadian trade, thousands upon thousands of visitors swarming through "Motorcycle Row" during the two weeks. Considerable business was accomplished, a big start being made, in a number of cases, on the transactions for next year.

PLACING EARLY ORDERS.

PHILADELPHIA, Pa.—The Excelsior, Philadelphia's pioneer motorcycle house, has contracted for more than 200 machines to be delivered early in 1913. So far this season 195 machines have been sold at the establishment and the management states that the number could easily have reached the 500 mark had the supply been up to the demand.

HAL P. DAVIS, a motorcyclist of Phoenix, Ariz., rode from Los Angeles, Cal., to Chicago, recently, with little or no trouble.

RIVERSIDE MOTORCYCLE GARAGE.

HEREWITH are shown views of the Riverside Motorcycle Garage, 533 West 110th Street, New York, a description of which appeared in the August 8 issue. The comfortable fittings of the club-room are the admiration of the many visitors to Coughlin's establishment, not to

mention the patrons of the garage itself. One of the rigid rules of the Riverside Garage is that clean towels and ample washing facilities shall be available at all times, and this alone goes a long way toward the ideal in a motorcycle station. It might be also called a "universal" garage, as five side-car outfits have made it their home in addition to two-wheelers.

NEW CLUB HOLDS RUN

Fifty Riders Enjoy First Outing of Recently Organized Indianapolis M. C.

INDIANAPOLIS, Ind.—The newly organized Indianapolis Motorcycle Club, under the leadership of O. F. McClain, president and tourmaster, took its first run on Sunday, August 25, to Noblesville, and return. Fifty riders made the trip, which was a very successful one. The roads were in great condition and as Noblesville is but 26 miles from Indianapolis, the complete round trip was made in the morning. The start was made in front of the club's temporary quarters on the Circle at 9 a. m., and when the riders lined up President McClain handed each one a yellow ribbon on which "Indianapolis Motorcycle Club" was printed.

Nearly all of the riders were members of the club, although the organization extended an invitation to riders in general to join them. There were seven makes of ma-

chines represented in the party, and a friendly trade spirit ruled. The run was gotten up on short notice and everyone was gratified with the showing made. It is planned to have an outing at least twice a month for the rest of the year.

The board of directors is looking for a suitable clubhouse which they expect to find within ten days. G. H. Westing has announced that he will start a \$200 subscription list among the dealers with a donation of \$25 for the furnishing of the rooms. The chances are the club rooms will be in the business district of the city.

On September 14 the club and the Indiana Racing Association is planning to hold a race meet at the Indiana State Fair grounds. The chief event will be the 100-mile race on the mile track. The men who are expected to compete in the race are E. G. Baker, Don Klark, Frank Houff, Chas. Herrman, Frank Marshall, Thurman Constable, L. S. Taylor, Noble Shepard and a number of others from neighboring states.

CLEVELAND NOTES.

IT is in the air in Cleveland that the *Pittsburg Press* is to hold another road race from Erie, Pa., to Pittsburg. Kumlner Brothers, who piloted the Reading-Standard team in the last race from Cleveland to Pittsburg are going to enter the same team again. Hard luck in the other race lost the team a place in the finish.

ALL Indian riders of Cleveland are preparing to enjoy themselves on the second Sunday of September. The secret is not out as yet, but it is hinted that "Looie" Mueller is to entertain the boys after a short run.

GEORGE KAUFMAN, of Woodland avenue, has received several of the 1913 Triumphs. George is busy giving demonstrations daily, and has disposed of several of the machines.

THE West Side Motorcycle Company, the Harley-Davidson branch of the Lister Motorcycle Company, has disposed of nearly 75 machines on the West Side this season. This is three times the number sold during the same period last year.

THE K-V Motorcycle Company, with George Knapp at the helm, has placed 17 Hendersons on the streets of Cleveland, despite the late start in the season.

NEW riders announced at the Luna Motordrome are Charles Glenn, of Toledo; W. S. Witherspoon, of Cleveland; George Flash, of Buffalo, N. Y., and Eddie Holsinger, of Canton, Ohio, all of whom will be seen in action from now on.

BERT BROCK and G. W. Drench left Cleveland recently on a two-weeks tour. New York being the destination. Brock rides an Excelsior and Drench a Flying Merkel.

THOMAS F. STONE is making a trip from Granite City, Ill., to the Pacific Coast on his motorcycle.

Branch No. 7, Edwards & Crist, 3143 Logan Boulevard, Chicago.

MANUFACTURERS

TO OPEN FOREIGN BRANCHES.

AFTER popularizing its product in every State of this country, the Goodyear Tire & Rubber Company, of Akron, Ohio, manufacturers of the famous No-Rim-Cut automobile tires and Blue Streak motorcycle tires, is making preparations to open up branches in several of the countries in Continental Europe, in England with head offices in London, and in South Africa and Australia.

On September 5, L. C. Van Bever, of Toronto, Canada, vice-president of the Canadian company of the Goodyear Tire & Rubber Company, left for England, to complete arrangements for the opening of the London branch, and to establish a complete distributing system throughout the British Isles. Mr. Van Bever, will form an English company of the American house. This will control the British interests of the company as well as those in South Africa and other British possessions. Other companies, it is understood, will be organized under the supervision of Mr. Van Bever in France and Germany, and arrangements are being made to form a company in Australia to supervise the business on that continent and in New Zealand. The plan is the beginning of a world-wide selling organization and distributing system of the Goodyear Tire & Rubber Company. For the present automobile tires and other products will be manufactured at the Canadian plant of the company and shipped to the various points abroad for distribution.

NEW MODEL ARRIVES.

THAT Frank Libbey Valiant, purveyor of general publicity for the Flying Merkel interests, knows a really important bulletin when he sees it is evidenced by the following wire, received a few days ago:

"1913 Flying Merkel out today. Specifications as follows: Single cylinder; without muffler; very noisy; runs all night without stopping; color pink; tires—never. Prettiest model Joe Merkel ever designed. Everybody enthusiastic. Weight, 10½ pounds. It is a baby girl."

SIDECARS AND TANDEM ATTACHMENTS.

PROPHY side-cars were 'on the American motorcycle market in 1908; we note in our spring number for that year an announcement of a side-car attachment for the Erie motorcycle, priced at \$38 and both side-car and tri-car attachments for the N. S. U. and F. N., the latter being then handled by the Ovington Motor Co., New York. The Manson was another model of this type. Tandem attachments were listed by the Curtiss and Excelsior firms. In later issues, that year two excellent articles on the pleasure and commercial use of side- and tri-cars were written by Earle Ovington and George Sherman.

A HANDSOME STRUCTURE.

A NEW atmosphere has been created along New York's automobile row by the completion and occupancy of the United States Rubber building at Broadway and 58th street. This structure, twenty stories high, is the tallest north of Forty-second street. It is to

serve as a permanent home for the United States Rubber Company and its subsidiary companies, of which the United States Tire Company is one. The latter organization occupies the fifteenth, sixteenth and seventeenth floors as its general offices, while the street floor is given over to the New York branch.

The exterior of the building is unusually attractive. A rather free Renaissance treatment was followed in the outside finish, with modifications to meet modern conditions. Because of the height of the building it was realized that the entire facade could not be embraced at a glance, hence a two-part design was car-

ried out. The lower part of the building is far more elaborate than the upper.

The material used in the two fronts is white Vermont marble, similar in general effect to that used in the New York public library. Each of the twenty floors contains approximately 6,300 square feet, undivided. Subdivided, each floor provides 17 offices, varying in size from 280 square feet to 630 square feet. The building is fireproof throughout and the elevator equipment consists of six fast cars.

SPECIAL MINNEAPOLIS TYPE.

MINNEAPOLIS, Minn.—One of the first of the Minneapolis tricars purchased for use in the collection of mails throughout the country has been seen on the streets of this city, undergoing a very thorough test, and has created a great deal of interest. This outfit is painted a very attractive maroon, and is equipped with a starting crank, two sets of footboards and foot brake. One set of footboards is the ordinary service set used in riding, and the other set is mounted forward so that the operator can stand up well forward on the car, take mail from the letter box and drop it into the van of the tricar without dismounting. It is understood that all future cars on this order will be painted the same maroon color, as that shade is looked upon with favor by the Postmaster General.

BACK TO THE OLD STAND

T. N. BIDDLE, generally known as "Bid" by the trade from coast to coast, has returned to the employ of the Eclipse Machine Company. Biddle was employed by the Eclipse Company from 1895 to 1909, when he left to enter the employ of the New Departure Company. The Eclipse people believe him to be the best informed coaster brake man in the trade and are glad to have him back at the old stand. Biddle started to travel for the Eclipse Company again September 1.

LEAVES MOTORCYCLE FIELD.

EDWARD F. LEINBACH, a well-known bicycle and motorcycle enthusiast, has resigned his position with the Reading Standard Co. Mr. Leinbach has been connected with the Reading Standard Co. for the past seven years and took great interest in the motorcycle trade. He first served as bill and order clerk and later was promoted to sales manager. Leinbach has accepted a position with Luria Bros. & Co., brokers, in Reading.

FOREIGN AGENCIES.

ARRANGEMENTS have been made by the Henderson Motorcycle Company, of Detroit, for the establishment of an agency in Montevideo, Uruguay, Luis Daglio being appointed representative there. An agency in London, England, is announced to have been taken by the Robertson Company.

Gathering of Pope traveling staff at the home offices in Hartford. Seated—H. M. Musselman, H. C. Lyman, T. R. Carpenter, O. Gudenschwager. Standing—Jos. Redlinger, F. L. Hamer, M. G. Littlefield, B. A. Edgar, W. B. King, Jr., D. S. Ryan. Top centre—R.

COFFMAN LEAVES CONSOLIDATED.

CONSIDERABLE surprise and no little regret have been occasioned in trade circles by the announcement that A. B. Coffman, for the last twelve years the most potent factor in the upbuilding of Yale business, has tendered his resignation as vice-president and sales manager of the Consolidated Manufacturing Company, of Toledo. Mr. Coffman gave notice at a meeting of the board of directors of the company on August 22 that he would withdraw on the expiration of his contract, which terminated August 31. He states that his plans for the future are as yet incomplete.

THE IMPROVED MOTORETTE.

AN attractive new catalog issued by the Kelsey Motor Company, of Hartford, Conn., makes the announcement that the Motorette, the sturdy three-wheeled machine which came into prominence some time ago through an endurance trip from Hartford to San Francisco, is again being manufactured. The C. W. Kelsey Manufacturing Company, original makers of the Motorette, suspended business, and the firm's affairs have now been taken over by the Kelsey Motor Company.

A VETERAN'S OPINION.

THE Wilson Brothers Company, agent for the Pierce machines in Boston, Mass., is headed by John W. Wilson, one of the first professional bicycle riders in America. When the first dependable motorcycles appeared the veteran athlete predicted that the motorcycle field would in time develop far beyond the scope of the bicycle, and he reports that Boston is doing its share to bear out his prophecy.

POPE SALESMEN MEET

Big Staff Spends Two Busy Weeks Mapping a Record Campaign for 1913.

THE force of traveling men who sell Pope bicycles and Pope motorcycles to the trade in all parts of the country recently held their annual convention at the home offices of The Pope Manufacturing Company in Hartford, Conn., and at the factory in Westfield, Mass. As a number of new men have recently been added to the sales force, the attendance was considerably larger this year than last. The Pope salesmen spent the first week at Westfield in doing practical factory work and mastering the technical details of

bicycle and motorcycle manufacturing. The second week was given over to conferences and talks on salesmanship at the company's executive headquarters in Hartford. At the conclusion of the conference the salesmen all agreed that never before had they put in such a profitable and pleasant time at an annual convention.

The salesmen's conference at Hartford during the second week were unusually lively, for with the company's volume of business increasing so rapidly, there were many things of importance to discuss. President Albert L. Pope attended many of the conferences and took an active part in the proceedings. L. D. Harden, manager of the bicycle and motorcycle sales department presided. The company's purchasing agent, J. P. Fogarty, gave a particularly instructive talk.

The last event of the second week was the annual dinner at the Hartford Golf Club, on Friday evening. President Pope presided and Col. George Pope was toastmaster. Other officers of the company, heads of departments, and correspondents also attended.

The salesmen at the convention included D. J. Ryan, New England representative; R. H. Smith, New York and New Jersey; M. G. Littlefield, Indiana and Illinois; Joseph Redlinger, Louisiana, Alabama, Mississippi and Texas; H. M. Musselman, Ohio and Michigan; Otto Gudenschwager and T. R. Carpenter, Wisconsin, Northern Michigan, Minnesota, North and South Dakota; F. L. Hamer, Virginia, North Carolina, Maryland, and Delaware; H. Lyman, Southern New Jersey, Pennsylvania, and West Virginia; W. B. King, Jr., Kentucky, Tennessee, Arkansas, and Missouri; T. B. Hallborg, South Carolina, Georgia, and Florida, and B. A. Edgar, salesman for the jobbing department.

New Home of the Merkel Motor Company in Indianapolis.

THE CLAUDEL CARBURETER.

JUST what difference a change of carbureter makes in regard to speed, for example, has been demonstrated by the performances of Mike Costello on his Merkel racer at recent meets in the East. Costello's mount is of 1909 vintage and he was generally outclassed when competing with 1912 racers, but the fitting of another carbureter resulted in numerous wins, particularly on July 24, when all the Class B pro events were taken by him. The carbureter in question was a Claudel, made in France, and fitted by the American agency, Livingston, 1779 Broadway, New York City.

Most riders are familiar with a carbureter that has auxiliary air valves and primary air, the former operating by a valve and increasing the air in the mixture as the speed of the motor rises. In the Claudel carbureter, however, the necessary air for weakening the

Claudel Motorcycle Carbureter.

mixture as the speed increases is regulated mechanically by the movement of the throttle only, all springs and moving parts having been done away with. The primary and secondary air of the ordinary carbureter are combined in one stream which passes over the jet, and in conjunction with the characteristic Claudel jet give what are considered ideal conditions in carburetion: lean mixture at high speeds, slightly richer mixture at low speeds, and rich mixture for starting. Starting is thus easy, the motor can be run slowly when idling, will pick up quickly, and give maximum power and minimum consumption at all speeds.

The throttle is of the barrel type and is rotated by means of a lever operated from the handlebars. At opposite sides of the barrel are cut two openings, the upper being circular with a V-shaped slot in addition. The lower opening is of peculiar shape; the main portion is circular but there are also two wing-openings and a long finger-shaped extension on one side and on the other a very long V-slot, the combined forms being continuations of each other. The upper opening leads to the connection to the motor, while the lower opening surrounds the upper portion of the jet, leaving an air space all around the latter. When the throttle is closed, the jet fits in the rounded end of the finger-shaped extension opening, while only the tip of the upper V-opening gives communication with the motor. This gives a maximum suction over the jet for the small throttle opening, and the mixture is thus rich. As the throttle is opened, the wing-shaped apertures surround the jet and the circular upper opening is more exposed, thus giving less suction on the jet and more throttle. When the throttle is fully open, the

passage through the barrel is circular at both openings and the suction is reduced and air increased.

With an ordinary open jet, the result would be improper mixture at the higher speeds, but the Claudel jet construction prevents this. The jet has an opening at its upper end, but is surrounded by a sleeve having two series of openings, one at the top opposite the jet opening and the other near the bottom. The jet is thus enclosed in a column of air which controls by its velocity the flow of the gasoline. The velocity of this air column depends on the inrushing air in the carbureter, producing a depression at the upper openings and causing air to enter the lower series, flow upward inside the sleeve and out at the upper series. At moderate speeds, the velocities of the outside and inside columns of air are approximately equal, but as the motor speed increases the inside column of air is prevented from increasing at the same rate as that outside, due to the friction of the openings at the top and bottom of the sleeve. A lean mixture at high speeds is thus obtained. The jet working with the throttle gives a scientifically correct amount of mixture for the motor to which it is fitted.

There are two throttle adjustments: an air-screw at the bottom of the throttle chamber for regulating the minimum opening of the throttle, and a by-pass or gas-screw permitting the motor to idle with the throttle practically "closed." These adjustments are made when the carbureter is fitted to the motor and remain fixed without regard to temperature or atmospheric conditions. The jet and its body screw into the air-passage from below and are readily removable by unscrewing

The Spray Nozzle.

a plug at the bottom of the carbureter. A filter is fitted above this plug and held up against the lower part of the jet by a spring, thus preventing jet-clogging. Another filter or strainer is fitted below the needle-valve in the float chamber, giving a second preventive against clogging by foreign matter.

Other parts of the carbureter are up to the excellent construction of the jet, throttle, etc. The float chamber has a readily-removable cover held in place by a spring lever, and the float and bascules can be taken right out together. The float is a hollow metal one and surrounds the needle-valve. Priming, when necessary, is done by lifting the projecting end of the needle-valve.

The general construction follows the highest carbureter engineering principles and the effectiveness of the instrument on motorcycles and automobiles has been demonstrated abroad for several years. Claudel carbureters figure prominently on most of the record-holders of the speed-world, and as regards economy, in numerous efficiency and fuel-consumption competitions.

HOQUIAM RUN TO TACOMA

Washington Riders Found Good Roads, But the List of Perfect Scorers Was Small.

TACOMA, Wash.—A week after the run made to Hoquiam by the Tacoma Motorcycle Club, the Hoquiam club returned the compliment by making their first endurance run to Tacoma, on Sunday, August 25. The riders began to arrive in "The City of Destiny" shortly after 10 o'clock from the Gray's Harbor City and continued to check in until almost noon. A large number of members of the Tacoma club greeted them at the checking depot at Tenth and Tacoma streets, where they were checked in by Ray E. Day, an official of the Tacoma club.

Those who arrived in time were H. P. Luce, Edward French, C. J. Ritchie, Clyde Lewis, William B. Ogden, Ray Kimball, E. A. Truitt, C. B. Prentice and Henry Millafer. The riders reported ideal weather and excellent roads along the route of the run. On the return trip it was found that but five out of the 16 who started arrived in Hoquiam Sunday evening on schedule time. Only two, however, recorded perfect scores at all checking stations. They were Clyde Lewis, riding a Merkel and Edward French, a 17-year-old rider, on an Indian twin. The other three on time were L. L. Luci, on a Flanders; C. J. Ritchie, on an M. M., and E. A. Truitt, on an Indian.

Two accidents occurred on the run. James M. Anderson ran into a cow on the road beyond Gate and was injured. R. M. Streater, after losing his way beyond Gate, finally returned to that place and took a new start for Olympia with only 20 minutes in which to make 18 miles. He was driving at a terrific rate and when several miles outside of Gate lost control of his machine on a sharp curve and was thrown heavily, being rendered unconscious for a few minutes. He was badly bruised and his machine was smashed.

A NEW 24-hour record has been made by an Australian motorcyclist, P. O'Brien, who rode 522 miles. Five hundred and seventeen miles was the previous record for a full day.

The Free Wheel Control

HARLEY-DAVIDSON FREE WHEEL CONTROL

ANY Harley-Davidson dealer will **PROVE** by **ACTUAL DEMONSTRATION** that the Harley-Davidson will *outpull* any other make from a standing start, on the level or on a hill, and with either one or more riders.

The Free Wheel Control is located in the rear wheel because that is the only place there is room to make the parts large enough to do the work demanded, and its location and construction insure easy starting without any chance of stalling the motor.

As no oil or grease is used on the contact surfaces there is nothing to soil the rider's clothing—**AN IMPORTANT POINT.**

The Free Wheel Control runs on ball bearings—big ones—with three inch races. The thrust bearing is a ball bearing too, with a two and three-quarter inch race—large enough to hold a 30 H. P. motor.

The contact surfaces are **BURN PROOF** and they work on hardened steel plates—there is nothing else to wear out

The Free Wheel Control is patented. The United States Government has allowed every claim we asked for in our application for patents, showing that the Government recognized the Free Wheel Control both as radical and important.

Now everyone **KNOWS** what the Free Wheel Control can do and **WHY.**

Harley-Davidson Motor Company

265 C Street

Milwaukee, Wisconsin

TRICARS IN POSTAL SERVICE.

IN the accompanying photographs is shown one of the first Minneapolis tricars to be placed in service for the collection of mail in Washington, D. C. The machines have attracted much attention, and it is announced that their work under severe tests has been uniformly satisfactory. The picture at the left shows the left side of the machine and displays the two sets of foot brakes; the view at the right shows the starting crank and foot brake, and the photograph below was snapped while the machine was being driven up a 30 per cent. grade in its final test by government officials.

ELEVEN RIDERS FINISHED.

SOME of the worst roads in Missouri were included in the route of the third annual reliability run of the South Side M. C., of St. Louis, which was held on Sunday, August 11. Twenty-six riders entered the contest and 11 finished. Fred Garst carried off first prize, a handsome cup; H. Johnson, in second place, was awarded a gold F. A. M. pin; T. Bahnsen received a silver medal, and each of the other finishers received a medal or a motorcycle accessory.

WANTS AMERICAN MACHINES.

W. G. HANDCOCK, of Melbourne, Australia, writes that he is desirous of representing American motorcycles for Australia and New Zealand. He has had over twenty years' experience as a manufacturers' agent and has successfully han-

CYCOMO SIDE-CAR.

THREE views of the new Cycomo side-car, manufactured by the Cuyahoga Motorcycle Company, of Cleveland, Ohio, are given in the accompanying photographs. It will be noted that the attachment is extremely simple in construction, and correspondingly light and strong. The frame is oxy-welded and interchangeable bronze fittings are used for attaching. One of the features is a patented flexible seat which has a tendency to conform to the body of the passenger. Another point is that the skeleton construction of the side-car reduces wind resistance to the minimum, and allows for extra speed.

RACES AT ELWOOD FAIR.

ELWOOD, Ind.—So popular has motorcycle racing become here that the Elwood Driving Park & Racing Association included races in the program at the local fair. There were nine machines entered in a ten-mile event. Baker, the professional rider of Indianapolis, was to have given an exhibition, but his machine, which had been shipped, failed to get in on time and the large crowd, which numbered over 5,000, was deprived of this interesting feature.

dled motorcycle and automobile lines to date. Manufacturers desiring to communicate with him should address him, c/o Messrs. J. Hewitt & Co., 2 Lime Square, London, E. C. A representative of Mr. Handcock will make a business trip to this country in the near future.

RACES, baseball game and other sports, combined to make the annual picnic of the Rochester Motorcycle Club a huge success.

The Cycomo Side-Car. Light and simple extra passenger attachment made by Cleveland Concern.

Repair shop records show that the wrist pins and connecting rod bearings are the first parts of your motor to feel the effect of improper lubrication.

Both of these parts are out of sight.

The motorcyclist cannot tell whether they are properly or improperly lubricated until the trouble comes. When it does come, the trouble is serious.

That indicates the importance of selecting the right lubricating oil in advance.

The correct oil can't be determined by simple tests. The motorcyclist must rely on authoritative guidance.

In producing Gargoyle Mobiloils, we made a detailed study of the motor construction of every American motorcycle and many foreign makes. The several grades of Gargoyle Mobiloils are made to meet the individual characteristics of each type of motor.

Our chart of recommendations (printed on the right) shows the correct grade of Gargoyle Mobiloil for each make and model of motorcycle.

In buying Gargoyle Mobiloils, you will find the grade indicated on the can directly below the Gargoyle (our mark of manufacture), and the word "Mobiloil." By buying in barrels, half-barrels, five or one-gallon cans, you can always be sure that you have the correct oil and the correct grade for your motor.

The various grades for motorcycles,

refined and filtered to remove free carbon, are named:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "Arctic"

They are handled by the higher class garages, automobile supply stores and others who supply lubricants.

This list shows the right oil for your motorcycle.

Explanation: In this schedule the letter opposite the name of motorcycle indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." Recommendations cover all types of the same make unless otherwise stated.

VACUUM OIL COMPANY, Rochester, N. Y.

General Sales Offices, 29 Broadway, New York City

DISTRIBUTING WAREHOUSES IN THE PRINCIPAL CITIES OF THE WORLD

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

IN THE PHILIPPINES.

FROM Manila, P. I., where the motor two-wheeler is making rapid gains in popularity, come the interesting photographs reproduced on this page. They are forwarded by Edward D. Gavagan, sergeant of the first class in the U. S. Army Hospital Corps at Manila. Sergeant Gavagan has been a motorcyclist for some time past and his experiences on the island roads have not been lacking in thrills. Some of the highways are described as natural boulevards, such as the one shown in picture 2, but others—by far the greater number—are of the type depicted in the first illustration. For some time after the first motorcycles appeared in Manila the natives approached them with great reluctance, but a few of the Islanders are now numbered among the riders.

Picture No. 1 shows a bad spot on the road near San Ildefonso; No. 2 is a picturesque bridge on the way to Sibul Springs; No. 3 gives a view of a street in Tiaong, Tayabas, and No. 4 shows another section of the same "thoroughfare"; No. 5 shows the baths at Sibul Springs, and No. 6 is a view in Manila—the north road, looking toward Bagio.

MOTORCYCLE MART

One time, three cents a word; twice, two cents a word each insertion. Agents' cards, five cents per word; two or more times, three cents per word each insertion. No advertisement for less than fifty cents.

Diamond

SEAL-TITE

will assure you of greatly increased mileage from your tires

It is a putty-like uncured gum that is kneaded into a cut after the cement has been applied. This is done at your own home—no bother and inconvenience of sending your motorcycle away or fussing with a vulcanizer. Seal-Tite fills up every bit of the hole. It is self curing and when set becomes a part of the tire itself. Water and dirt find no place for their destructive attacks after Seal-Tite has been applied.

Seal-Tite and the cement used with it are packed in separate cans. These fit into a combination can $2\frac{1}{4} \times 5\frac{1}{2}$ inches.

"Old Sol" No. 8 is the Hercules of Motorcycle Lamps

Both in strength of construction and strength of light projection, "Old Sol" No. 8 stands head and shoulders over any other motorcycle lamp.

Handsome, massively built of heavy gauge brass, with a mangin mirror lens highly ground to our own dioptics, it is truly a "Hercules" among lamps.

Fifteen Hundred Candle Power light projection! Think of it! Not the dull, weak glow of the ordinary lamp, but a powerful piercing ray of white light. "Old Sol" adds "tone" to any motorcycle. It makes it look "like business."

TRADE MARK
Diamond Chain & Mfg. Co.

227 W. GEORGIA STREET, INDIANAPOLIS, IND.
8,000,000 FEET PER YEAR

TO the dealer who has his finger on the pulse of the 1913 motorcycle market, there is a world of significance in the fact that our next year's model will have **little or no changes.**

We are satisfied that the R-S is as far advanced on the high road to complete motorcycle perfection, in its present make-up, as any 1913 model will be—if not more so.

While we cannot improve the motorcycle we **may** improve its appearance. But that's a matter of discussion just now. Suffice it to say that we're satisfied with the present models of the R-S.

If you'll give yourself a chance to learn more about it—the R-S will satisfy you also. **Write for our catalog;** it states clearly and concisely the points of R-S superiority.

READING STANDARD CO., 306-340 Water St., Reading, Pa.

The Baxter Side Car

Strong—Because of its re-enforced frame-work, its solid Bessemer steel hub spindles, its scientific construction throughout.

Light—Weight is less by 20 lbs. than that of any other side car made. This is due to the proper distribution of weights.

Comfortable—Its deep leather cushions and its patented tension spring wheel tend to make the Baxter Side Car the acme of comfort.

Dealers write for our 1913 proposition

CHICAGO, ILL.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

Economical tire buying is simple—all there is to it is to see that you get the *most* in service and satisfaction.

Almost any tire will give ordinary service, but ability to deliver maximum mileage has a vital bearing on ultimate cost.

Shrewd motorcyclists find that the matter of satisfactory tire service hinges entirely on tire quality.

Discriminating in the selection of tires is real economy—it results in longer wear without added cost.

FEDERAL TIRES

The Tires of "Extra Service"

Federal Tires are the kind that last a long time—durability is the leading feature about them. They are extremely well made of the finest and most carefully selected materials. Every Federal Tire has *extra* service built into it. For the sake of comparison, try them.

Federal Tires are made in Corrugated and Studded treads in all sizes and in single and double clinch types. They are supplied through leading dealers everywhere. Interesting tire book mailed on request.

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of June 13 is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I am planning to take a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and I am looking forward to a very pleasant trip.

Yours very truly,

B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waking & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,

CHAS. A. TANGEMAN.

The Neverout

TRADE MARK

Gas Lighting Outfit

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

A REVOLUTION IN MOTORCYCLE MOTOR DESIGN

In bringing out our DE LUXE line of motorcycle motors, we have introduced a large number of improvements, and offer these motors as the most advanced now before the trade.

NOTEWORTHY IMPROVEMENTS.

One piece crank shaft.	Simplified design throughout.
One part crank case with cover.	Reduced number of parts.
Improved cam and magneto drive.	Quiet running motor.
Oil tight motor.	Large Ball Bearings mounted in steel lined pockets.
Large Valves.	

Equipped with Bosch Magneto.

These improvements in design, together with the high grade materials used in construction, the modern methods of manufacturing applied, and the remarkable performance of these motors in road tests mark a revolution in motorcycle motor building.

POPE "BIG 4" A New Standard of Single Cylinder Efficiency

\$200

With Magneto Equipment, Free Engine Clutch, Idler, and Many Exclusive and Desirable Features.

Motor with valves in the cylinder head, interchangeable and mechanically operated.
Offset Cylinder, eliminating dead center and giving maximum power at slow speed.

Clutch and Idler worked by one lever.

Overhead Valves and Increased Power

In the POPE "BIG 4" are found several features of marked originality, chief among which is the novel practice of locating the intake and exhaust valves in the center of the cylinder head. Long experience in building powerful gasoline engines for Pope-Hartford automobiles convinced us that a properly designed motorcycle engine with overhead valves would develop considerably more power than any other motor of its size.

The POPE "BIG 4" conclusively proves the desirability of an engine so constructed. It sets a new standard for single cylinder efficiency and power.

THE 1913 DE LUXE

THE CROWNING ACHIEVEMENT
IN MOTORCYCLE PERFECTION

7 H.P. De Luxe Twin, \$275

9 H.P. De Luxe Twin, \$285

To the critical and discriminating buyer who, regardless of the tendency toward "cut prices" and cheaper machines, wants "something better" we offer the 1913 De Luxe.

It is the tired man that enjoys a rest, and it is to the dealer worn out from delayed deliveries, faulty material and slighted workmanship that we are most anxious to SHOW the De Luxe.

The successful dealer requires a machine that sells readily and stays sold.

The tangible and dominant superiority of the De Luxe makes ready sales and the reliability, comfort and service makes every buyer a booster.

The features that make the De Luxe predominant as the "better motorcycle" are of real practical value and fully appreciated by the experienced motorcyclist and dealer.

We want to send our 1913 advance circular to every live dealer and motorcycle rider. Write for it today. A postal card will get it.

We are now closing contracts and allotting territory for 1913 and can make deliveries in any desired quantities.

Correspondence with dealers solicited.

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and giving maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen $\frac{1}{4}$ -inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

THE NEW DEPARTURE MFG. CO., Bristol, Conn.

COASTER BRAKE LICENSORS

The silent, vibrationless, 4 cylinder, 7 H. P. Henderson—\$325

HENDERSON MOTOR CYCLE

In the Henderson, the rider gets real comfort, silence, plenty of power that is truly flexible, an engine that starts with a crank and runs free.

In the average machine he gets none of these—but a machine that is very little more than a motor-driven bicycle.

So it is just the question of choosing between the two—a machine you'd really enjoy, or one that produces principally noise and discomfort.

Once you see the Henderson and feel it under you, even that question will be swept away.

Look up the dealer.

HENDERSON MOTORCYCLE COMPANY, 1158 Cass Ave., Detroit, Mich.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

Road washed out completely by cloudburst at Van Dyne. Notice the torrent of water crossing the road. One rider of another make is shown in the act of throwing water on his engine and clutch to cool them off. Notice the cloud of steam from the hot motor and clutch. Many riders never got past Van Dyne and the contestants commenced shipping their machines to Milwaukee ten miles back of Van Dyne. One of the Harley-Davidson riders is shown in the background riding through the water—he never stopped his motor in the stretch of water shown—didn't even get off his machine.

Riders checking in at Fort Atkinson, the noon control the first day.

The Harley-Davidson in the

Total Entries, 106; Harley-Davidson Entries, 25;

THE Harley-Davidson machines were the sensation of the tour. The Harley-Davidson singles went where twins of other makes stalled, and the Harley-Davidson twins went up hills and through mud that seemed absolutely impassable.

The Free Wheel Control enabled the Harley-Davidson riders to go through difficult places without racing their motors to the point of overheating. Not one Free Wheel Control went out of business on the whole trip, whereas the clutches on several machines of other make were the direct cause of the riders being put out of the running.

One of the perfect score Harley-Davidsons towed a competing machine of another make into Oshkosh after its clutch had gone out of commission in the mud between Ripon and Oshkosh.

A rider of still another make gave up in disgust the last day and took the train into Milwaukee when his clutch went to pieces, and still other riders were encountered time and again on the road with their clutches taken apart, almost frantic in their efforts to "dope" them up enough to enable them to finish. It is significant and noticeable that no such nursing or repairing was required by the perfect Harley-Davidsons.

No Harley-Davidsons had motor trouble, while at least one competitor was put out by a seized motor. Not a Harley-Davidson broke a chain on the whole tour, in spite of the terrific strain placed upon the transmission, proving again that large sprockets, in connection with the Free Wheel Control, make a transmission system for twin cylinder machines difficult to improve upon.

With some riders of other makes broken chains seemed to be the order and not the exception and, seemingly not enough handicapped with such troubles, one of the riders broke the crank shaft the second day and rode the balance of the run on a borrowed machine up to within three miles of the finish when his borrowed machine sheared off a driving sprocket.

At least four Harley-Davidson riders stated that they would never have completed the tour if their machines had not had Ful-Floteing Seats.

The tire car which accompanied the tourists was obliged to cut around the course at Theresa. The roads were impassable. Two miles out of Theresa the riders came across an automobile which had attempted to get through—it was abandoned, and a rear axle broken off clear, right next to the wheel, was mute evidence of the awful struggle the four-wheeler had had with the fearful roads—but the Harley-Davidson went through that mud.

Between Mayville and Iron Ridge the road was so bad in one place other riders put their machines through a barbed wire fence and rode through a field of grain. The Harley-Davidson went through that road, too.

Noon Control at Beaver Dam the second day. Out of Beaver Dam the heavy going really began.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

THE MOST STRENUOUS TEST FOR MAN and MOTORCYCLE EVER ACCOMPLISHED

From Portland, Ore., to Portland, Me., via the Southern Route—5,964 miles—is the remarkable trip that has just been accomplished by Jos. P. Schantin, of the former city. Schantin is now on his way back to Oregon, via the Canadian Route, and at last reports had reached Milwaukee.

Not once during this arduous journey has Schantin experienced the slightest mechanical trouble of any nature whatsoever, his Flying Merkel pulling him through desert sand, over mountain ranges and through mud that would stall most engines, without a miss in its rhythmic purr. Most remarkable of all is the fact that Schantin has the use of only one leg. Therefore, his machine was put to an extraordinary racking test, as his motor had to pull the rider and baggage at all times without pedal assistance. Another rider on a different make machine started with Schantin, but for a multitude of reasons gave up the journey while crossing one of the deserts of California.

The same kind of day-in-and-day-out service is yours for the asking.

"During the past seven years I have used all makes of Tires and find Continental-Erie the best"

CONTINENTAL RUBBER WORKS, Erie, Pa.

Chicago, Ill., August 14, 1912.

Gentlemen: Just a line to let you know what I think of the Continental-Erie Motorcycle Tires. I have been riding a motorcycle for the past seven years and during that time have used all the leading makes of tires. I have never found any tire that has given me the service that the Continental-Erie Motorcycle Tires have given me. At the present time I have a pair of these equipped on my machine that I have used for over 4,000 miles, the majority of this distance having been ridden with a tandem attachment and another party on the machine over country roads.

These same tires I have also used in Race Meets and Endurance Runs and they have never given me any trouble.

Continental-Erie Tires are without question the very best tires that I have ever ridden. They having a very tough and resilient tread, make a very easy riding tire and they have always given me excellent service.

Wishing you continued success with your tire, I am, very truly yours,

B. M. BLANKENHEIM.

NON-SLIP-LAG

The new lining for pulleys. It absolutely prevents belts from tearing and slipping; increases their life and affords additional power. Non-Slip-Lag can be applied without removing Belt or Pulleys. No Screws or Metal Parts are required to hold Lag on Pulley. Non-Slip-Lag is now being used exclusively by the Eolipae Machine Co., on the Eolipae Free Engine Pulley.

CONTINENTAL RUBBER WORKS - ERIE, PA.

Another new model—

a model that is described with every truth as "the Pullman of saddles."

Such is the

BROOKS B 401

—the saddle which meets the needs of the present-day motorcyclist better than any other saddle can.

Being anatomically shaped, you sit IN it rather than ON it, and the fact that the BROOKS, the original and only genuine Compound Springs, are placed under the weight-carrying portion of the seat, and that the latter is not hinged at any fixed point at the peak, ensures that every movement of those springs will be in a true vertical direction.

That means even greater comfort—luxury, in fact—and if that's your desire you should have it fitted to your present mount.

JONES SPEEDOMETERS FOR MOTORCYCLES

Model 831 — \$20

Know your speed. Record your mileage. Get the real enjoyment of motorcycling by using an accurate speedometer. The JONES has no equal for accuracy. It gives excellent service, is built to withstand all vibration, constructed by skilled instrument makers, easily and quickly attached to any machine.

Used by Motorcycle Policemen

The JONES is used by the motorcycle police in all large cities. It is selected because of its accuracy and ability to withstand day-in and day-out service **every** day in the year. The JONES costs no more—and in some cases not as much—as other speedometers which lack the accuracy of the JONES.

It's A Habit With the Yale

The Yale Wins, One---Two---Three in 24 Hour New Jersey Endurance Run

The Yale team, composed of P. W. Stevens, Ortie Stevens and George Riechey, made a perfect score in the 24 hour endurance run of 325 miles through New Jersey and New York, September 15th-16th.

Through the back-breaking hills of North Jersey, through sand and mud, Yale superiority again asserted itself. Each control was reached with time to spare. Twenty-eight riders started, sixteen finished. The Yale team was again the only team with a perfect score. With one machine after another dropping out with broken frames, forks, valves, and various other ailments, the Yale team still

kept to the fore, easily overcoming every obstacle that arose in their path. Perfect lubrication, perfect transmission, perfect cooling—these partly explain why the Yale can be depended upon always to make a perfect score. But the real secret of Yale perfection is that from mudguard to steering post, every part of the Yale is constructed with the one aim in mind—**QUALITY AT ANY COST.**

Victorious Eastern Team

The Yale "Doos It" Again!

Sweeps Field in Tri-State 400-Mile Endurance Run

Three Yales entered and three Yales finished with perfect scores in the two-day endurance run from Middletown to Elyria and return going through Ohio, Indiana and Kentucky, August 31-Sept. 1.

The Three Yale Riders Were the Only Perfect-Score Team

While other machines were put out of commission with every trouble that can possibly overtake a motorcycle, the Yale team slid serenely along. Although the thermometer sometimes registered from 95 to 100 and above, the Yale motor with its horizontal flanges showed no sign of overheating. The Yale cool-

Campbell—Squier—Meyer

ing system is trouble proof. In the hottest weather Yale lubrication was perfect. The gear pump kept all parts perfectly oiled at all speeds, without particular attention from the rider. Get this! Three Yales entered—three perfect Yale scores—through three states, over 400 miles, and all Yales perfect.

**Like a Twin
But Smoother---**

The

Schickel

Valveless Two-Stroke Motor

Delivers a power impulse with each stroke of the piston.

The two-stroke motor steadies the drive,—power is transmitted to the rear wheel constantly and noiselessly.

There is not a valve to bang shut or a gear to grind out an unpleasant sound.

The absence of back lash (lost motion) between the three moving parts produces a mechanically noiseless motor.

The Schickel Motor gets down to its work without a murmur.

You don't have to fly at steep grades,—when the hill is reached, jam on power.

With bulldog tenacity the Schickel Valveless Two-Stroke Motor will hang on where others stall.

This is the motor which we install in Schickel motorcycles. For hard going, for day in and day out service you will need a Schickel.

Write to-day for Illustrative Description.

SEPTEMBER 19, 1912

THORNLEY ON THE NEWARK ACCIDENT

Competition Committee Chairman Opposes Limiting Power of Machines

AFTER visiting the Newark Motordrome and making a careful investigation into the conditions leading up to the accident which snuffed out the lives of Hasha, Albright and six spectators, Chairman J. P. Thornley, of the F. A. M. Competition Committee, advanced the opinion that steps should be taken to bring about certain improvements in track construction, primarily with a view of affording spectators greater protection, but he was frank in stating his belief that many of the reforms suggested are far-fetched and unreasonable. When his attention was called to the argument that board-track racing should be confined to 30.50 cubic inch machines he stated unhesitatingly that such a restriction would, in his opinion, doom the racing game as far as the saucers are concerned. He also expressed the belief that under conditions similar to those which obtained at Newark a 30.50 machine, tuned to racing pitch, would be capable of doing almost as much damage as one of the big twins now in use.

Referring to track improvements which would afford spectators more adequate protection Chairman Thornley stated that action along these lines should be taken at once.

"All board tracks are in the experimental stage," said the chairman, "and we must not be too drastic in our demands for changes,

but I believe the F. A. M. Board of Directors should and will specify improvements which will reduce to the minimum the danger of a racing machine striking persons who are seated in the bleachers or grandstand. This would not be an unreasonable demand to make of the track promoters. I hope the Board of Directors will demand that sanctioned board tracks have from three to four feet of perpendicular boarding immediately above the track incline, and that above that and to the top of the railing heavy wire netting shall be used. The railing referred to should be at least six feet above the floor of the first row of seats. This would seem to be the only certain method of preventing persons in the stands from hanging out over the railing. There will probably be a difference of opinion as to how high the railing should be, and this is a matter for the Board of Directors to settle definitely.

"The Newark accident was one to inspire horror, but the conditions were so unusual that they cannot be set up as a standard by which to gauge racing on all board tracks in the future. Racers know that they are taking risks, and take them willingly, but we must use our best efforts within reason to protect those who patronize the meets. Any reasonable step in this direction will have my support."

JUST WHAT HAPPENED AT NEWARK

NEWARK, N. J.—Racing men, officials and motorcyclists in general have threshed out all the details bearing on the accident at the Newark Motordrome on Sunday, September 8, which resulted fatally for Eddie Hasha, Johnnie Albright and six spectators, and it is the consensus of opinion that the little Texan fainted on his machine before it headed up the decline for its terrifying dash along the upper fence. Whether Hasha's weakness passed in time for him to realize his awful position before he suffered the crash which ended his life will never be known, but many eye-witnesses, physicians among them, lean to the belief that the rider was unconscious from the instant that his machine made its first wild swerve up the incline. Several racing men who were well acquainted with Hasha have suggested that he was temporarily stricken blind. Some time ago while attending a moving picture show Eddie alarmed his companion by exclaiming that he was unable to see. He recovered in a few moments on this occasion. In this connection it should be noted that the autopsy performed on the day following the accident showed Hasha's heart, brain and eyes to have been normal.

The accident came in the 4-mile free-for-all handicap, which was the last race, and incidentally race No. 13. Ray Seymour and Hasha started on scratch; Ray Peck and Johnnie Albright had a quarter of a lap, and Frank King and Johnnie King were each allowed half a lap. Hasha was leading at the gun with Seymour in his pace, followed by Peck, Albright, Frank King and Johnnie King, in the order named. On the third lap Hasha's machine developed a miss, which gave Seymour an opportunity to pass him. Dropping one hand Eddie adjusted something on his machine and at once he picked up speed and closed part of the gap which had been opened by Seymour. The next instant Hasha shot up the track at a sharp angle and struck the rail, above the "dead line." He rode this 2-inch railing for about 100 feet, crushed out the lives of four boys who had been watching him with their heads far out over the rail, and injured about ten others. His machine continued in this position until it struck a large post which threw the rider into the grandstand.

After striking the post Hasha's machine tore along the railing for a few more feet and then dropped down on the track directly in the path of Johnnie Albright, who was striving to get into the pace set by Peck. The wrecked machine struck Albright on the shoulder and the Denver rider went down with terrific force. Then, mixed up with the two machines, he slid along the track for about

The Scene of the Newark Tragedy.

240 feet. He was unconscious when picked up and it was quickly learned that he had sustained a fracture of the skull, a fractured leg, a dislocated shoulder and other injuries. Albright did not regain consciousness and died in a hospital five hours later. Peck was unhurt, as he passed Hasha's machine while it was still tearing along the upper railing. His escape, however, was a narrow one. Frank King and Johnnie King also managed to ride clear.

Widely varying stories, some of them quite fantastic, were told to account for Albright's fall, but the outline of the accident given above is true in every detail. The writer witnessed the entire affair and has verified every statement made, by consultation with track officials and the surviving contestants in the fatal race.

After Hasha's machine struck the pole which threw the little Texan the rear wheel was ripped out and thrown high in the air. It fell in the infield and injured a spectator so severely that he died several days after the accident. In addition, one of the injured spectators in the bleachers also succumbed, these two with the four boys who were killed instantly and the two racers, bringing the gruesome total up to eight.

Hasha had finished a semi-match race with Seymour just prior to the start of the handicap, and when the judges called the race a dead heat the Texan protested vehemently. When he was about to start in the fatal handicap he turned to an official and said: "Watch me this time; there won't be another dead heat." The little speedster was excited as he got under way, and it is taken for granted that this excitement, combined with weakness resulting from an illness of the previous two weeks, brought on the collapse which left him unable to guide his machine. Hasha's body fell in the grandstand close to the seat which had been occupied only a few minutes previously by Mrs. Hasha. She is supposed

to have been in the infield when the accident occurred.

Immediately following the accident the track was placed under police surveillance, and on the following day police officials and the prosecutor made a careful examination of the scene. On September 17 the Grand Jury was charged to bring in an indictment of manslaughter, if after visiting the track it was decided that the management had been at all negligent in its arrangements for the protection of spectators. It was generally admitted, however, that the track officials should be held technically blameless, as the Newark bowl has from the start embodied several precautionary features not found on other board tracks throughout the country.

GRAND JURY PROBE.

Jurors Visit Scene of Vailsburg Accident.

NEWARK, N. J., September 17.—Judges Adams, Martin, Osborne and Dungan sat beside Chief Justice Gummere in the Supreme Court today when he charged the Grand Jury in regard to the recent disaster at the Vailsburg Motordrome. In opening Justice Gummere said he wanted to say a few words in relation to the disaster in which eight lives were sacrificed, and to point out possible criminality on the part of the management of the track.

Justice Gummere then pointed out that while a highly dangerous sport was being conducted it did not follow that the persons conducting it were criminally responsible for the loss of life. They were responsible to the riders to use care so far as it could be provided for their safety. The fact that the track may not have been constructed according to the best ideas would not warrant an indictment unless it was shown that it was constructed in a careless manner and with criminal negligence.

He further stated that the management was under obligation to the spectators to supply them with safe places whence to observe the races. The question was, Did they do that? He described the construction of the track as he had seen it after the accident and said that those of the spectators who met death were all in the front row.

"We now know," he said, "that the front row was dangerous, but in charging on criminal responsibility I must take the conditions as they were when the seats were placed there. Was there at that time any reasonable man who would have said that those seats were dangerous?"

He suggested that the jurors visit the motordrome and see the exact conditions as they were then.

THE NEW DAYTON

Seven and Nine Horsepower Models with or without Two-Speeds Listed by Davis Company.

FOUR types of the new Dayton motorcycle, manufactured by the Davis Sewing Machine Company of Dayton, Ohio, will be ready for the market within a few weeks, according to late bulletins from the factory. The Davis company will produce 7 and 9 h. models, with 2-speed device, and types of the same horsepower minus the two-speed equipment. The 7 h. model without two-speed will be listed at \$265; the 9 h. machine minus two-speed will sell at \$275; the two-speeded 7 lists at \$315, and the 9 with same equipment at \$325.

In the next issue of MOTORCYCLE ILLUSTRATED the new Dayton machines will be illustrated and fully described. The general specifications are given as follows: Motor, Spacke, 7 or 9 h., twin; carbureter, Schebler; ignition, Bosch magneto; muffler, Dayton; lubrication, gravity feed; control, double grip; transmission, chain drive with free engine clutch; tank, gasoline capacity 2½ gals.; oil capacity, 2 qts.; fork, Dayton spring fork; wheels, 28 inches; tires, United States, Continental or Goodyear 3-inch; brake, Lester "dead center" coaster brake; stand, folding type; saddle, Troxel or Persons; tool box, large metal type; front chain adjustment, ⅝ inch; clutch, Eclipse free engine. The company is preparing for heavy sales.

ON HENDEE ROAD STAFF.

WILLIAM REICHERT, formerly connected with the Chicago branch of the Hendee Manufacturing Company, and for the last year manager of the retail sales of the Wisconsin Motorcycle Company, of Milwaukee, is now on the traveling staff of the Hendee company, covering a western district.

"ROUND-THE-WORLD" TRIP.

THE accompanying photograph shows Mr. and Mrs. Humphries, the "round-the-world" Minneapolis tourists, ready for the start of their long grind. It will be noted that they have a trailer of novel design, this being necessary because of the fact that they carry a full camping outfit for emergency stops along the road at night.

DETURCK'S LONG TRIP.

HARRY J. DETURCK, of Los Angeles, Cal., who has been visiting in the East for some time, is now headed for Los Angeles on his motorcycle. From New York he went to Springfield, Mass., where his machine received a complete overhauling. The next move was to Boston. Following is an outline of the route pursued: From Boston to Buffalo and thence by lake route to Columbus, Ohio; from Columbus via the Old National Road to St. Louis, through Missouri, Kansas, Oklahoma, Texas, New Mexico, Arizona and into Southern California. The trip is entirely for pleasure and no effort will be made to establish any record, five weeks being allowed for the trip. Deturck rides a twin Indian.

MELVIN MEYERS and Chris Wagner, of Buffalo, rode a motorcycle, with sidecar, on a recent tour to New York and Chicago.

HENDEE BRANCH IN ATLANTA.

IN recognition of the rapid boom of the motorcycle in the Southern States, together with the widespread popularity of the Indian, the Hendee Manufacturing Company, of Springfield, Mass., announces that it will establish a factory branch and service depot at Atlanta, Ga., to enable the rapidly increasing business of that section to be handled more promptly and to save the delays in distributing machines and supplies from the factory.

As no suitable building was available, arrangements were completed for the erection of a new building especially designed and adapted to the requirements, on Peachtree street near Merritt avenue, consisting of two stories and basement, 125 feet by 26 feet, which will be ready for occupancy on December 1. Temporary quarters from October 10 until permanent quarters have been completed, have been arranged for and will be located at 157 Peachtree street.

GOOD WORK IN CANADA.

THE roads and highways of Southern Ontario have become a great stamping ground for motoring tourists, both on two and four-wheels this summer, and the demand for posted routes has caused several organizations and corporations to go to the trouble of "blazing" the more popular highways. The Ontario Motor League, with the aid of the motorcyclists of Toronto, has been placing signs on main roads, while the Indian Refining Co., of New York, recently sent out a car to secure data on the roads of Ontario and Quebec for use in their Havoline tour book of 1913. The B. F. Goodrich Co. is placing trail blazers on the Ontario routes and their familiar metal signs will soon be seen.

For the benefit of international tourists the Niagara Frontier Club has erected large signs at the border points along the Niagara River warning the motorists of conditions and regulations.

The CYCLECAR

Why the Cycle-Car Came into Existence in England—Leading British Types—Their Chief Characteristics Briefly Stated—Future Possibilities of the Light, Speedy Outfits.

First Cousin to the MOTORCYCLE

‘ BRITISHER ’

I'M going to devote my space in this issue to a new design of near-motorcycle which is booming some on the British market. It owes its genesis to the demand for a soundly built and planned motor capable of conveying two people with the speed and comfort of a full-size automobile, and at little greater expense than a motorcyclist is accustomed to disburse. To understand the position one must review the past history of passenger motorcycles, which is as follows:

1900-1903. The quadricycle, consisting of a two-wheeled forecarriage attached by long sidestays to the rear half of the ancient De Dion and similar tricycles. Killed by want of power (engines ranged from $1\frac{1}{4}$ to $2\frac{3}{4}$), general unreliability and high cost (\$600 and upwards).

1902-1906. The trailer; basket chair, hung on two-wheeled axle, slung behind a motorcycle by a long rod. Killed by unsociability, inherent dangers and dusty position of the girl.

1906. Tricars. Three-wheeled chassis, with chair over two wheels in front. Prematurely born. Inefficient springing, unreliable engines and ignition, tendency to upset or become unsteerable when back tire deflated. Would stand a fighting chance today, now that engines and ignition are perfected; indeed many three-

wheeled 1912 cyclecars are only 1906 tricars reborn in a *fin de siècle* shape.

1908-1912. Sidecars. Cheap; machine easily convertible back to solo mount. Require little power to pull them. Sociable; comfortable.

Why are we not content with the sidecar? Any man who owns a motorcycle with a variable gear and an engine of at least $3\frac{1}{2}$ h. can add a sidecar for a small sum, and he immediately secures a passenger-carrying vehicle with the advantages detailed above.

Sidecar Characteristics.

That the sidecar has a few drawbacks not even its most enthusiastic advocate will deny, but it is only fair to say that for the full-fledged roadster they are not very serious ones. To begin with, the lady must regard herself not only as a passenger, but as ballast. She must lean out round all corners and be prepared to do considerable shifting over rough going and on long jaunts. Few passengers, however, seem to object to a certain amount of this additional exercise. Then the luggage carrying capacity is small, although some makers are fitting a sort of rack in the rear on which a bag or suitcase may be strapped.

Even with fairly good springing on up-to-date sidecars it must be admitted that there is

room for improvement in this direction. Another point is that the width of the outfit occasions the maximum of wind resistance. Again, the single wheel has to stand heavy driving and braking strains and its tire is not remarkably accessible. While these and a few other minor disadvantages may not deter the average motorcyclist it is a fact that quite a number of sidecarists are in a mood to try out something new in the hope that it will give all the exhilaration and general enjoyment of sidecarrying with none of its drawbacks. Whether this can be done is the question engaging the attention of several leading English designers.

Introducing the Cyclecar.

In fairness to the sidecar it should be stated that over 20,000 of these attachments were in use on English roads last year, and that there is not likely to be any falling off in the demand for them. It is safe to say that for the great rank and file their popularity will continue to grow. However, the disadvantages referred to above have inspired upwards of 100 inventors to coquet with the idea of producing the perfect passenger motorcycle, and a weird crop of three and four-wheeled cyclecars is the natural outcome. When I say there is a "boom" in cyclecars, I do not mean that the

No. 1—The "Mighty Atom."

No. 2—The Morgan.

boom has settled down into a healthy commercial matter of supply and demand along fixed lines. I imply rather that many a young spark who has a sweet girl to drag about with him and knows where to raise \$500 is talking cyclecars, and that 100 factories are busy trying to cater for him. At least four of our biggest motorcycle factories have cyclecars on the stocks for the 1913 market, viz., the Clyno, Rudge, Humber, and Premier firms, and half a dozen patterns are already selling in fair quantities, though our national wariness makes many enthusiasts prefer to "wait and see."

Drawbacks of the Cyclecar.

I may next indicate the difficulties which hamper the designer of a cyclecar.

1. Price. We can buy a 6 h. full specification automobile, of really magnificent workmanship, for \$600, with first class coach-built body, hood and screen; or we can buy a four-seated Ford car complete and ready for the road for \$720. Secondhand samples of these automobiles in very fair condition are obtainable for \$500. The inventor must, therefore, sell his cyclecar new at not more than \$500, and he must offer for that outlay some attractions which a secondhand automobile cannot claim, e. g., cheaper upkeep, greater speed, or the like.

2. Comfort. It's easy to get the pace, and not difficult to get the low upkeep, but to make a vehicle scaling 600 pounds or so sit down flat on rough roads at 45 miles per hour is less simple. Moreover, there are no engines made which are suited for the job. You can get plenty of 8 h. V aircooled twins, but they are made for motorbikes; they have small flywheels, and they will not run slowly. When a cyclecar is standing at the gate, neither you nor the neighbors want its engine to buzz round noisily at 1,000 revolutions. At the same time great power is needed for the speed, and low weight is essential to the basic idea. Therefore you want a new type of engine, which can tick over at 100 revolutions per minute when the cyclecar is standing, and burble round at 3,000 to give speed on the level and power up a hill. If it can't burble round it will be heavy, and its heavy, slow impulses will demand a stiff and weighty frame. Good springs and cosy bodywork are necessary and must be obtained without piling on weight.

3. Light and simple transmission. By the time you have machined out a three-speed gearbox and differential axle and purchased 20 feet of chain, you may have a big hole in the \$500 catalog price. Belt drive seems indicated, but with belt drive a really low emergency ratio is awkward to devise, and when you start thinking of variable pulleys you butt up against a heap of patent legislation.

Some Specifications.

The accompanying pictures and summarized specifications give some notion of the lines on which successful designers are tackling the very complex problem.

The "Mighty Atom."

No. 1. The "A. C." Tricar or "Mighty Atom." This car is distinguished from the others by a long period of public service, during which it has acquired a high reputation and performed creditably in many competitions. As the cut shows, it is a glorified tricar of good workmanship and original design. It is well sprung, has an accessible back wheel, and is driven by a powerful single cylinder fancooled motor set amidships. The engine has a good range of speed and tugs like a

drayhorse; it is very steady running, having a huge external flywheel on both sides of the crankcase, fans being frictionally driven off the rims of both flywheels. The transmission consists of a single large chain driving a huge epicyclic hub in the rear wheel. The steering is by side tiller. This machine bristles with minor ingenuities, and is sincerely original from stem to stern. It has no defects which are separable from the limitations of its design, and can claim hundreds of satisfied users. It is used as a light delivery car by the Post Office and by many private trading concerns.

No. 2 is the Morgan Runabout—abviously just a glorified tricar; 8 h. V aircooled engine, 85 m. m. x 85 m. m. cooled through gauze front of bonnet. Leather cone clutch; propeller shaft drive to crown and bevel on countershaft, on which two sliding dog clutches couple up two separate chain and sprocket drives to the rear wheel. A successful machine in competition for two years past. Cost, \$425. Main

unless care is taken at corners, gear ratios limited by design of pulleys, naked belts, requiring periodic attention. Not much weight on rear wheels (this would only be a drawback on steep hills when greasy).

A Unique French Model.

No. 4. Bedelie (French). Cost ranges from \$280-\$600, according to engine fitted, which may be either a 3½ h. single, or an 8-10 h. twin. Narrow tandem type of chassis (many remarks above apply here). Ash frame, armored with fitchplates at angles. Three-point springing. Chain drive to countershaft, thence by twin belts, which dispense with need of differential. Free engine obtained by slackening belts. Cable and reel steering (not duplicated for safety, as on the Rollo). Variable pulleys, with only two ratio position locks. Main merits: excessive lightness (from 2½-3 cwt. according to engine power); this cuts both ways, making for speed and climbing, but reducing strength and com-

No. 3. The 8 h. "Rollo" Car—Brooklands Model.

merits: good workmanship, good springing, clever details (e. g., back rest is merely broad leather strap between two uprights, just as cosy as padded leather chair; gear lever is just a stub steel arm sticking out of gearbox on frame level, convenient to driver's right arm when hanging naturally over side of body). Main defects: high-speed engine, some difficulty in steering when back tire deflates, single driving wheel not tremendously accessible for tire repairs.

The Narrow Rollo.

No. 3. The Rollo four-wheeler. Cost, \$475. Practically unknown in competitions at present. Narrow tubular frame, designed for tandem seating (cut shows special racing body). Engine, 8 h. V aircooled twin, set behind gauze screen in front. Three-point springing—central spiral in front, two semi-elliptical laminated behind. Fan-assisted cooling. Chain from engine to countershaft amidships. Countershaft ends in two patented variable pulleys, whence twin lin. belts transmit drive to rear wheels. Main merits: good springing, very low weight—a man and a girl, one at each end, can lift machine easily. Tandem seating reduces wind resistance to a minimum. Simple construction throughout. Main defects: high-speed engine, bounceable at speed, easily upset

fort; specially designed engines (cylinders of twins set at 90 degrees). Main defects: notions on chassis are French, which do not quite accord with British; they are marked by lightness and ingenuity rather than by convention and staunchness. No great range in gear ratios (this is compensated for in part by very light weight, the vehicle clinging to top gear on all ordinary roads.) Narrow track reduces wind resistance, but does not fit cart ruts, nor afford great steadiness.

The Recently Arrived Carette.

No. 5. "C. M. C." Carette. I show a cut giving more insight into working parts of this vehicle, which has at present no public reputation, having recently made its debut. It is obviously a glorified tricar, with a particularly accessible back wheel. It sells at \$550, and its main success will depend partly on workmanship and partly on the extent to which the four-wheeled types make good.

Summing Up.

My own experience with cyclecars would suggest the following prophecies about the ultimate surviving type. It will probably be a four-wheeler, since in that design cheap tires are usable, tires are accessible, balance is better than with three wheels, and the tracks are

No. 4. The Bedelie.

No. 6. The Autotrix Tri-Car.

better suited to roads scarred by horsehoofs down the centre.

It will have an air-cooled engine; it is easy to make an air-cooled engine which will keep cool on a light and speedy chassis, so that there is no justification for the expense, weight and complications of radiators, piping, and pumps. The engine will therefore be set at the front. The engine will probably follow a separate line of design. Existing motorcycle engines do not run slowly enough; existing car engines do not run fast enough. A big twin, set at 90 degrees, with two heavy outside flywheels and low compression ratios seems to be indicated.

It will be better sprung than any existing patterns. The transmission is likely to be by chain, countershaft, and twin belts. The chain—or other primary rigid unit—is necessary to give a gear reduction too low to be obtainable by pulleys; but the final twin belt drive, is in-

No. 5. C. M. C. Carrette.

evitable unless an expensive axle is to be incorporated. Twin belts slip just enough to allow the inside wheel to overrun round corners without producing a skid. Possibly a fixed ratio sliding gear may be preferred on many models, in which case side belts with

large countershaft pulleys would be retained, as a substitute for a differential axle. The body work will be very simple, to keep down weight and cost. A cross behind a deckchair and a hammock is likely to be evolved out of strong webbing and broad leather straps, depending from metal stretchers and hangers.

On some such lines as I indicate it is probable that light, four-wheeled 8 h. cyclecars selling at about \$500, will probably become standardized within a year or two. If the boom dies an early death, its decrease will be due to the folly of designers who make their specification too luxurious, and include three-speed sliding gears, with reverse, differential axle, coach-built bodies, etc., so butting up against the lesser automobiles, new and second-hand, and thereby automatically limiting the number of their sales, and the size of their outputs.

WHAT'S THE ANSWER?

THREE motorcyclists, charged with riding twenty miles an hour along the Ocean Parkway, in Brooklyn, N. Y., recently were fined \$10 each by Magistrate Nash in the Coney Island court, while three automobilists, charged with going from 28 to 35 miles an hour, got off by paying \$3 each. Naturally, the motorcyclists are in an unpleasant frame of mind. They want to know why the automobile owners were favored with three-dollar fines when the testimony showed them to be even more flagrant violators of the ordinance than the pilots of the single-trackers.

MUST HAVE LICENSE.

A LAW requiring all motorcyclists to carry a State license number went into effect September 9 in Kansas City, Mo., and will be rigidly enforced.

BACK FROM EUROPE.

FOUR New Englanders recently completed a 2,000-mile motorcycle tour through Europe. The tourists were L. M. Foss, Lynn, Mass.; J. C. Coughlin, Augusta, Me.; B. F. Crowley, Danvers, Mass., and J. M. Young, of Montrose, Mass. Young motored through England and France only, and was rejoined by the others on their return from Vienna.

FINE KANSAS ROAD.

MOTORCYCLISTS of Southern Kansas are elated over the completion of a good road from Independence, Kan., to Arkansas City, Kan., across the counties of Montgomery, Chautauqua and Crowley. The road is known as the "Oil Men's Road," and is ideal for motorists. Riders of the two-wheeler can make any time up to thirty miles

per hour over any part of the road. Some of the hills are very steep and tax a motor to pull them, but the rider can rush them almost any time, which makes the strain about fifty per cent. less. The road was put through as a kind of experiment, and has proven so popular that other roads are now being planned.

Fred and Hendon Vann, of Birmingham, Ala., recently made a trip to Washington, D. C., and return.

MOTORCYCLE MEMORIES & SOME WARNING TIPS

BY GEORGE M. JOHNSON

EVERY motorcycle rider has a fund of reminiscences at his disposal, and doubtless a few of them are more or less painful in nature. Some bring to mind occasions when the rider has played the part of an all-around bonehead—occasions which he blushes to remember—such as the time when he spent ten minutes pedaling his head off before a galaxy of admiring friends in a vain effort to make that new boat chug-chug for them, only to discover, after listening to fifty-seven varieties of suggestions, that he had neglected to turn on the gas.

Some of these fond memories, however, may not be due to a temporarily ossified condition of the rider's brain; they may be simply hard luck records, such as bumping over a broken beer bottle after dark, with disastrous results to a new tire; or running out of gas far from home. And losing things on the road! My losses have been painfully numerous. I started forth on one tour with an extra supply of both gas and oil firmly (?) strapped to the luggage carrier. After riding fifteen miles I happened to glance back at said carrier; it was still there, but the spare cans of gas and oil were gone.

A Tool-Box Experience.

It is heartbreaking to observe how tools get away. I had a peculiar experience along this line during my first riding season, and that was four years ago. I had taken a trip of about twenty-five miles outside of town to visit some friends, nothing of importance happening on the way out save an exciting brush with an automobile. Needless to say, I easily left the four-wheeler in the rear. When I reached my destination, I was quite grieved to see that my tool-box was missing; it had come loose from its moorings somewhere on the road, and there was little use to go back and look for it, as I had no idea where the loss had occurred, and the road was so constantly traveled that some one would be sure to pick it up in a short time. I made a few appropriate remarks, and then sat down in an easy chair to rest and compose my shattered feelings.

Presently I noticed that an auto had stopped in front of the house, the very car I had raced against. The occupants were looking at my motorcycle, which was on its stand in the yard. I went out, and was decidedly gratified to learn that they had picked up my tool-box, which had left me about the time I left them. When it struck the ground, under the impulse of a forty-five miles per hour speed, it had burst open, scattering the contents in all directions, but those kindhearted people

had recovered practically everything. Not many automobile parties, I venture to say, would have been so considerate.

A Thoroughgoing Thief.

Another tool-box adventure of mine did not come out so well. I had been visiting a friend in the city one evening, going around to his home via machine. After an hour's call I went out to the motorcycle for my return trip, but as I turned on the gas in my Presto tank, I made a truly startling discovery.

"What's the matter?" exclaimed my host, who had come out to witness the departure.

I explained what the matter was in very vivid language. Some town "mucker" had gone through my tool-box and extracted everything there save my license and a spare spark plug. I have no idea why he left those articles, and suppose I should have been grateful for that slight favor, but I was not. My losses summed up as follows: Monkey wrench—50 cents; pliers—50 cents; two special wrenches at 30 cents each and one at 25 cents—85 cents; tire repair outfit—50 cents; screw-driver—25 cents. Total loss—\$2.90. The moral of this little episode is easy to see. Have a lock on your tool-box. I did so on the outfit of new tools, but that is considerably like locking the stable door after the old plug has been taken; it is much better to put the lock on *before*. It is a mighty mean person who will go through a tool-box in that way. Most of the things there would be practically useless except to the rider of a motorcycle, but as some of us have discovered, there are altogether too many mean people in the world.

That was not the only time objects have been lifted from my motorcycle. I once had a dollar watch fastened to the handlebars, as a convenience when on the road. The scheme did not work very well, for the watch soon began to run irregularly. I suppose it was not built to stand the strain of jolting over rough roads at thirty miles an hour. The watch was so worthless that I wound it less than half the time, and finally I ceased to wind it entirely, for one night when my fiery steed was waiting for me outside the city library building, a mucker collected the indicator. He doubtless thought he was making a rich haul. I only hope that he tried to go to work by that watch next morning, and lost his job for being late.

How a Gun-Case Disappeared.

In the open season I often go hunting via motorcycle, putting my "take-down" shotgun into its case, which is then thrust into the roomy rear game-pocket of my shooting coat. I formed the habit of leaving my machine in

any convenient place, having almost a child-like faith in the honesty of my fellow men, and also relying on the fact that in those unfrequented regions people were not likely to pass by so very often.

One day last fall I made a run out to a small lake up in the country after ducks. The ducks did not materialize to any alarming extent, however, and then I decided to take a chance at rabbits in a good place a mile or so from the pond. I left the main road, riding my machine along a little path that led across a brook, and there leaned the motorcycle against a tree until I should return, the gun-case resting across the saddle. I was gone not much more than half an hour, and on my return found that some miserable wretch had absconded with my gun-case. The strongest adjectives I could call to my aid—and some of them were pretty strong—did not bring back the missing article.

Locating the Moral.

These reminiscences bring home the fact, regrettable though it is, that the world has a fair sprinkling of people who have absolutely no respect for the property of others. Whether you as a motorcycle rider have suffered in this way or not, there is in the foregoing incidents an important lesson. Never leave any attachments on your machine that can easily be removed. Have a lock on your tool-box, and keep it fastened. Never leave gloves or leggins on the machine; take them into the house with you. If you have a watch on the handlebars, be sure that the clip or attachment which holds it is one that requires some effort to dislodge, and if you plan to leave the machine unprotected for a considerable length of time, it is better to take the watch off yourself, unless you prefer to risk losing it. Whether in the city or country, your possessions are never safe, and to leave a motorcycle in such a place that some light-fingered individual has access to it, is to go looking for trouble.

Machine Lock Is Needed.

And there is one thing more. You all have seen ads. in the trade journals such as this: "STOLEN—1911 Model of Blank motorcycle; color, red; engine number, so-and-so. Reward for information leading to its return." Motorcycles are becoming so common now that we can expect these robberies to become more and more frequent, and goodness knows they are frequent enough already. A good many persons are getting familiar with the management and control of the leading models—persons who would be perfectly willing to steal a motorcycle if they had the chance.

Everyone knows in what a systematic way bicycle thieving has been carried on.

If you leave your motorcycle unprotected longer than a very few minutes, the only safe thing to do is to lock it; not merely lock it so that the engine cannot be run—a thief could easily push the machine away into a safe place, there to deal with the matter at his leisure—but to lock it so that either the front or rear wheel cannot be turned. No person is likely to carry away a motorcycle. A good husky chain and husky padlock may be a combination decidedly awkward to carry in an already overcrowded tool-box, but it is far better to take that trouble than to lose a two hundred or two hundred and fifty dollar machine. This is the only sure way to avoid the most painful motorcycle memory that one could have—the memory of a new 1912 twin that was stolen before its happy owner had ridden it a thousand miles.

NEW YORK TO PHILADELPHIA.

HARRY H. J.—From Broadway and Fulton street go down Greenwich to Cortlandt street, where turn west and take ferry to Jersey City (Penna. R. R.). At ferry go out York street to city hall, then turn into Mercer street, on which run to Hudson County boulevard. Go north on boulevard to Turnpike and follow Turnpike to Newark, Broad and River streets. Go on toward library and turn left into Washington street on which continue to intersection with Clinton avenue. Turn from Clinton avenue to Elizabeth road (trolleys) and follow into Elizabeth along North Broad street. At Westfield avenue, Elizabeth, go to right and follow out to Cranford, Garwood, Westfield, Fanwood and Plainfield. From 5th street and Park avenue, that city, turn right on Park avenue going under railroad at Plainfield Station. Follow trolley through Dunellen; go on and pass Bound Brook (8.1 miles from Plainfield). Go into Bound Brook and enter New Brunswick (7.5 miles on).

From New Brunswick go 9.5 miles to Dayton, then Hightstown, Windsor, Edinburg and Trenton (latter city is 32.2 miles from New Brunswick). From Trenton, State and Broad streets, go to Philadelphia via Langhorne, La Trappe, Bustelton, and Ogontz. Distance, 35 miles. Get a New Jersey license for this trip.

NINTH TRIANGLE RUN.

OCTOBER 6 is the date set for the ninth annual Triangle Run of the Providence (R. I.) motorcycle club, always considered one of the banner runs of the year for New England. The start will be made from Providence at 7 a. m. The riders will leave Boston at 10 a. m. and Worcester at 1 p. m., arriving back in Providence at 4 p. m.

The entry fee is \$2. Applications may be forwarded to B. A. Swenson, at Providence. Mr. Swenson has guaranteed free storage for motorcycles and side-cars to the number of three hundred for out-of-town entrants, and free sleeping accommodations are being arranged for a limited number. Medals will be awarded to all who finish the run.

ON BUSINESS TRIP.

JAMES C. DEVITT and Clifford Macbeth, of St. Paul, Minn., are riding motorcycles on a business trip from St. Paul to Chicago and Milwaukee. At Chicago they will be joined by Thomas and Homer Milton, of St. Paul, who are returning from a motorcycle trip to New York.

ON 3,000 MILE TOUR

Mr. and Mrs. Moody Experienced No Machine Trouble on Tandem Trip from Minnesota.

MR. AND MRS. E. S. MOODY, of Glencoe, Minn., recently completed a long tandem motorcycle tour. The general route taken was from Glencoe to Buffalo, N. Y., with allowances for many side trips. The distance covered was 3,718 miles, 3,071 of which was on an Emblem motorcycle and the remainder in an automobile.

They left Glencoe June 28, going to La Crosse, and then via Madison and Milwaukee, Wis., to Wilmette, a suburb of Chicago. They arrived there July 15. Sand and steep hills, together with bad weather, made progress slow through Wisconsin.

A few days' rest was taken by the tourists, and they then went in an automobile accompanied by Mrs. Moody's mother and sister to Fremont, Mich., and visited Mr. Moody's brother, whom he had not seen for 12 years. They returned to Chicago, and after a short visit left again for the East on their motorcycle on July 26, going by the way of South Bend to Toledo. From Toledo they went via Cleveland, Ohio, and Erie, Penn., to Buffalo, N. Y., reaching the latter place on July 31. They went to Niagara Falls and viewed the American and Canadian falls, and also went to Angola, home of the Emblem motorcycle. Mr. Moody is the Glencoe agent of this company, and he and his wife were royally entertained by officers of that company during their sojourn in Angola. They started on their return trip on August 4 and reached Chicago on August 7. They left the windy city following a four days' rain which made the roads heavy and slippery and traveled via Clinton and Cedar Rapids to Waterloo, Ia., and then proceeded to Minnesota Lake, arriving there on August 16. Mr. Moody went on to Glencoe on August 23, while his wife remained to make a more extended stay with her parents.

Mr. Moody says the roads east of Chicago were very good, being mostly macadam. He was fortunate in not having any trouble with his machine during the entire distance, except for one puncture.

DRACHMAN'S HARD TRIP.

LEO H. DRACHMAN, of Perham, Minn., who recently completed a motorcycle trip from Chicago to Buffalo and back, tells of bad weather and rough roads encountered.

He rode from Chicago to Maria Stein and St. Henry, Mercer County, Ohio, and after a ten days' stop struck out for Buffalo. On account of excessive rain he only got as far as Newton, a small town 24 miles east of Cleveland. He then went from Cleveland to Buffalo by boat. From Buffalo he took a spin to Niagara Falls. The return trip was very hard on account of rain. He rode 100 miles on low gear, and remarks: "You can imagine what kind of roads I had, when it was necessary to do that."

ABERDEEN TO MINNEAPOLIS.

A. J. EDDY, F. J. Parsch and G. E. Petrick, motorcyclists of Aberdeen, S. D., recently completed a trip from Aberdeen to Minneapolis. The distance covered was about 1,000 miles and the riders made it in four days.

The start was made from Aberdeen at 5 a. m. and the riders reached Minneapolis at 7 p. m. the next day. Except for a bad stretch of 80 miles they found good roads. The return trip was started at 9 a. m. the next morning and after two days' traveling they reached home at 7 p. m. They averaged over 200 miles a day.

ON SOUTHERN TRIP.

HOWARD R. COOK, 18 years of age, recently reached Indianapolis on a motorcycle trip from Cedar Rapids, Iowa, to Atlanta, Ga. He is riding a Flying Merkel. Cook visited Keokuk, Iowa, Springfield, Ill., Danville, Ill., and other towns en route. He had traveled five days and had experienced no trouble except with his rear tire.

J. J. REID, of San Diego, Cal., riding a Thor IV, has just completed a 3,500 mile trip along the coast. His expenditure, for supplies was only \$15.

A. W. and A. L. Leppard, ranchmen of Burden, Kansas, do all their traveling on motorcycles, and the latter is now en route on a trip to Texas.

Three Pope Riders of Rio de Janiero, Brazil.

A MEET IN MANSFIELD.

MOTORCYCLE races were featured at the fair held in Mansfield, Ohio, on September 4. The five-mile amateur race was run in 7:25½, Evans being first, Ticknor second, and J. Hill, third.

In the ten-mile amateur race Marshall won first, Evans second, and Ticknor third. Time, 16:41.

In the five-mile trade riders' race C. F. Williams won first, R. Gardner second and W. Thuma third. Time, 7:10½.

In the ten-mile trade riders' event C. F. Williams won first, R. Gardner second, W. Thuma third. Time, 15:54.

In the pursuit, free-for-all, C. F. Williams took the race. In the last event, the 25-mile free-for-all, C. F. Williams came in first, A. O. Lemon second and C. Ticknor third. Time, 38:10¾.

FLANDERS SET THE PACE.

AGAINST a field of single and two-cylinder machines, the Flanders "4" captured first and second prizes in all events at the New Haven (Mich.) home-coming week motorcycle races. While this meet was an unsanctioned affair, the results of the races show that while the Flanders folks never claim to be producing a racing machine, it can "travel some."

The Flanders Company does not expect at present to enter a racing team in speed events, preferring to leave contests of this kind to individual riders, who, of course, must use stock machines, as the Flanders Company has not as yet built any machines for racing purposes.

RIDERS DISAPPOINTED.

ANNOUNCEMENT was made recently that an aero exhibition company would hold a combined aviation and motorcycle meet at the Brunots Island track in Pittsburgh, Pa., and a number of Pittsburgh riders turned up their machines and went to the course prepared to compete. Rain interfered with the program, and when the track was finally in condition for riding it developed that the management could not produce an F. A. M. sanction for the races. The boys refused to ride, and feel that they were bilked. They are doubly peeved because of the fact that the Brunots Island track is not easily accessible.

RACING AT WILLIAMSPORT.

ARACE meet held recently under the management of W. A. Myers, Indian agent in Williamsport, Pa., brought out a good crowd of fans, and afforded several interesting finishes. In the 5-mile open event Roth (Indian), took first place; Pineau (Indian), was second, and Bostley (Indian), third. Time, 6:22. In the 10-mile open race the same riders finished as in the 5-mile event. Time, 12:48.

GODFREY'S FINE SHOWING.

IN the recent Circuit de Fontainebleau, held in France on August 25, Oliver C. Godfrey, best known as the winner of the 1911 Senior Tourist Trophy on the Isle of Man, finished first on his Indian twin in competition with French and other English cracks. Godfrey covered the distance of 279 miles in 6:34:59, over varying conditions of road surface. His machine was fitted with Coventry chains on both drives.

OKLAHOMA CITY MEET

Feature of Big Program Was 113-Mile Road Race in Which McMichael Led the Field.

MOTORCYCLING is viewed with much more interest and enthusiasm than heretofore in Oklahoma City, as a result of a successful race meet recently held in that city. The course was around the grand boulevard, which circles the city and covers a distance of 28½ miles. The contestants were all members of the Oklahoma City motorcycle club.

Considering the dry, dusty and sandy condition of the road, the time made is considered very good. The fastest laps were; twins—M. M. Murray, Harley-Davidson, 32:45; singles—McGranahan, Indian, 35:45. The feature race covered a distance of 113 miles, and was won by Jess McMichael, twin Harley-Davidson, his time being 2:28:45½. The following riders finished in the order named: M. M. Murray, twin Harley-Davidson; McGranahan, single Indian; Churchill, twin Indian; Renhardt, single Indian; and Stedden, single Harley-Davidson. Plans are now being laid for a meet next spring, and an effort will be made to obtain some of the best riders in the west to compete.

COLUMBUS ENDURANCE RUN.

COLUMBUS, O.—The reliability run planned by the Columbus Motorcycle Club for this month will cover a course of 90 miles. The route will probably lead through Linden Heights, Westerville, Sunbury and Worthington, with several secret controls en route. William Wells, chairman of the run committee, states that the event will be pulled off within two weeks and that practically the entire club membership will participate. A number of the local amateurs are planning to enter the race meet to be run at Powell, Ohio.

CASE IN A SPILL.

FLOYD CASE, while riding a twin-cylinder stock Excelsior machine in an exhibition five mile race against time at Coffeyville, Kan., recently, was thrown and painfully in-

Floyd Case, Coffeyville, Kan.

jured, the result of his mount skidding. The dust on the track was almost three inches deep on the stretches and deeper on the "corners." In spite of this handicap, Case rode three miles in three minutes and twenty seconds.

BAKER IN RECORD TRIAL.

COLUMBUS, O.—Close and exciting finishes characterized the Labor Day race meet at the local motordrome. Hare, Woolley, Yates and Birkenbach, furnished the chief thrills and tied for the honors. F. G. Baker, the Indianapolis rider, endeavored to shatter the world's 300-mile record during the morning, but was compelled to give up his trial in the 145th mile because of a broken cross head pin. Baker covered the 145 miles in record-breaking time, being clocked at 129 minutes.

A FATAL SPILL.

CLEVELAND OLIVER, of St. Louis, Mo., 26 years of age, sustained fatal injuries in the first event held at the St. Louis Motordrome recently. Oliver was riding at the rate of 65 miles an hour when he lost control of his machine and was thrown 40 feet into the air. The accident was due primarily to his inexperience, he having ridden only one month prior to the meet.

WESTMORELAND RACES.

WESTMORELAND COUNTY motorcyclists held a race meet in connection with the annual fair at Youngwood, Pa., Thursday and Friday, September 12 and 13. On the first day, 10 and 15-mile races were carded. For the second day, five mile and 25-mile races were on the program.

OKLAHOMA CITY BOWL.

CAPITAL has been subscribed and plans laid for a saucer track in Oklahoma City, Okla. E. C. Clark, who is behind the movement, believes that Oklahoma City is so located as to make motorcycle racing a success during the winter season.

CLOSING PROGRAMS.

THE races scheduled for Labor Day at the Riverview Motordrome, Chicago, were postponed until September 7 and 8 on account of the wet track. These races closed the Riverview season and the riders are on their way to California to participate in the coast meets during the winter.

SCOTHORN INJURED.

FRED SCOTHORN, secretary of the Coffeyville (Kan.) Motorcycle Club, while riding his two-wheeler on the race track, and watching Ora Clossen, a racer, do a fast mile, collided with the outside fence and crushed his right foot.

BENNETT GOING TO THE COAST.

WELLS BENNETT, of Wichita, Kansas, who has carried off the honors in many events held in Wichita and neighboring towns, has been booked to take part in the races in Los Angeles this winter.

TWO NEW MARKS.

E. G. BAKER, of Indianapolis, recently rode 72 miles in 50:57, and 94 miles in 1:15:22½ on the Columbus (Ohio) half-mile board track. The previous unofficial records are given as being 53:18 and 1:20:24.

A MOTORCYCLE DAY.

THE directors of the Montgomery County fair, which is held at Coffeyville, Kan., have decided to hold the fair one day longer, and turn the day over to the motorcycle riders. A racing meet is now being arranged.

ARTHUR STANDIN, of Oberlin, Ohio, recently featured at a St. Louis (Mo.) race meet by covering 24 miles in 20:03.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

VARIETY OF IMPROVEMENTS.

HERE are a number of very practical improvements. A front wheel stand and mudguard brace combined is shown at A, and B is an air-chute to the motor; a hole cut in the fender having the edges turned outward to force a column of air against the cylinder. C is an oil pipe from the tank connected to the oil circulating system, and the amount fed is regulated by a screw. D-E is a starting device, consisting of a hand-crank having a ratchet engaging with another ratchet on the crankshaft; a spring keeps the ratchets normally apart. The crank is engaged by pushing in and operates like that on an automobile. F is a foot-board frame of steel tubing attaching at the rear to the rear axle ends and curved over near the fork head and down the opposite side. Clamp fastening is used and cross bracing by tubular stays to the frame give stiffness. The footboard G is of sheet metal 7 inches wide and forms a fender on both sides of the machine, and also acts as a belt-shield. Footboard is stiffened by wood strip on under side.

An emergency foot-brake is shown at H, and also combines a free-engine control. Pushing H forward causes pin I in the brake rod to act on free-engine lever and disengage clutch, while shackle-brake L,

acting on a special belt rim on inside of belt pulley, brakes the wheel. A spring normally holds L out of contact with the rim. The toggle arrangement allows of tightening the belt, and there is an adjustment by holes in the brake rod at the pedal end. The service brake is on the off side and operates the regular coaster by a pedal. Three-inch tires (J) are used and the fenders have sufficient clearance to allow of using tire-chains. K is a side to mudguard continuous on both sides from front to rear of rear wheel. It is hinged at KK to facilitate getting out wheel. M is a slot in the fender to give free movement of saddle springs.

N and O are 2-inch filler caps on the gasoline and oil tanks allowing of easy filling in case a funnel is not at hand. P is a sight-feed oiler, fed by a gear-pump driven by the motor. The feed is thus visible to the rider at all times. Q is a cross-bar brazed to the handlebars to strengthen them, and R a

metal-framed, celluloid wind-shield fastened to Q and braced by rods from the bars. Wind-shield folds on bars when not required. Contributed by Victor Perry, Batavia, N. Y.

PROTECTING RIDER AND DRIVE.

AN enclosed drive, with chain running in oil and case readily removable to replace and adjust chains, protects the rider and transmission likewise. A detachable rear mudguard permits of the tire and wheel being quickly repaired and is essential where a tandem or carrier is fitted. Fastenings are by wing-nuts and slotted lugs. When valve mechanism is enclosed, wear is saved and motor kept free from oil, etc. Lubricating oil tanks should occupy forward compartment of main tank, keeping rider clean and enabling observation and ease in use of hand-pump. Large oilers on front and rear hubs in place of ball-oilers,

etc. Water and rust-proof finish on all parts now nicked, giving a true all-the-year-round machine. Universal lamp brackets and fittings needed. Contributed by Thomas O. Wansleben, Washington, D. C.

TOOL BOX ARRANGEMENT.

IT is the usual but disagreeable fact that the tool one is hunting for is generally at the bottom of the box. Special brackets or hangers should be fitted within the tool-box to carry the tools. The box itself is to be divided into two compartments: One for motor, and the other for tire tools and repair outfit. Submitted by Jean Russell, Brooklyn, N. Y.

SPRING SADDLE FITTING.

A SADDLE supported by double coil springs B and controlled as to fore and aft movement by fitting A. E is a shackle device preventing side rocking. Details enlarged show shackle construction with seat post A and axle B, and coils in springs D. Contributed by Alfred T. Mason, Pittsfield, Mass.

GASOLINE FILTER.

ONE of the vital necessities to the rider, particularly he who tours, is a gasoline filter or strainer. One such device with a settling chamber is here shown, the filtering medium being a chamois disc S. The device consists of two chambers A the filter-chamber, and B the settling-chamber. B has a removable cup G and a rod F which projects into the passage E and holds a steel ball off its conical seat. Gasoline enters from the tank at C, passes through A, and S to P which is connected to the carburetor. On removing cup G, the ball seats itself, closing E, and any water or dirt can be removed from G without leakage from A or interruption of the flow of gasoline to the carburetor. On replacing the cup, the ball is lifted and B again acts as a settling-chamber. Contributed by Chas. R. Chickering, Philadelphia, Pa.

AUXILIARY EXHAUST.

TO decrease the power-loss due to overcoming the inertia of the burning charge during the first portion of the exhaust stroke, the motor can be ported, but to prevent loss of oil, taking in of dirt, etc., the ports should be connected by a pipe to the regular exhaust manifold or pipe, as in the illustration. Contributed by J. H. Measer, Fairmount, Ill.

WANTS PITTSBURGH SANCTION.

W. T. DONOVAN, of 2132 Fairmount road, Cleveland, Ohio, has forwarded an application for a restrictive racing sanction to cover the city of Pittsburgh, Pa., accompanied by a check for \$100. The matter has been referred to the F. A. M. Board of Directors.

MR. AND MRS. CLINTON JOHNSON recently completed a motorcycle trip from Topeka, Kan., to El Paso, Texas, a distance of 1,500 miles.

THE Brockton (Mass.) M. C. recently conducted a successful Sunday afternoon run over 123 miles of sea coast road.

MOTORCYCLES are being used by the officials at the Fort Collins (Colo.) U. S. Experiment Station in conducting investigations throughout the State.

THE PHILIPPINE CENSUS

Motorcycles Registered Under New Motor Vehicle Law Total 287—Climate Hard on Battery Models.

MANILA, P. I.—The Philippine Island authorities have just published the list of motorcycles registered under a new motor vehicle law, passed at the last session of the Philippine Assembly. There were 287 machines registered up to July 31. Of these there are 204 Indians, 51 F. N.'s, 7 Pierces, 5 Humbers, three each Pope and Singer, two each Harley-Davidson, Minneapolis M. M., and Reading Standard, and one each Condon, Emblem, Merkel, N. S. U. and Thor. The machines registered by private owners number 149, the remainder being owned by the different insular government bureaus, provincial governments, Manila police (7) and the U. S. government, War Department (6).

The motor vehicle act does not apply to the Mountain Province or to the island of Mindoro. In the former there are perhaps half a dozen machines. No doubt there are some machines not in use, and these have not been registered. The writer knows of four N. S. U.'s, two Emblems and four Minneapolis models not in service. There are also agencies of the Flanders and Iver Johnson machines in Manila, with demonstrating machines on hand.

The climate here is very unfavorable for the use of battery machines, and machines using belt-drive as a rule are unsatisfactory owing to the rapid deterioration of rubber and leather goods. It is a lucky rider who can get a year's use from either tube or casing—but the riding season in the Philippines, where there are metaled roads, is about 360 riding days. Tires go to the bad rather quicker if they are not ridden than if in constant use.

Of the 287 machines in use here perhaps not more than the odd seven have belt drive, and new machines with battery ignition are practically unsalable. Careful attention to these two points may save intending shippers from disappointment, if they have thought of invading the Philippine market with obsolete equipment.

A CLEAN SWEEP.

BALTIMORE, Md.—The racing team of the Maryland M. C. made a clean sweep of the races at the Timonium Fair, in Baltimore county, on Saturday, September 7. These races were the first of their kind to be pulled off at the fair, and so tickled was the management with the success of the events that an exclusive motorcycle meet will be staged before the winter months set in, probably on Thanksgiving Day. The summaries:

Two-mile novice; Raymond Reckord (Indian), first; Walter Hammond (Indian), second; Carey Mears (Indian), third. Time, 3:16.

One-mile sweepstakes; Freddie Tiemeyer (Indian), first; G. H. Heinz (Indian), second; Reckord (Indian), third. Time, 1:26.

One-mile time trials, flying start; Tiemeyer (Indian). Time, 1:14½.

Three-mile handicap; Reckord (Indian), 25 seconds, first; Tiemeyer (Indian), second; Hammond (Indian), third. Time, 3:57.

The officials were: William Wood, referee; H. M. Gault, G. Brouhard and George Warmbold, timers; W. H. Snyder and George Eliason, judges; E. D. Allard, clerk of course; Howard A. French, starter.

QUESTIONS and ANSWERS

VERY gratifying were the answers to Question No. 4, viz.—What is a flywheel and what are its functions? The question brought out the largest number of answers of any of the series so far and all showed considerable understanding of the dual functions of this important piece of gasoline motor mechanism. In fact, the decision of the Editor was only made after several readings of each of six replies, and the winner was decided to be Lester E. Milkey, of Sandusky, Ohio. The second prize goes to A. F. Clement, of 204 East Franklin St., Mansfield, La.

The Editor of the Questions and Answers Department calls the attention of contributors again to the full answering of the questions to be found in the box below. Incomplete answers disqualify many competitors.

Two cash prizes of \$5 and \$3, respectively, will be awarded every two weeks for the best and second best answers to each question. All the good answers will be published.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the *second* issue following the number in which each question is asked. For example, answers to question Number 6 published in the present issue, will be printed in the October 17 issue. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York."

Question No. 5. Suggest means for improving the typical control system.

Question No. 6. What is the best way to remove and replace piston rings?

FRANK

MERRITT

FLYWHEEL AND ITS FUNCTIONS.

AFTER scrupulous consideration of the replies submitted, the first prize for the answer to Question No. 4—What is a flywheel and what are its functions?—was awarded to Lester E. Milkey, of Sandusky, Ohio, and the second prize was awarded to A. F. Clement, of 204 East Franklin street, Mansfield, La. Milkey's answer is given herewith:

"In the ordinary motorcycle engine there are three idle strokes of the piston for each power or explosion stroke. The respective operations of these three so-called idle strokes are: drawing fresh charge into cylinder; highly compressing this charge, and ejecting the burnt gases after the explosion. It is only natural that some energy must be expended to perform these operations and carry the piston from one power-stroke to the next. This energy is supplied by the fast-revolving flywheel, which is nothing more than a disc or wheel made from iron or steel and securely fastened to or forming part of the crankshaft itself. This flywheel, when the engine is in operation, absorbs part of the force of the explosion and gives it out again as useful energy during the idle strokes. In addition to this the momentum of the flywheel, while turning at a high rate of speed, prevents any sudden increase or decrease in the speed of the engine, thereby making for smooth and steady running of the latter."

Clement's answer was as follows:

"The flywheel is a flat circular piece of cast-iron, having overhanging rims, the weight being chiefly in the rims, giving better balance.

A hole through the center receives one end of the crankshaft.

"In the four-cycle or four-stroke gas engine, there being only one power stroke in the four cycles or every two revolutions of the flywheel, it (the flywheel) serves to counteract the highly varying and intermittent driving force and transforms it into one nearer constant, storing up energy sufficient to carry the rotation through the three idle strokes of exhaust, supply and compression, giving practically uniform speed during the period between impulses, or power strokes."

HONORABLE MENTION.

Honorable mention is due the answer of Wesley G. Paulson, of Pittsburgh, Pa., which explains the action more technically than the average novice can comprehend, owing to the latter's lack of knowledge of physics:

"The action of a fly-wheel is based on the well known mechanical law of inertia—i. e., the tendency of a body to remain in its existing state of motion or repose. The motorcycle flywheel is a mass of metal, set in revolution by the engine on the explosion stroke. Inertia causes the flywheel to continue to revolve after the impetus of the power stroke has subsided, thus furnishing power for carrying out the exhaust, inspiration and compression strokes of the cycle, after which the explosion stroke stores up additional energy in the flywheel, enabling it to continue the cycle of operations indefinitely.

"The amount of energy which the flywheel

may absorb is dependent upon the speed, and the weight, and location of the weight with respect to the center of rotation. A small wheel running at high speed may have as much energy as a large wheel running at slow speed, but the larger wheel would be less responsive to fluctuations of speed and load. To secure smooth and uniform operation of the engine, it is therefore desirable to have heavy flywheels—as heavy as may be consistent with the speed, and strength of the engine parts."

The answer of C. Fluege, of Bronx, New York City, is very good, also, and is reproduced herewith:

"Any four-stroke motor receives but one impulse or explosion to every two revolutions of the flywheel or but one per every four strokes of the piston. In order to carry the piston past the three non-power strokes a heavy flywheel must be used, as it has not only to bring the piston back to the explosion stroke, but must also have momentum enough to oppose the resistance offered to the exhaustion of the burned gases (first upward stroke); the suction of a fresh charge (downward stroke), and finally, the compression of the charge (second upward stroke). These functions must be performed without any noticeable slack of speed of the motor.

"On single and twin motors the flywheels are bored to balance the speed of the motor, but on a four-cylinder motor the flywheel serves to counteract speed fluctuations only. The greater part of the weight of the flywheel is in the rim."

EUROPEAN MACHINES.

RALPH H. REGAN.—Following are the addresses of the leading European makers: **England—Clyno**—The Clyno Engineering Co., Pelham street, Wolverhampton; **Bat**—The Bat Motor Manufacturing Co., Penge, London, S. E.; **Triumph**—Triumph Cycle Co., Ltd., Coventry; **James**—James Cycle Co., Ltd., Birmingham; **Douglas**—Douglas Bros., Kingswood, Bristol; **Rover**—The Rover Co., Ltd., Coventry; **Rudge**—Rudge-Whitworth, Ltd., Coventry; **Singer**—Singer & Co., Ltd., Coventry; **Matchless**—H. Collier & Sons, Ltd., Burrage Grove, Plumstead, London; **Zenith**—Zenith Motors, Ltd., Weybridge; **Germany**—N. S. U.—Neckarsulmer, Fahrradwerke, Neckarsulm; * **Wanderer**—Wanderer Fahrradwerke, Reichnbrand, Sachsen; **Phanomen**—Phanomen Fahrradwerke, Gustav Hiller, Zittau; **Progress**—Progress Motoren und Apparatenbau Gesellschaft, Charlottenberg; **France—Peugeot**—Les fils de Peugeot freres, Valentigny (Doubs); **Griffon**—Griffon, 40 rue Louis-Blanc, Courbevoie (Seine); **Demeester**—Demeester, 22 avenue de la Grande Armee, Paris; **Austria—Puch**—Styria Fahrradwerke, Joh. Puch und Co., Graz, Styria; **L-K**—Laurin und Kelement, Slavia Fahrradwerke, Jungbunzlau, Bohemia; **Switzerland—Motosacohe**—H. & A. Dufaux et Cie, Geneve.

NEW YORK REGULATIONS.

CHARLES W. SMITH.—The speed limit on all streets in Greater New York is defined by a corporation ordinance of the City of New York, which states a maximum speed of eight miles per hour for other than the recognized motor vehicles of the New York State law. The latter does not include the motorcycle under the head of motor vehicles, hence as regards speed, the same limits as are imposed on horse-vehicles, bicycles, and the like, are imposed on the motorcycle. A breach of the corporation ordinance, as when running eight and one-eighth miles per hour, is punishable only by a fine whose maximum is \$10, but whose amount is impossible at the will of the magistrate before whom the offender or al-

leged offender appears. The distinction is not made between first and subsequent offenses, unless by the magistrate in imposing the full amount in the latter cases. In the case of the rider being halted and summoned, on his appearance in court and following a plea of "not guilty," the statement of the police officer is taken in preference to that of the rider, there being no witnesses. Most of the police mounts are fitted with speedometers or odometers, by means of which a conviction is sure; with others, rough estimates of the time taken in pursuit in covering a given number of blocks will generally convict, as the rider generally travels more than the legal limit. The fine is all that the offender is liable to, unless some other breach of the law has been committed in addition (as reckless riding, etc.)

Now as to custom. Most motorcycle policemen will not make arrests, at least in Manhattan, for speeds up to sixteen miles per hour, unless in crowded traffic. It is, however, never safe to exceed ten miles in any of the Boroughs as there are severe as well as lenient officers on post. It would be well to be warned against a plea as to the officer's incorrect estimate of the speed, as such a plea is almost always followed by a good fine. Thus, if A is summoned for riding at sixteen miles per hour, and pleads that the estimate was wrong and that he was doing twelve at the time, he, A, is liable to a fine for exceeding the eight miles per hour maximum in the ordinance. The admission of A that he exceeded the speed limit is not considered as quashing the case on the grounds of misstatement by the officer.

With recognition of the motorcycle as a motor vehicle, the maximum speed would be ten miles per hour in New York county, but under the Motor Vehicle law the motorcycle would be liable to a tax, the rider to taking out a license, carrying an identification number, etc., as is the case in other States. Changes in the New York City Ordinance have been proposed recently, but the above is legal at the present time. We will make public in our columns any and all such changes as they are adopted.

REASON FOR SLOWER RUNNING.

S. M'ALPINE.—You can run the motor slower on battery ignition for the following reason: The vibrator blade in the contact-maker will vibrate even when the cam

takes one second of time to "wipe" it and the vibrations making and breaking the primary circuit in the coil will induce a high-tension current in the secondary winding and sparks will occur at the plug points. Provided the motor will run very slowly the only limit as regards the ignition is the ability of the cam to vibrate the blade to produce sufficient sparks to ignite the mixture in the combustion chamber. With a high-tension magneto, the break is positive at all times and the electric discharge between the plug points is an arc, but below 60 revolutions of the armature per minute a magneto will not generate sufficient current, if any at all. This is with a setting for slow running and hill-climbing. We have seen single cylinder motors ticking round at 100 revolutions per minute on battery ignition, with no load on of course, but doubt very much if such a speed could be obtained with either high or low-tension magneto for jump-spark ignition under similar conditions.

FOUR FLANDERS BOOSTERS.

HERE'S a line of four big healthy fellows of the type which Walter E. Flanders has in his splendid organization. The boys,

from left to right, are L. J. Blundin, Eugene Miller, P. C. Bowen and B. C. Bradford. The photo was snapped at Columbus, Ohio, recently, when the boys were called in for a confab with the district manager concerning the 1913 models of the Flanders line.

BRONZED CYLINDER.

HARRY OWEN.—The bronze color on your cylinder shows that it has been overheated by driving for considerable periods at high speed. You have literally "tempered" it, using the oil as a medium when you pumped it in in excess during the event you mention. Unless the color is very deep, it may not permanently injure the cylinder casting, but you will probably have to get a new cylinder much sooner than if the overheating had not occurred. Gray iron will stand a surprising amount of excessive temperature changes, but is liable to give out suddenly, the cylinder cracking across the chamber or head as a rule. We do not advocate the use of a touring motor for racing, except by the advice of the makers of the motor. A special racing motorcycle will cost between \$400 and \$500, according to the power, etc. Write any leading manufacturer for details.

NORTHERN OHIO AGENT.

C. L. SCRIVENS has accepted the agency for the Triumph in 45 counties in northern Ohio. His headquarters will be in Cleveland, where he expects to open a wholesale and retail distributing house.

A PROPOSED ordinance providing for a license of \$5 on all machines operated in the city is meeting with strenuous opposition from the New Orleans Motorcycle Club

A GARDEN CITY SHOP.

EGGERS & SYLVESTER are proprietors of the Garden City (Kan.) motorcycle headquarters shown in the photograph. Syl-

vester stands at the left; Allen, a local rider, next, and Eggers in the doorway. The machine at the right had just completed the Short Grass tour when the photograph was taken.

Tips and Topics.

AFTER the Tourist Trophy races in July quite a number of inquiries about three-speed hub-gears came to me, accompanied almost always by the question, would I recommend them? And my answer has been that I wouldn't; and these are the reasons. In the first place, the only thing that insulates the gear device from road shocks is the rear tire. Compressed air and rubber and fabric are quite flexible and jolt-absorbing, but they haven't yet been able to preserve a planetary gear from having the pinions put out of line, for any length of time. These hub-gears are planetary type and their efficiency depends on the exact meshing of the various pinions and spur gears, or wear will be great and the noise greater. If any of you remember the little curved-dash runabouts of 1901-2 vintage running on the low speed, you will have an idea on a large scale of the "sweet song of the gears" when worn or not in line; and these three-speed devices use the indirect drive on the high and low speeds, with direct drive on the middle speed. So that for ordinary running on level roads you drive through gears, and climb hills on the direct and on the low (gear) speeds. To get these three speeds means at least seven gear-wheels, and while for a 4 h. mount these would be small and not of much weight, the whole outfit for a 7 h. twin might scale 25 pounds, which is a nice little extra load to put on a rear tire.

How One Machine Acted.

Apart from acting as a further destroyer of tires, the rider who uses such a gear should be given a medal for gymnastics, or for sang froid at least when the pavements are greasy. Mr. Three-Speed Gear snugly fitted in place of the coaster-brake has aspirations toward getting ahead, and as his weight acts like the head of a sledge swung by its handle, the machine and rider often indulge in the "Ostrich Wiggle" on short notice. I remember my first sight of this performance; it was back in 1905 in New York and the late Calbraith Rodgers, who crossed the continent last year by aeroplane, was the star performer. He had a long, low motorcycle, with what was then a huge $5\frac{1}{2}$ h. twin motor and a Roc two-speed gear in the rear hub. This Roc gear had a number of pedals which engaged the two gear positions from the foot rests, and he started the outfit with a crank on the rear axle. Rodgers used to crank steadily until the motor barked, then

yank off the starting crank, leap at the saddle and depart. When successfully done, as his feet struck the rests he executed a sort of clog-dance on three pedals, there was a gritting noise and the machine went forward with a bound. This was engaging the high gear, he told us. After riding on the asphalt for a while, he struck a patch where the watering cart had been and the "Wiggle" commenced. In spite of another hoe-down on the pedals, Rodgers' machine made two revolutions, and he continued on at an angle, diving into the back of a cyclist and coming down uninjured. I got to the machine and twiddled everything on the handlebars, finally stopping the motor. Rodgers explained when he got up that this was the usual thing with the gear-in-the-hub and that he was learning to fly. We noticed that the next machine he bought did not have a hub change-speed gear. Since then I have not been much in favor of this location for the gear, and more recent happenings of a like nature have only strengthened my dislike. "Britisher," in his interesting notes in *MOTORCYCLE ILLUSTRATED* has mentioned similar experiences.

An Inconvenient Location.

Then there is another thing—getting out the rear wheel. It takes the English rider one hour and a half to replace a tire with a hub-gear fitted; there are a number of rods and bell-cranks to disconnect and connect up during the process. With a powerful twin, again, there is no need of three speeds, two—a low and a direct high—are all that are needed. So I do not think that the three-speed gear in the hub will ever become popular, and I stick to my original statement that I don't recommend it. The gear device ought to be located on the bottom bracket or countershaft, if anywhere.

I spoke of the coaster-brake a little while back. There really ought to be three arms per rider when some of them are to be fixed. Most riders do not carry a vise with them and I have several times assisted in fixing a nut on with one hand while compressing a spring with the other, and all this while the rider was fitting on the braking member. How a single, two-armed man could perform these operations all at once is a mystery. We shall see whether any rider can suggest a remedy for this, in the near future.

I have been accused of being unpatriotic a number of times because I did not see the beauties of certain devices fitted to American machines. I still do not see why you should have to push on the rocker which lifts the exhaust valves, instead of pulling on it. To push isn't any easier than to pull; in fact it is harder, and yet, you find lots of machines where the lifting motion is a pushing one. If the rocker arm

is turned over 180 degs. anyone can convert the motion to a pulling one and use a spring, if necessary to bring the rocker backward and drop the valves. And the lifter is connected up to the grip where the leverage is small, making the work of lifting fairly hard.

I guess that the edge of my axe is pretty dull now, but it is pretty hard not to try to make things easier for the motorcyclist, even if it's only a matter of reducing the motions of his hands. When you are not built in the shape of a wedge with small hams on the business ends of your arms, little refinements in control, steering, etc., appeal strongly to you.

A Handy Drill Wrinkle.

You can't feaze a first-class motorcyclist, as a rule. A short time ago one rider wanted to fit an auxiliary air-valve to his single cylinder motor, but found only a taper-tap at hand. The valve dome luckily was of soft brass and a belt drill was borrowed, it being nearly the right size for

the thread of the little revolving-cover grease-cup used for the air-valve. The drill had a T-handle; this was fitted into the jaws of an ordinary bit-brace and the hole bored. A nail-file enlarged the hole until the tap could bite, when the thread was cut and the "valve" screwed in. The position of the valve in the dome was such that it could be used for priming also, dropping the gasoline on top of the automatic inlet valve.

Speaking of Antecedents.

Our big brothers, at least that is what they are pleased to call themselves, the automobilists, in some parts of the country are getting over their patronizing way of looking down on riders of the two-wheeler. Some of them are dickering now for interest in the manufacture of the single-tracker; but the drivers are getting to be more tolerant in their attitude to those who ride the roads than before. This in part is due to the growing use of the motorcycle
